* This table consists of actual trial data, excepting the *Rurik* and *Powerful*, given as designed.

Cruisers of the U. S. Navy.—The armored cruiser *New York*, begun in 1890 and completed in 1893, is of the same type as the *Blake* and *Blenheim* of the British navy, but slightly inferior in size and battery-power. She has an armored protective deck the whole length of the ship, extending 4 ft. 9 in. below the water at the side to a foot above the

water amidships; it is 6 inches thick on the slopes, 3 inches at the flats, reduced to 2½ inches at the ends of the vessel. In addition to this there is a belt of 5-inch armor in wake of the machinery spaces between the protective and main decks. Behind this belt is a cofferdam or cellular space 3 ft. 6 in. deep, extending all around the ship, filled with cellulose, a very light and water-excluding material. The armament consists of six 8-inch guns, two mounted in a barbettes forward plated with 10-inch armor, two similarly mounted aft, and one on each broadside amidships on the spar-deck. Twelve 4-inch rapid-firing guns are mounted in sponsons of 4-inch armor on the main deck, and eight 6-pounder guns in 2-inch armored sponsons on the same deck. The 8-inch guns are 25 feet and the 4-inch guns 16½ feet above the designed load-line. There are six torpedo-tubes for ejecting Whitehead torpedoes above the water-line, one forward and one aft and two on each broadside. There are twin-screws, and each screw has two sets of three cylinder triple-expansion engines, making four sets of engines, each in a separate water-tight compartment. It is estimated that the vessel can maintain at sea a speed of 18-5 knots.

The first-class cruiser *Brooklyn*, authorized in 1892 and begun in 1893, is similar in design to the *New York*, but of greater size and armament.

The *Columbia* was built for the express purpose of preying upon commerce, and when begun in 1890 it was stated by the Secretary of the Navy that "no merchant vessel that she meets, armored or unarmored, can escape from her." She and her sister ship, the *Minneapolis*, are of 7,375 tons displacement, 412 feet long, 58 ft. 2½ in. beam, and 22 ft. 6½ in. draught. The *Columbia* is expected to maintain at sea a speed of 21 knots an hour. There are three screw propellers, one placed amidships as in ordinary single-screw ships, and one on each side, slightly forward of the middle screw. Each screw has a separate triple-expansion engine in an independent water-tight compartment. All the motive machinery and boilers are below the armored deck, which is 4 ft. 6 in. below the water-line at the sides and 1 foot above amidships; the slopes are 4 inches thick, and the flat 2½ inches. There is a cellular structure 5 feet wide extending the whole length of the ship at the outer edge of the protective deck. The coal carried at the designed draught is 750 tons, and the total capacity of the bunkers is 2,000 tons. The battery of this vessel is a light one, being only intended to cope with small cruisers and armed merchantmen; it consists of two 40-caliber 6-inch guns mounted in the open on the spar deck forward, one 8-inch gun aft, eight 4-inch rapid-firing guns in 4-inch steel sponsons on the main deck, and eighteen machine-guns of various sizes.

Growth of the U. S. Navy.—The navy of the U. S. began modern construction in 1883 by the building of the cruisers *Chicago*, *Boston*, and *Atlanta*, and the dispatch-boat *Dolphin*. During the period of the building and completion of these ships it became necessary also to establish in the U. S. the manufacture of the class of steel of which such vessels were built, and the construction of modern ordnance and ammunition. At this time twenty-five years had elapsed since the construction of powerful modern iron-

clads was begun abroad, and during the greater part of that period, since the close of the civil war, none of the new types of war-vessels had been built in the U. S., and the republic was absolutely without rank as a naval power. In effective force the navy was in 1888 rated as nineteenth among the nations. Thus the U. S. followed Japan, Turkey,

Greece, Brazil, Chili, and Portugal. In 1895, counting as *active* the vessels built and building, the U. S. takes rank as a naval power fifth among the nations, in the following order: Great Britain, France, Russia, Italy, U. S. This classification is probably an unduly favorable comparison which does not actually represent the rank for active service, on account of the large proportion of vessels incomplete.

Evolution of development of Warships.—The gradual increase in the working-pressure of steam, with the single engine, the consequent introduction of the compound engine, which has come into practical use since 1870—largely developed into the triple-expansion engine—and the continued rise in the steam-pressure since, have produced two very important effects: (1) A reduction in the expenditure of coal, making longer voyages possible, or increasing the endurance under steam and decreasing the necessity of sail-power, which is destructive to speed and hampers and obscures the battery; (2) a reduction in the weight and space occupied by the machinery, both of which are most important elements in the efficiency of a man-of-war. The type of engine most in use at present for ironclads is the three-cylinder vertical inverted-cylinder engine, and the triple-expansion principle is almost universal. The piston speeds employed vary from 500 to 900 feet per minute, and are continually increasing with improvement in machinery and the increased use of steel; the faster the engines run the smaller and lighter the parts. The French type of boiler is generally employed, carrying 180 to 190 lb. per square inch of steam-pressure and burning 16 to 20 lb. of soft coal per square foot of grate per hour with natural draught. Such engines usually develop as much from 6 to 10 indicated horse-power per square foot of grate surface of the boilers, and the usual weight of the above types of machinery, engines, and boilers, including water, is from 250 to 290 lb. per indicated horse-power under natural draught. The French have adopted in several new vessels a type of multitubular boiler which effects a great reduction in weight of boilers and contained water. The type of boiler moves with increasing favor, and is being fitted in the latest and more powerful cruisers building.

The use of forced draught, by making the boiler communicate directly and forcing large volumes of air into them, has recently been revived, and is now an element in the design of all modern war-vessels, enabling them, by a largely increased consumption of fuel, to develop about from 30 to 50 per cent. more than the ordinary maximum power of the machinery for a few hours in cases of emergency when the greatest available speed is required. This method of forcing the fire was used so long ago as 1859 in U. S. river-vessels, but was first used by the French in war-vessels. It was the subject of considerable experiment in the British navy in 1865, on the *Unconquer*, the *Satellite*, and other vessels, in which the indicated horse-power per square foot of grate was increased from 6 to 10, under natural draught, to 16 with an atmosphere in the fire-rooms equivalent to a column of 14 inches of water. These experiments once led to the introduction of the system in all new war-vessels built, owing to the rapid deterioration of boilers subject to great forcing, its use has been carefully restricted.

In unarmored vessels horizontal engines are used only where necessary to get the machinery below the water-line and beneath the protective deck. Short-stroke vertical internal engines are more generally employed on account of their greater simplicity and endurance, and because of their less weight and bulk for corresponding power. Warships of over 1,500 tons displacement are now almost invariably provided with twin-screws and have two complete sets of propelling machinery, in separate, water-tight com-

partments, by which arrangement the danger of total disablement is reduced to a minimum. Twin-screws offer the additional advantage that they admit of adequate protection to the rudder and the steering gear, which is impossible in an unarmored single-screw ship and difficult to accomplish in an armored vessel. They also furnish a valuable auxiliary steering-power, and are equally efficient as propellers in comparison with the single screw. The system of trials of steamships initiated in the U. S. by Chief Engineer B. F. Isherwood, U. S. navy, but never developed, although for years in vogue in Europe, has done much toward economy in the expenditure of the power of marine engines and the determination of the power necessary for certain speeds of ships. In 1874 the system of obtaining the resistance of ships by towing models, established by William Froude in Great Britain, was confirmed by towing a full-sized ship, the *Greyhound*, and is now regarded as a means of immense advantage in design of ships. It forms the basis of the progressive speed-trials of the ship over a measured distance in smooth water, at which all data can be obtained under uniform conditions, and in a systematic manner.

Materials of Construction.—Since 1876 rapid progress has been made in the use of mild steel or ingot iron. This metal is chiefly produced by the open-hearth process, cast into large ingots, and then rolled into plates or shapes. It has not the distinctive property of tempering peculiar to steel, and contains from 12 to 20 of 1 per cent. of carbon. It is very ductile and malleable, and can be produced in large quantities of uniform quality; it has 55 to 80 per cent. greater tenacity than the best iron ship-plates, and is only 2 to 24 per cent. heavier for equal volume. The cruizers began in 1880 for the U. S. navy were the first in the U. S. built throughout of mild steel. The elaborate tests made by the Government have shown an average ultimate tensile strength of about 60,000 lb. per square inch, and an elongation under tension of 25 per cent. in a length of 8 inches. The use of this material, while adding considerably to the strength of a vessel, from its great ductility and uniform strength in all directions, enables a reduction in the weight of the structure of from 10 to 14 per cent. over that of iron. This fact led to its use even when the steel cost much more than iron. The cost of manufacture is so much less that it has practically replaced iron as a structural material.

The remarkable developments in ocean steamships and in ironclad and unarmored war-ships could never have been attained if wood had continued to be the material of construction. In wooden ships the limits of size and of proportion were practically fixed by the capabilities of the material of which they were built, but in iron ships the designer is left free to adapt such dimensions as will conduce to efficiency, safety, and economy. The greater strength of iron and steel, and increasing skill in the fashioning and disposition of the material in the structure of vessels have led to a continuous increase in the size of ships, which, combined with the corresponding decrease in the proportion of weight of hull to weight carried or in the load-displacement, has largely increased the efficiencies of ships—that is, it has increased their speed, both from absolute size and greater available weight for machinery, and their war-power by increased proportion of weight of armor and batteries. The decreased weight of hull, with, also, a gain in structural strength, has had equally remarkable effects in small as in large vessels, for through no other means could a torpedo-boat 63 feet long, weighing but 12½ tons, capable of a speed of 18 knots an hour, stand the strain of the machinery and be sufficiently strong to be lifted from the water to rest on crutches on board an ironclad.

ARMORED VESSELS.*

* In the table names of ships building or being rebuilt April, 1895, are put in italics; h. p. = between perpendiculars; B. L., broad beam; G. S., gun deck; S. L., steam-turbine; M. L., machine-loading; * length on water-line; † with forced draught; ‡, minimum.

FRANCIS T. BOWLEN.

Ship-worm: any bivalve of the family TEREDINIDÆ (q. v.).**Shipwreck** (in law): See WRECK.

Shiras, GEORGE, JR., LL. D.: justice U. S. Supreme Court: b. at Pittsburg, Pa., Jan. 26, 1832; educated at Ohio University, at Yale College, where he graduated 1853, and at Yale Law School; admitted to the bar at Pittsburg and practiced in that city; appointed associate justice of the Supreme Court of the U. S. July 19, 1892. The degree of LL. D. was conferred upon him by Yale University in 1883. C. H. T.

Shiraz, shee'raaz, or **Sheeraz**: town; capital of the province of Fars, in Persia; in lat. 29° 36' N. and lon. 52° 44' E. (see map of Persia and Arabia, ref. 4-H); situated at an elevation of 4,500 feet above the sea, in a valley made familiar by Moore's *Lalla Rookh*, and still celebrated for the abundance and excellence of its fruits of every description. Founded in 697, it was during more than five centuries a favorite residence of the Persian princes, and a seat of science and art. Sa'di and Hafiz were born, lived, and died here. Shiraz contains the tomb of Hafiz, and that of Sa'di is a few miles to the N. E. The city suffered fearfully from earthquake in 1812 and again in 1824. Rebuilt, it was almost destroyed by another earthquake 1853. It was again rebuilt, but on a less extended scale. Its manufactures and trade have greatly declined, but its wine, rose-water, carpets, and inlaid work are still famous in the East. Pop. about 25,000. E. A. GROSVENOR.

Shire: See COUNTY.

Shiré, shee'ra: river of Southeastern Africa, issuing from the Lake of Nyassa, in lat. 14° 28' S. It flows with many rapids and cataracts from the elevated plateau of the interior into the flat coastland, where it forms a broad, calm stream, navigable for the largest vessels, and joins the Zambezi about 90 miles above its mouth.

Shirlaw, WALTER: genre-painter; b. at Paisley, Scotland, Aug. 6, 1838. His parents removed to the U. S. in 1840, and in time he became a bank-note engraver; in 1870 he went to Munich, where he was a pupil of Raab, Wagner, Ramberg, and Lindenschmidt; became a National Academician 1888. His *Sheep-shearing—Bavarian Highlands* (1876), exhibited in 1877 at the National Academy, New York, attracted much attention. As an illustrator his designs for Goldsmith's *Hermit* are notable. Studio in New York. W. A. C.

Shirley, JAMES: dramatist; b. in London, Sept. 13, 1596; educated at Merchant Taylors' School, St. John's College, Oxford, and Catharine Hall, Cambridge; took orders in the Church of England, and obtained a curacy in Hertfordshire, but soon vacated it by becoming a Roman Catholic; taught for some time a grammar school at St. Albans, but, being unsuccessful, became a dramatic writer in London; had produced thirty-nine plays before the Great Rebellion; founded a classical academy at Whitefriars, and wrote several grammatical treatises. D. in London from exposure

consequent upon the great fire of 1666, and was buried Oct. 29. His *Dramatic Works and Poems* (6 vols., 1833) were first edited by Gifford and Dyce. He is regarded as the last of the Elizabethan dramatists. *The Traitor* (1631) is, by common consent, his best tragedy, and *The Lady of Pleasure* (1635) his best comedy. Revised by H. A. BEERS.

Shirley, WILLIAM: colonial governor of Massachusetts: b. at Preston, Sussex, England, in 1693; became a lawyer; settled in Boston, Mass., 1734; was commissioner for fixing the boundary-line between Massachusetts and Rhode Island; was royal governor of Massachusetts 1741-45; planned the successful expedition against Cape Breton 1745; was in England 1745-53; returned to Massachusetts as governor in the latter year; treated with the Eastern Indians 1754; explored Kennebec river, erecting there several forts; was commander-in-chief of the forces in British North America at the outbreak of the French war 1755; planned the expedition of Gen. Prideaux against Niagara, and proceeded himself as far as Oswego; was appointed lieutenant-general 1759; became afterward governor of the Bahama islands, but returned to Massachusetts, where he built a fine residence at Roxbury. D. at Roxbury, Mar. 24, 1771. Author of *Electra*, a tragedy; *The Birth of Hercules*, a masque; *A Letter to the Duke of Newcastle, with a Journal of the Siege of Louisbourg* (1745); and *The Conduct of Gen. William Shirley briefly Stated* (1758).—His son WILLIAM, an officer in the army, was killed at Braddock's defeat 1755.—Another son, Sir THOMAS, b. in Boston, became a major-general in the British army, was created a baronet 1786, and was governor of the Leeward islands. D. Mar., 1800.

Shir'wa: lake; a little S. E. of Lake Nyassa, Southeast Africa; formerly supposed to have as its outlet the Lujenda river, but discovered (1887) to be nothing more than a huge evaporating-pan with an area of about 350 sq. miles, into which a number of small rivers discharge. Its waters are brackish, are gradually drying up, and there is evidence that formerly the lake stood at a much higher level and discharged into the Lujenda river. C. C. A.

Shi'shak: the Hebrew name of the Egyptian king *Shashank*, first ruler of the twenty-second (Bubastite) dynasty (966-800 B. C.). He was probably of Libyan lineage, and at the close of the twenty-first (priestly) dynasty grasped the royal power which he had actually wielded previously. This was largely due to the increased influence of the Libyan mercenaries from whom the Egyptian army had been recruited since the time of Seti I. and Ramses II. The dominion of Egypt was much extended by Shishak, who waged war in Palestine against Rehoboam, King of Judah. His inscriptions on the south wall of the Temple of Amen at Karnak contain the names of 128 cities or regions in Palestine and Syria which fell into his hands. The list is really larger, but a considerable number of names are no longer legible. Jerusalem was among the captured places.

and from it he removed much land (1 Kings xiv, 25, 26). Jeroboam, who had fled from Solomon, sought protection in Tyre, under Hiram (1 Kings x, 15), and later upon the accession of the Hebrew nation became king of the realm, presumably with the support and aid of Hiram. The name also belonged to the fifth, seventh, and ninth kings of the twenty-second dynasty, but particulars concerning them are meagre; beyond the statement that the last two reigned fifty-two and thirty-seven years respectively. Their period is one of the darkest and least known in Egyptian history. (CHARLES R. GILLIES.)

Shil'han: (1) wood of the shillal-tree, reputedly mentioned in Exodus as the timber principally employed in building the tabernacle. It has been identified with the *domin ayal*, which abounds in the Sinai peninsula. The wood is light, fine-grained and enduring, and of a fine orange-brown. The leaves are small, and in spring the tree is covered with tufts of yellow blossoms. It yields the gum arabic of commerce. (2) A fertile plain, so called from its acacia-groves, just opposite Jericho, in which the Israelites were encamped before crossing the Jordan. There the Israelites fell easy victims to the seductions of the Moabite women, who prostituted themselves in honor of their god Baal-peor, and there the punishment followed on them and on the Midianites (Num. xxi, xxxi, 1-12). There went the spirit to Jericho (Josh. ii, 1). Revised by S. M. JACOBSON.

Khu'a: the most southern part of the Abyssinia highland, East Africa; formerly an independent state, but since 1888 a part of Abyssinia, the rule of its king, Menelik, having been extended over the whole of Abyssinia, except the northern district, appropriated by Italy. The whole territory of the king became (1890) a protectorate of Italy. The capital and chief residence of the king is Antotto, and there are several other large towns, of which the most important are Ankober and Hoaghe, situated about 8,000 feet above sea-level. The soil is very fertile, and most of the inhabitants are Catholic Christians. Pop. less than 3,000,000. Area about 15,000 sq. miles. (C. C. ADAMS.)

Shuals, Isles of: See ISLES OF SHUALS.

Shock (from M. Dutch *schok*, a bounce, jolt; O. H. Germ. *scoc*, a swing; cf. O. Eng. *scoca*, shake, and Fr. *choc*, collision (from M. Dutch) 1) sudden vital depression, the peculiar effect upon the animal system produced by violent injuries. Surgical shock must be distinguished from mental shock, caused by grief, terror, or other mental emotions. Following serious accidents, the crushing of a limb by a railway injury or its removal by a cannon-ball, extensive superficial lacerations, extensive surgical operations, as amputations or hysterectomy, and as the result of blows over important organs, concussion of the brain, a kick or sudden blow in the region of the stomach over the solar plexus—a powerful impression is made on the nerve-centers proportionate to the extent of the superficial or peripheral excitation. The condition is induced by paralysis of the vaso-motor centers, but is not limited in its manifestations to the nervous system, all the tissues of the body being affected in sympathy with the injured part. The symptoms of shock are extreme pallor and coolness of the face and surface of the body, a small, feeble, slow pulse, infrequent and often irregular respiration, pinched features, cold sweat, and the appearance of impending dissolution. If the bodily temperature falls more than 2° F., death is apt to follow. In special cases, delirium, hiccup, or convulsions are present. The circulation and respiration may be so depressed that death is immediate, or speedily ensues unless reaction is artificially hastened. Sensation of pain is annulled: in the utmost injury, as the laceration and removal of a limb by a cannon-ball, there may be no pain and no loss of blood during the period of shock. The period of shock, if survived, is followed by reaction, a resumption of ganglionic or central nerve-power, and revival of the dependent functions. Extensive loss of blood renders the patient more susceptible to shock, predisposing sudden assemia, inanition, and disturbed action of nerve-centers. Concussion of the brain is often accompanied by shock, but is in itself an entirely distinct condition. Exposure to cold increases shock, and is particularly to be avoided in operations. No satisfactory lesson or organic change has been found to explain shock, the only marked post-mortem lesion being distension of the right side of the heart and great venous trunks with blood, sometimes fluid and always coagulating with difficulty. The treatment of shock is to be directed to the immediate development of reaction. The sinking pulse must be rallied

by ammonia and alcohol, by stimulating stimulants by heat to the extremities and surface. Hypodermic injections of digitalis, atropia, strychnia ether, or brandy are often used. Quinine is sometimes given before an operation as a prophylactic. In mild cases of shock external warmth, a little diffusible stimulant and rest are all that is required. Reaction is sometimes excessive, the patient passing into a condition of trematous delirium, or may be imperfect, when he falls into the state of prostration with exsanguination. What is called secondary or lightning shock is due to the terminal hour of desaturation, and often proves fatal.

Revised by JAMES ANNANDER, Jr.

Shoddy (originally, the wool that was shed or wanted in carding and spinning); in a stricter sense, a fiber made by tearing in pieces in a suitable mill bags of woollen or combi-wool goods. The corresponding fiber of carded-wool rags is called mungo; but more frequently both kinds are classed together as shoddy or "devil's dust." Some classes of useful goods can not be profitably made without shoddy, and if used in reasonable proportion the pressure can not be detected, and the wear of the goods is not much diminished. None but the very best sorts of woollen goods are perfectly free from shoddy.

Shoe [O. Eng. *shōc*; O. H. Germ. *schuh* (cf. Mod. Germ. *schuh*); Ital. *scar*; Goth. *skōh*]; in general, any covering for the foot (with the exception of *boots*) of which warmth and protection are the special purposes. If the foot-covering encloses mainly a sole, it is called a sandal; if it also has a part coming up to the ankle, it is called a shoe; while one that covers a portion of the leg is called a boot. (See *boots*.) A loose light shoe into which the foot may be easily slipped is appropriately called a "slipper." The earliest form of the shoe was the simple sandal, which was secured to the foot by thongs, and often by a lashing running between the first and second toes. Almost every material has been used for the construction of shoes, the skins of animals, tanned or untanned, more frequently than any other. In some parts of Europe wooden shoes, or *sabots*, are very common among the poorer classes. In Japan the sandals worn by the common people are made of straw; in South America they are made of plaited thongs of hemp. There have been great changes in the forms of shoes as worn in different countries and at different periods among civilized nations. The early Greeks usually went barefoot, or confined themselves to simple sandals, which in time came to be highly ornamented. The early shoes of the Romans were buskins, not very dissimilar to the moccasins of the American Indians; thick soles, sometimes of metal, were a later invention. In time they grew into shoes, or even boots, sometimes covering the entire leg. In Europe, during the Middle Ages, shoes often were made in fantastic shapes. At one time they had pointed toes about two feet long, which were often brought up and tied to the knee; and not infrequently a man of fashion would wear them of different colors, as a red one on one foot and a yellow one on the other. For many years there has been very little change in the general form of the covering for the foot as worn by either sex; the main variations being in the height of the heel and the shape of the toe, whether pointed, round, or square.

Manufacture.—A boot or shoe consists essentially of two parts, the sole, almost universally made of thick leather, and the upper, usually of a softer leather, but not unfrequently of cloth of some kind, for women often of silk or satin. These parts are attached to each other in various ways, usually by sewing. A few years ago a boot or shoe was made throughout by a single person; at present the production of a shoe is the work of several persons, each performing only a single part of the operation, a considerable portion being done by ingenious machinery. Indeed in no single trade is there a more perfect division of labor or a greater adaptation of machinery. Boots and shoes put together by pegging were in extensive use a few years ago. Now only some of the cheapest grades are pegged, much of the work being done by the pegging-machine invented by A. C. Gallatone in 1851. Pegging, however, as a method of fastening the soles to the uppers, has been almost entirely superseded by a process known as the "stand-and-screw," in which the outer soles are fastened to the inner soles and the uppers by a machine that uses a threaded brass wire, which is supplied from a reel. In the performance of its work the machine threads a portion of the wire into the substance of which the shoe is composed, gives it a half turn, and automatically discharges it. An-

other important invention is that of a machine for sewing soles, which was improved by Gordon McKay. One of these machines in the hands of a good operator will easily sew on the soles of 800 pairs of women's shoes in ten hours. Originally, shoes made by the McKay process were not so well finished as to the inner part of the sole where the stitches came through, but this defect was overcome by the use of a smooth inner sole, cemented to the sole in such a way as entirely to cover the stitches. A later and more important invention is that of the Goodyear welt machine, as it is called, which has enabled manufacturers of shoes to produce footwear so closely resembling hand-work in appearance and durability as to render it extremely difficult to distinguish one from the other. Indeed in the best grades what difference exists may be fairly said to be in favor of the machine-sewed goods. A great part of the boots and shoes used in the U. S., especially the finer kinds, are made in large establishments in New York, Philadelphia, Baltimore, and other large cities, but more in several towns in Massachusetts, Maine, and New Hampshire; Lynn, Mass., is the greatest seat of this manufacture, and among the other large centers are Haverhill, Brockton, Milford, Marblehead, Worcester, Braintree, and Danvers, in Massachusetts; Portland, Augusta, and Lewiston, in Maine; Dover and Farmington, in New Hampshire. Until about 1890 the U. S. did but little export business in boots and shoes.

Revised by VAUGHAN SNIDER.

Shoebill: a large wading bird (*Baleniceps rex*) inhabiting the region of the White Nile, Africa. It is named from its large, peculiarly shaped beak, and is also termed whale-headed stork, although its affinities are rather with the herons. It stands nearly 5 feet high, is gray, and has a little recurved crest. F. A. L.

Shoebill.

Shoeburyness: a promontory in the county of Essex, England; on the northern shore of the estuary of the Thames, directly opposite Sheerness (see map of England, ref. 12-L). Shoeburyness was selected by the Government as the locality of experimental firing at armored targets and for trial of new guns. It is the seat of a school of gunnery, with artillery, barracks, batteries, targets, etc.

Shoeing of Horses: See FARRIERY.

Shōgun (Jap., liter., general, the Chinese *Tsiang-K'ün*): a Japanese military title, said to have been first employed by the Emperor Suijin in the first century B. C., when he divided the empire into four military divisions. The name began to have a political significance with YORITOMO (q. v.), who was appointed in 1192 *Sei-i-tai-Shōgun*, or generalissimo, against the barbarians. Henceforward the shōgunate more and more represented the real governing force in the empire, until in the seventeenth century the Tokugawas (see IYEWASU) became a real reigning dynasty. The empire was centralized afresh from Yedo, so that in 1868 when the emperor resumed power he merely fell heir to the bureaucratic system developed by these rulers. J. M. DIXON.

Sholapur: district and city in the southern part of the Bombay Presidency, British India; on the border of Haidarabad. The district lies between the parallels 17° 13' and 18° 35' N.; has an area of 4,521 sq. miles; is bleak and treeless, and generally flat or slightly undulating, and is subject to great irregularity in the amount of rainfall, making agriculture dependent on irrigation. Its silks, finer cotton cloths, and blankets have a good name, and the chief exports besides cloths are oil, oil-seeds, ghee, and turmeric. The population numbers about 600,000, mostly Hindus. The city of Sholapur, chief town and administrative headquarters of the district, is in lat. 17° 40' N., lon. 75° 57' E., near the Sina river (see map of S. India, ref. 4-D). It is a station on the Great Indian Peninsular Railway. It is one of the principal cotton-markets of the Dekkan. Pop. (1891) 61,915.

MARK W. HARRINGTON.

Sho'mer, Shammer, or Jebel Shomer: a territory, part of the great central plateau of Arabia; bounded N. by the Syrian desert, from which it is separated by mountains

9,000 feet high, N. E. by Irak Arabi, S. by the sultanate of the Wahabees, and W. by Turkish Arabia. The Arabs here have always remained in a savage condition, little influenced by the rise of the Mussulman empire. About the end of the eighteenth century they came under the power of the Wahabees, but since the overthrow of the latter have been independent. The country is divided into five provinces, said to contain eighty-six towns and villages, the chief of which is Hayel. Between it and Medina considerable trade is carried on. Corn and fruit are raised by artificial irrigation. Dates, cotton, horses, and asses are exported. Pop. of territory estimated at 450,000. E. A. G.

Shore: See COAST.

Shore, JANE: mistress of Edward IV.; b. in London, England, about 1445; married a rich London goldsmith named Matthew or William Shore; became mistress of King Edward IV. about 1470, and of Lord Hastings after the death of the former, 1483. She was accused of witchcraft as an accomplice of Hastings, who was beheaded for that pretended crime, though the real reason for the proceedings against them was their known partiality to the cause of the young princes. According to More's account, Jane Shore was charged by King Richard III. with having withered his arm by her arts of sorcery; was committed to the Tower and her property confiscated; was never brought to trial, but was compelled by the Bishop of London to do public penance for impiety and adultery. The king's solicitor, Thomas Lynon, desired to marry her after the death of Hastings, but Richard tried to dissuade him, and whether the marriage took place is not known. She survived until after the accession of Henry VIII., and popular legend represented her as having died of hunger in a ditch—a version which long retained currency through the famous drama of Rowe bearing her name; but the legend was probably derived from the name of a London locality still called Shoreditch. Sir Thomas More bears emphatic testimony to her beauty, kindness, and wit.

Shore, Sir JOHN: See TEIGNMOUTH, BARON.

Short, CHARLES, LL. D.: educator; b. at Haverhill, Mass., May 28, 1821; received his early education at Bradford Academy and Phillips Andover Academy; graduated at Harvard 1846; classical instructor in Roxbury and Philadelphia 1847-63; president of Kenyon College, O., and Professor of Intellectual and Moral Philosophy 1863-67. On the death of Dr. Anthon, Professor of Greek in Columbia College, New York, Dr. Henry Drisler was transferred to the Greek chair, and Dr. Short succeeded Dr. Drisler as Professor of Latin in 1868. He edited, with additions, *Advanced Latin Exercises* in Schmitz and Zumpt's Latin Series (1860); revised Mitchell's *New Ancient Geography*; wrote an elaborate essay on the *Order of Words in Greek*, prefixed to Dr. Drisler's edition of Yonge's *English-Greek Lexicon* (1870); and, with Charlton T. Lewis, revised (1879) Andrews's *Freund's Latin Dictionary*. He contributed many articles, mostly critical, to reviews and other periodicals, chiefly to the *Bibliotheca Sacra*. He was from the outset a member of the American committee co-operating with the British committee in the revision of the English Bible. D. in New York, Dec. 24, 1886.

Revised by BENJ. IDE WHEELER.

Short, WILLIAM: diplomatist; b. at Spring Garden, Va., Sept. 30, 1759; studied at William and Mary College; was at an early age a member of the executive council of Virginia; accompanied Thomas Jefferson on his embassy to France as secretary of legation 1784; was appointed *chargé d'affaires* to France by Washington 1789 (being the first commission signed by him as President), and was subsequently minister to the Netherlands and to Spain, where in 1795 he concluded the negotiations which resulted in the treaty of friendship, commerce, and boundaries. D. in Philadelphia, Pa., Dec. 5, 1849.

Shorthand: See PHONOGRAPHY and STENOGRAPHY.

Shortorns: a breed of beef-cattle which originated in the valley of the river Tees, between the counties of Durham and York, in England. They are often called Durham, shorthorned Durham, and Teeswater cattle. Since very early times the cattle of the northeastern coast of England have differed in type from those of other parts of Great Britain, and there are many reasons for believing that this is due to an admixture of the blood of the cattle of the adjacent countries of continental Europe, brought over at the time

of the French invasion. At all events, in their large size, heavy heads, short horns, and angular forms the short-horned cattle of this part of England closely resemble the Danish, Devon, and Flemish races of cattle. Durham, Yorkshires, and Northumberland have long been famous for the amount and superior quality of the beef produced there, and early in the eighteenth century numerous breeders became famous for the size, quality, and great fattening propensity of their cattle.

However, it is to a few men who were in active life in the closing years of the eighteenth century and the early part of the nineteenth that most of the fame of the breed as we now know it is due. The sires famous of these men were Charles and Robert Colling, Thomas Bates, and Richard and John Hoadly. The Collings were the earliest improvers of the short-horns. Charles in particular produced extensively and with great skill the closest fattening in the foundation of all or nearly all his various families. The bull Comet brought at public sale in 1810, when six years old, 1,000 guineas.

Two Durham Ox and The White Heifer that Traveled, animals sent by Charles and Robert Colling respectively, were esteemed to a great weight, and were taken from town to town to be exhibited. Their fame had a great effect in making the breed widely known throughout Great Britain. The Durham Ox, supposed to have been the largest animal of the cattle kind ever bred up to that time, is estimated to have weighed 3,400 lb.

The most famous family of the short-horns is that known as the Duches, or Basse Duches. They are descended from a cow, Duches, that Charles Colling bought from the Warwick estate of the Duke of Northumberland, and the bull Huddock and Favourite. They were closely inbred by Colling, and afterward by Thomas Bates, who for nearly forty years (1810-50) bred this family with scarce an admixture of outside blood. After Bates' death some of the best representatives were taken to the U. S., where they were still kept pure in the hands of Samuel Thorne, of Thomdale, Durham co., N. Y., J. O. Sheldon, of Geneva, N. Y., and William and Campbell, of New York Mills. Their fame grew both in the U. S. and in England, and culminated in 1874, when the eighth Duches of Basse brought at public sale \$30,000.

Short-horns are large, round-bodied, squarely built animals, maturing early, and producing large amounts of best-quality beef. In color they are red, white, or any admixture of these two colors. Red is a very common color. White or a large proportion of white is not liked in the U. S. Their legs are short, the horns fine, the hair soft and thick, and the horns short, curved, and of a waxy texture.

In numbers they far exceed all other breeds of pure-bred cattle in the U. S. The American Short-horn Herd-book (1887) records the pedigree of nearly 130,000 bulls, and a much larger number of cows and heifers. H. W. Wilson.

Shorthouse, JAMES HENRY, novelist; b. in Birmingham, England, in 1834; was educated at Grove High School, Tottenham, and engaged in manufacturing at Birmingham. He is best known from his novel *John Ingelman* (1891), a tale with a strong Anglo-Catholic or Tractarian flavor. Others of his books are *The Little Schoolmaster* (1891-94); *Air Patrol* (1896); *A Trasher of the Pit-lane* (1898); and *Blanche, Lady Palace* (1901). H. A. R.

Shoshonean Indians: a linguistic stock of North American Indians. The term Shoshoni, of which the stock name is an adaptation, is not a Shoshoni word, although recognized in the tribe as applying to themselves. *Shoshon* signifies female dog in the Teton dialect; *shoshole*, robin, and *shoshone*, long-eared (alluding to the rabbit in Yankton. It is not improbable that *shoshone* originated in one of these words, and was of appreciable significance. The habitat of this great stock extended from the head-waters of the Missouri in Central Montana to Southern Texas, and from Western Kansas to Western Central Oregon, and the coast of Northwestern California. See the map accompanying the article *Indians of North America*.

According to some authorities the Shoshonean stock, as here recognized, is but part of a linguistic group embracing the Shoshonean, Pima, and Arizonan or Nahueli tribes; but the relationship of these peoples is not proved. The principal Shoshonean tribes are: Bannock, Comanche, Goshute, Paiute (including the Chemachevi), Paviotse, Shoshoni (including the Tukwarish, Tobikhar, Tumyan, Ute. The estimated population is 20,000.

Owing to the extent of country occupied, and its varied climate and topographic features, the Shoshonean tribes differ widely. The habits of the Shoshoni, Bannock, Ute, and Comanche divisions in the north were essentially those of hunting Indians. The Comanche and Eastern Shoshoni alone can be said to have been "buffalo Indians," although the buffalo was hunted more or less by all the northern Shoshonean tribes. In general character these were fierce and warlike. To the W. of the Rocky Mountains the tribes (Paviotse, Paviotse, Goshute, and western Shoshoni) were of a different character. Rabbits and small game, generally, fish, roots, and seeds formed the chief support of these tribes, among which were included the lowest representatives of the stock. It was principally to these that the name *Shoshone* was apparently applied, although they were by no means so low as many writers have asserted. They made and used bows and arrows, were hunters, lived under a simple social system, and even practiced a rude agriculture.

Bannock.—The native tribal designation of the Bannock is *Pawash*, from which their common name is derived. This tribe was divided into two geographically distinct portions—one claiming the territory between lat. 42° and 43° and from 100° 115' to the main chain of the Rocky Mountains; the other division, or southern Bannock, formerly occupying Southwestern Montana, where they had been driven by the Blackfeet. It is probable that at no very distant time the scattered bands of both divisions were united in one locality—Southeastern Idaho and extreme Western Wyoming, where they were pressed upon by the Shoshoni, and to some extent incorporated with them. The Bannock were a tribe of widely roving habits, which favored their dispersal and separation. In language they differ markedly from the Ute, Comanche, Paviotse, and others. About 1860 the southern Bannock—always the more populous division—numbered about 8,400 in 1,200 lodges. Many of them affiliated with the Shoshoni of Western Wyoming, and as early as 1850 had extensively intermarried with them. In 1860 500 or 600 of this division were placed on the newly established Wind river reservation, Central Wyoming (where they are now officially classed as Shoshoni). In 1874 all the scattered Bannock and Shoshoni of Southeastern Idaho were assigned to Fort Hall reservation, Idaho. The northern or Salween river Bannock, after having been decimated by the stockpots and ravages of the Blackfeet, numbered in 1860 about 550 in 815 lodges. There were 405 Bannock on Fort Hall reservation in 1891, and 75 on Lemhi reservation, Idaho, in 1890.

Comanche.—The popular name of this tribal division originated with the Spanish Mexicans. Their own tribal designation is *Núsha*, i. e. people, Indians. This was formerly one of the most powerful divisions of the Shoshonean family. Evidence, mostly traditional, tends to show that their present habitat was in the Snake river region of the northwest, more recently occupied by the Shoshoni. In the sixteenth and seventeenth centuries they were found under the name *Chumaw* and *Jumano* in Western Texas; in the east of New Mexico, and in northern Chihuahua; in 1724 they were on upper Kansas river, and later appear to have centered to the S. of the Red river, Texas. The later Comanche territory may be given as the extensive plains from the Rocky Mountains eastward into Indian Territory and Texas to about lat. 37°, although they raided the country from Kansas southward as far as Durango, Mexico, a distance of 600 miles. Always a wandering tribe, the early possession of the horse by the Comanche intensified their nomadic propensities and gave full scope to their martial character. The theft of horses and the capture of women and children for adoption or ransom were the chief motives for their raids, particularly into Mexico, until 1783, when their power in that direction was broken. They suffered severe loss in numbers at the hands of the Texans in the Texan-Mexican war. They depended largely upon the buffalo for subsistence, and lived in skin tents or tipis during their peripatetic settlements. They have a tribal chief, and are divided into fourteen bands, each headed by a recognized chief. In 1790 the warriors were estimated in number 5,000, equivalent to a population of about 25,000. The reservation in Oklahoma occupied by the Comanche was set aside for them in 1867, when their population was about 2,500. In 1891 they numbered 1,024.

Goshute.—This name, with the variants Goshoot, Goshute, etc., is contracted from Goship (the name of a former chief) and Ute. The group was a confederacy of five tribes—the Payayute, Pucraiate, Torontogute, Towurute, and

Unkagarits—inhabiting the northwestern part of Utah, west of Utah and Great Salt lakes, and a strip in Eastern Nevada. They were one of the few Shoshonean divisions engaging in agriculture, and were scattered over the country as the springs and watercourses afforded arable land. According to some authorities the Gosiute are a mixture of Shoshoni and Ute. There seems to be no aboriginal name of the confederacy—a fact indicating very recent organization as such. Pop. (1890) 256.

Paiute.—The generally accepted idea is that the term originated from *pah*, water, and Ute, hence "water Ute"; more likely it is derived from *pai*, true, and Ute, thus signifying "true Ute." The name has been applied at various times to most of the Shoshonean tribes of Eastern Utah, Northern Arizona, Southern Idaho, Eastern Oregon, Nevada, and Eastern and Southern California, whereas it properly belongs exclusively to the Corn creek tribe of Southwestern Utah. Paiute, however, is a convenient divisional name for the tribes occupying the southwestern part of Utah, Central Nevada, and Northern Arizona, and including the Chemehuevi of Colorado river. Under it are also included the tribes of Southeastern California from the neighborhood of Owens valley along the eastern slopes of the sierras, and to the S. of Tulare Lake and E. of the Coast Range. The principal Paiute tribes are: Chemehuevi or Tantawats, formerly about the great bend of Colorado river and now attached to the Colorado river agency—population about 200; Kwaiantik-wokets, formerly E. of Colorado river, in Arizona, where they affiliated largely with the Navajo, and numbered 62 in 1874; Shivwits and Uinkarets in Northern Arizona—population 182 and 40, respectively, in 1874. There are 19 insignificant tribes or bands in California, among them the Mono (a term collectively applied), Keats, and Moquats; 17 in Nevada, and 8 in Utah (including the Kaivawits and Unkakaniguts). The Paiute population approximates 2,500, there being in Utah 500, Northern Arizona 500, Southern Nevada 1,000, and Southeastern California 500.

Panamint.—This division is linguistically related more closely to the Shoshoni than to any other of the tribes of the stock, and it is not improbable that they became detached from that body through the intrusion of the Gosiute, and gradually drifted to their later habitat in and around Panamint and Death valleys, between lat. 36° and 37°, Eastern California. A few individuals live in the mining town of Darwin, while about 150 are scattered in the desert country to the E. of Panamint valley.

Paviotso (strong, able).—These Indians form a confederacy of twenty-eight insignificant tribes, chiefly in Western Nevada, but extending into Oregon as far north as Lakes Harney and Malheur, and westward to about Warner Lake near the southern boundary, and Camp Bidwell in Northeastern California. The shores of Honey Lake in Eastern California were also occupied by them. In the east they extended to the Shoshoni territory in lon. 117° 30'. Their lowermost settlements were in Owens valley, Eastern California. Like many other tribes of this region, the Paviotso were early confounded with the Paiute, whom they closely resemble. Their extension north into the Pyramid Lake region of Western Nevada and into Oregon has been comparatively recent, having after a long conflict displaced the Saitika. They probably number about 4,000.

Shoshoni.—This is the most northerly division, and formerly occupied Wyoming, the entire central and southern parts of Idaho, except the area occupied by the Bannock, a small part of Eastern Oregon, Eastern and Central Nevada, and a small strip of Utah W. of Great Salt Lake. The Snake river country in Idaho is perhaps to be considered their chief seat, whence they are also called Snake Indians. In 1803 Lewis and Clark found the northern bands of the Shoshoni on the head-waters of the Missouri in Montana, but they had earlier ranged farther east on the plains, whence they had been driven into the Rocky Mountains by the hostile Atsina and Blackfeet, who early obtained firearms.

The more northerly and eastern Shoshoni were horse and buffalo Indians, and in character and warlike prowess compared favorably with most western tribes. Those of Snake river and to the south in Nevada represented a lower type, since most of this country was barren and comparatively devoid of large game. They depended for food to a large extent upon fish, supplemented by rabbits, roots, nuts, and seeds. The Shoshoni, more commonly than any others of the Shoshonean tribes, were called Diggers and Shoshokos (walkers). None of them were agriculturists. In general, the style of their habitations corresponded to the two types

of Shoshoni. In the north and east they lived in pole and skin lodges, but in the sage country to the west brush shelters were used, some of them in the Snake river region being mere roofless semicircles that afforded little protection against the wind and snow. There were many dialects corresponding to the degree of isolation of the several tribes, but mutually intelligible. The most important of the original divisions or bands of the Shoshoni are the Tukuarika or Sheep-eaters, Tussawehe, and Wihinash. They have materially decreased in numbers; those surviving are in Nevada; on Fort Hall and Lemhi reservations, Idaho (pop. 948 and 357 respectively); western Shoshoni reservation, Nevada (pop. 367), and the Shoshoni reservation, Wyoming (pop. 883). Their entire number approximates 5,000.

Tobikhar.—This term, meaning settlers, belongs strictly to a group of small tribes formerly about San Gabriel mission and Los Angeles, Southern California, but has been adopted as a group name to include the Shoshonean tribes who spoke related dialects, and lived about the missions of San Luis Rey, San Juan Capistrano, San Fernando, Los Angeles, San Bernardino, and San Gabriel. These formed the southwestern or coast division of the stock, and their remnants compose the bulk of the so-called Mission Indians, which embrace also a few representatives of the Yuman stock. The status of the Indians of this group and their relation to the State government have never been fully defined. They appear not to have been agriculturists prior to the mission period; hence upon the disestablishment of the missions some of the Indians returned to their primitive mode of life, while others practiced the rude arts of agriculture learned under mission sway. Notwithstanding their docile and submissive character the Tobikhar, like most of the Shoshonean tribes, were doubtless once of a more aggressive and warlike disposition, and were able to force their way to the coast through the Chumashan and Mariposan tribes on the north, and those of Yuman stock on the south. The population is about 2,200.

Tusayan (probably from the Navajo *Zilh-Tásdun*, signifying country of the isolated buttes).—The so-called province of Tusayan comprises seven pueblos on the summits of four mesas in Northeastern Arizona, about 50 miles E. of the Rio Colorado Chiquito, and about the same distance S. of the Rio San Juan. The pueblos constitute three groups: Walpi, Sichumovi, and Hano or Tewa in one; Mashongnovi, Shumopovi, and Shupaulovi the second, 7 miles westward; Oraibi the third, 8 miles still farther west. Six of these villages are inhabited by the Hopi (signifying "people," but improperly called by the opprobrious Zufi term *Moki*), the seventh pueblo, Hano, being occupied by a division of the Tewa tribe, of Tanoan stock, who left their kindred on the Rio Grande about 1680, and settled at Tusayan, where they maintain their distinctness. The Hopi afford the only instance of tribes of the predatory Shoshonean stock who have adopted a strictly pueblo life. Tusayan was known to the earliest Spanish explorers of the Southwest. Marcos of Niza in 1539 spoke of it under the name Totontec. It was first visited by whites in 1540, when Tobar and Padilla, and afterward Cardenas, of Coronado's army reached the so-called province from Zufi. Expeditions to Tusayan were also made by Espejo in 1583 and Oñate in 1598. Missions were established at the now ruined pueblos of Awatobi and at Mashongnovi and Shumopovi at an early date, but were abandoned upon the murder of the missionaries and destruction of the churches during the Pueblo revolt of 1680. Tusayan tradition seems to indicate that the present Hopi villages are a confederacy of phratries, or perhaps independent groups, who, after various wanderings, settled in one place. The union is not a close one, and tradition points to feuds and even to bitter wars between the towns, during one of which Awatobi (once the principal pueblo) was totally destroyed. Like the other Pueblo tribes, the Hopi have been agriculturists since first known to history. They early acquired possession of sheep, and are expert weavers, potters, and basket-makers. The estimates of population given by the early explorers are greatly exaggerated. They number about 1,750.

Ute.—This division formerly occupied the central and western portions of Colorado and Southeastern Utah, including the eastern part of Salt Lake valley and Utah valley. They extended also into New Mexico, occupying much of the drainage area of the Rio San Juan. None of the Ute were agriculturists, but they appear to have been always a warlike people, and their early possession of horses intensified their aggressive character. The various divisions or

geographic basis, were probably originally united in a loose confederacy, and while dialectal differences exist in the language, intercourse was carried on with little difficulty. The Ute Indians in the northernmost part of the range have intercourse more or less extensively with the Navaho, Shoshoni and Paiute, and in the south with the Shaville Apaches. The first Ute treaty was proclaimed Sept. 9, 1867. In 1864 a treaty was made with the Tabagumaho band and a reservation set apart for it and the Muncie band in Southwestern Colorado. In 1888 a third treaty provided for all the different bands, while the final treaty, by which the Utes are confined within the present reservation limits, was made in 1873. The restless character and unfriendly spirit of these Indians have rendered even an approximately correct census impossible. The official figures of the reservation for 1901 are: Southern Ute agency, Colorado, 985; Arapaho reserve, Utah, 1,929; Uintah reserve, Utah, 840—total, 2,854. There are probably twice as many more not confined to reservations. See INDIANS OF NORTH AMERICA.

SHREWSBURY.—Davies, *Bibliography and Philology of Missouri Valley* (Philadelphia, 1862); Powell, *Ancient Peoples of the Missouri (Northern's Magazine, New York, Dec., 1876)*, and *Indian Linguistic Families* (Seventh Annual Report of the Bureau of Ethnology, Washington, 1891); Stephen Powers, *Indians of California* (Cal. N. A. Eth., 18, Washington, 1877); Wheeler Survey Report (vol. vii, Archaeology, Washington, 1879); J. G. Bourke, *Snake Dance of the Moquis of Arizona* (New York, 1884); O. H. Bancroft, *Native Races* (vols. i-iv, San Francisco, 1882), and *History of Utah* (San Francisco, 1889); H. W. Henshaw, *Shoshone and Muncie Indians of California* (Popular Science Monthly, New York, Oct., 1890); V. Mindeff, *Shoshone and Ute* (Eighth Annual Report of the Bureau of Ethnology, Washington, 1891); P. Y. Coville, *Permanent Indians of California* (The American Anthropologist, Washington, Oct., 1902); and the various writings of J. Walter Powell on the Shoshone. J. W. POWELL.

Shoshone (shóshó-né) Falls: a cataract in Idaho, formed by Snake river plunging over a cliff of trachyte 180 feet high. Half a mile above the falls the river is 1,200 feet broad, and flows in a canon 800 feet deep. At the falls the stream narrows to 1,000 feet, and descends into a gorge 1,000 feet deep. The falls are due to the fact that the river in descending its channel in horizontal sheets of basalt has reached a ridge of more resistant rock beneath. L. U. R.

Shot: projectiles for firearms. For those used in cannon, see PROJECTILES. The smaller kinds, ranging in size from buck-and-a-half-shot, are composed of an alloy of lead with about 1 per cent. of arsenic, the addition of which gives greater softness and ductility. They are made in shot-towers by passing the molten metal through orificers perforated with holes from 1/16 to 1/8 inch in diameter, and letting the particles fall from 100 to 150 feet into water. Another method lessens the height through which the particles must fall in order to assume the spherical shape and harden, by using a tube through which a strong upward current of air is forced. The shot are afterward assorted, rolled down an inclined plane so arranged that the misshapen shot fall out, and finally polished by being piled in a rotating cylinder with some powdered graphite.

Shoveler, or Spoonbill-duck: a river duck of the genus *Anas*, so named on account of the form of the bill, which is much widened toward the tip. The common shoveler (*Anas platyrhynchos*) of the northern hemisphere has the head and neck green, the breast white, belly chestnut, wing-coverts blue, speculum green (bordered by black and white), rump and tail-coverts black. The female is brownish, with blue wing-coverts. *A. platyrhynchos* from South America, *A. cinnerea* from South Africa, *A. chrysolotis* from Australia, and *A. marginata* from New Zealand are the other species.

Shrapnel. See PROJECTILES.

Shreve, Henry Miller: inventor; b. in Hurlingham, N. J. Oct. 21, 1795; was reared in Western Pennsylvania, and became interested in the navigation of the Western rivers. In 1810 he took a cargo of lead from Galena river to New Orleans, and opened a business which had been previously monopolized by the British. In 1814 he took command of a steamboat, and a few days before the battle of New Orleans carried supplies to Fort St. Philip, passing the British batteries, his vessel being protected from their fire by cotton-bales. In May, 1815, he ascended the Mississippi to Louisville in the Enterprise, the first steam-vessel that

had ever performed that voyage, and subsequently built the Washington, of 481 tons burden, with improvements upon Robert Fulton's steamboat, especially in the saving of fuel. On Mar. 9, 1817, the Washington made her first trip. The return trip from New Orleans was made in twenty-five days. The enterprise of Capt. Shreve soon excited the hostility of Fulton and his associates, who had obtained the exclusive rights to "navigate all vessels propelled by fire and steam" in the rivers of the Territory of Orleans. The boats were seized in New Orleans and he was arrested. A protracted lawsuit followed, which was finally decided in his favor. He finished the George Washington in 1824 upon a new model, which continued in use for over fifty years, having side-wheels each worked by a separate engine. In 1829 he completed his snag-boat, the Heliopolis, for removing snags and sawyers from rivers, and with it removed the great Red river raft, a collection of timber and driftwood 16 miles in length. In 1829 Capt. Shreve invented a steam marine battering-ram for harbor defense. He was made superintendent of Western river improvements in 1830, and continued in that position until 1841. D. in St. Louis, Mar. 6, 1854.

Shreve, Simon Henry, A. M., J. D., B.: civil engineer; b. in Trenton, N. J., Aug. 2, 1829; graduated at Princeton 1848, at Harvard Law School 1850; studied civil engineering; was chief engineer of several railroads; published in 1873 a treatise on the *Strength of Bridges and Roofs*, and became in 1875 engineer of the New York Rapid Transit Commission. He was consulting engineer of the Metropolitan Elevated Railroad and engineer-in-chief of the Brooklyn Elevated Railroad. D. in New York, Nov. 27, 1904.

Shreveport: city (incorporated in 1830); capital of Caddo parish, La.; on the Red river, and the Houston and Shreve, the Queen and Cress, Route, the St. Louis S. W., and the Tex. and Pac. railways; 41 miles S. of Louisville, Ky., and 330 miles N. W. of New Orleans (for location, see map of Louisiana, ref. 6-B). It is the second city in population in the State, is in a cotton-growing region, has an extensive river trade, and handles large quantities of cotton, hides, wool, and wax. The city is provided with improved water-works, gas and electric-light plants, sewers, and street-railways, and contains a U. S. Government building, parish court-house, a public hospital, the headquarters of the State board of health, several cotton-compresses, cottonseed-mill, ice-factories, and machine-shops. There are 10 public-school buildings, public-school property valued at \$20,000, 2 national banks with combined capital of \$300,000, an incorporated bank with capital of \$150,000, a private bank, and 3 daily and 2 weekly newspapers. In 1892 the city had a total assessed valuation of \$3,250,000, and in Feb., 1894, the total debt was \$156,500. Pop. (1880) 8,000; (1890) 11,979; (1895) estimated, 14,000.

Shrew, or Shrew-mouse: a small, insectivorous, mouse-like mammal of the family Soricidae (q. v.). Shrews are found in nearly all parts of the northern hemisphere; they are

Shrew.

nocturnal, frequently aquatic, produce their young blind and naked, do not hibernate, and have an elongated and pointed muzzle, small eyes, plantigrade, five-toed feet, and glands which secrete a musky fluid.

Shrewsbury (anc. Pengwern): capital of Shropshire, England; on the Severn, which is crossed here by three bridges; 42 miles W. by N. of Birmingham and 163 N. W. of London (see map of England, ref. 6-G). It is an old picturesque town, though the streets are steep and narrow. The Norman castle still remains, and of the same date is the Church of the Holy Cross. St. Mary's church, a quadrangular building with a tower and spire, was founded in the tenth century. Among other buildings are the market-house (1575), the shire-hall, rebuilt in 1883, and the new market-hall (1868). Shrewsbury School, founded in 1531, is one of the seven great public schools of England, and has a rich endowment. Near here on July 21, 1403, Henry IV.

defeated Hotspur, and in 1644 the town was besieged by the parliamentary army. Shrewsbury sends one member to Parliament. Pop. (1891) 26,967.

Shrike [O. Eng. *scric*, thrush, (perhaps also) shrike: Icel. *shrikja*, shrike, liter., shrieker; cf. Eng. *shriek*]: any one of the *Laniidae*, a family of passerine birds. The best known North American species is the butcher-bird (*Lanius borealis*). They are noted for their habit of impaling insects and small birds upon the points of thorns.

Shrimp [cf. *shrimp*, another form of *scrimp*]: a name properly restricted to crustaceans of the genus *Crangon*, but

The shrimp.

more usually applied to any of the smaller long-tailed crustaceans. The common shrimp of Great Britain, *C. vulgaris*, is esteemed a delicacy as food.

Shropshire, or **Salop**: a west midland county of England; on both sides of the Severn, and bounded W. by Wales. Area, 1,319 sq. miles. The northern part is level, with the exception of the Wrekin (1,320 feet), and is chiefly under tillage; the southern is hilly, reaching 1,800 feet in the Clee Hills, and mainly devoted to cattle-breeding. The county has a fine breed of sheep. There is a considerable production of coal and some of iron, limestone, and freestone. Pop. (1891) 236,324.

Shrove-Tuesday [from *shrive*, to confess sin]: the day preceding Ash-Wednesday, so called from the old custom of confessing and receiving shrift on that day as a preparation for the forty days' fast. It is in general a day of pleasure in most Roman Catholic countries. It is the Carnival of the Italians, the Mardi Gras of the French, and the Pancake-Tuesday of former days in England.

Shu'brick, WILLIAM BRANFORD: rear-admiral U. S. navy; b. on Bull's island, South Carolina, Oct. 31, 1790; entered Harvard in 1805, but was appointed midshipman June, 1806. He became lieutenant Jan., 1813; commanded a gunboat in Hampton roads in 1813, and assisted in the defense of Norfolk and the navy-yard at Gosport; in 1813 was transferred to the Constitution, and made two cruises, aiding in the capture of three ships of war, including the Cyane and the Levant; was awarded a sword by his native State and a medal by Congress; was promoted to the rank of commander 1820, and served at the navy-yards at Charlestown, Mass., and New York until Apr., 1826, when he was appointed to the command of the Lexington; in 1831 was commissioned captain; commanded the West India squadron 1838-40; was in command of the navy-yard at Norfolk, Va., Oct., 1840-Oct., 1843; chief of the bureau of provisions and clothing for the navy 1845-46; was appointed to command the Pacific squadron July, 1846, and during the war with Mexico captured several ports; was appointed to the lighthouse board Sept., 1852; placed in command of the eastern coast squadron for the protection of American fishermen July, 1853, and in September returned to Washington and resumed his duties as chairman of the lighthouse board; appointed president of board to prepare regulations for the navy Aug., 1857; commanded the Brazil squadron and Paraguay expedition 1858-59, returning to resume duty as chairman of the lighthouse board; was retired in 1861, but continued a member of the advisory board until 1870; was commissioned rear-admiral in 1862. D. in Washington, D. C., May 27, 1874.

Shu'feldt, ROBERT W.: rear-admiral U. S. navy; b. in Red Hook, N. Y., Feb. 21, 1822; entered the navy as a midshipman May 11, 1839; commanded several vessels on the coast during the civil war, and was actively engaged against the defenses of Charleston; commanded the flag-ship of the East Indian squadron during 1865 and 1866, and that of the Mediterranean from 1871 to 1873; in 1875 appointed chief

of the bureau of equipment and recruiting. He was consul-general to Cuba during the first year of the civil war—a place of great importance, which he filled with admirable judgment and discretion. Retired Feb. 21, 1884.

Shullsburg: city; Lafayette co., Wis.; on the Ch. Mil. and St. P. Railway; 24 miles E. by N. of Dubuque, 60 miles S. W. of Madison (for location, see map of Wisconsin, ref. 7-C). It is in an agricultural and lead-mining region, and contains 4 churches, 3 hotels, a national bank with capital of \$50,000, a State bank with capital of \$50,000, and two weekly newspapers. Pop. (1880) 1,168; (1890) 1,393; (1895) estimated, 1,400.

EDITOR OF "PICK AND GAD."

Shu'magin Islands: small archipelago of Alaska, in lat. 55° N., lon. 160° W., just E. of the peninsula of Alaska, from which they are separated by Unga Straits, consisting of Unga, Nagai, Popoff, Korovin, Big Koniushii, Little Koniushii, Simeonoff, and many smaller islands and islets. Unga is about 10 miles long by 7 broad, and contains the only settlement of any size on the islands, viz., the little town of Unga near the southeast angle. Nagai is about 30 miles long by 4 broad, and of very irregular shape. The islands are generally mountainous, are without tree-growth, have abundant rainfall, and several excellent harbors. Good lignite has been found on Unga. Salmon abound in the streams in early summer, and good cod-banks are near by. These islands were discovered by Lieut. Waxel in 1741, and were given the name of one of his sailors buried there. Area about 600 sq. miles.

MARK W. HARRINGTON.

Shumla: town; in Bulgaria, half way between Rustek and Varna; in a fertile plain, inclosed on three sides by inaccessible spurs of the Balkans and strongly fortified (see map of Turkey, ref. 3-D). It is also an important commercial center and manufactures leather, copper ware, and cloth. Pop. (1893) 23,517.

E. A. G.

Shur [Heb., wall]: the name applied by the Hebrews to the desert which bordered Egypt on the E. of the southern half of the Isthmus of Suez (Ex. xv. 22). Some have derived the name from the wall, 1,500 stadia long, which is alleged by Diodorus (i., 57) to have been built by Sesostris from Pelusium to Heliopolis for the defense of Egypt against the eastern Bedouin. (Trumbull, *Kadesh Barnea*, pp. 44 ff.) An *anbu haq* (wall of the ruler) in this region certainly is mentioned in a papyrus of the twelfth dynasty, but it antedated Sesostris-Rameses by more than the whole Hyksos period. In most of the Old Testament passages *Shur* seems to have been the name of a place near Egypt (Gen. xvi. 7, xx. 1, xxv. 18; 1 Sam. xv. 7, xxvii. 8), and it has been conjectured that it corresponded with the Egyptian *Anbu* (wall, Gr. *Gerrhon*), which probably lay near the Mediterranean to the N. of the isthmus, and was a fortified place on one of the highways to the East (Strabo, *Geogr.*, xvi., 2, 23).

CHARLES R. GILLET.

Shurtleff, NATHANIEL BRADSTREET, M. D.: antiquary; b. in Boston, Mass., June 29, 1810; graduated at Harvard 1831, and at the Medical School 1834; became a physician in Boston; mayor of Boston 1868-70. He was the author of *An Epitome of Phrenology* (1835); *A Perpetual Calendar for Old and New Style* (1848); *Passengers of the Mayflower in 1620* (1849); *Notice of William Shurtleff of Marshfield* (1850); *Genealogy of the Leverett Family* (1850); and *A Topographical Description of Boston* (1871), besides many minor publications and contributions to *The Genealogical Register*. He was the editor of the series of *Records of the Governor and Company of Massachusetts Bay 1628-86* (6 vols. 4to, 1853-54), and, with David Pulsifer, of the equally important *Records of the Colony of New Plymouth* (12 vols. in 11, 4to, 1855-61). D. in Boston, Oct. 17, 1874.

Shusha: town of Elisabethpol, Asiatic Caucasus, Russia; lat. 39° 46' N., lon. 46° 25' E.; formerly a fortress, on an isolated rocky hill, inaccessible on three sides; celebrated for its silk-culture, carpets, and horses; 70 miles S. by E. of the city of Elisabethpol (see map of Russia, ref. 12-G). The climate is rigorous. This place was formerly capital of the khanate of Karabagh, annexed by Russia in 1822. Pop. (1891) 26,806.

M. W. H.

Shuvaloff: another form of the name SCHUVALOV (q. v.).

Sialagogues [Gr. *σάλαιον*, saliva + *ἀγωγός*, leading, deriv. of *ἀγειν*, lead]: drugs that cause an increased secretion of saliva. Mercury has this property more than any other substance, but as the increased salivary flow is simply one among many effects of a poisonous dose of the drug, the term sialagogue is not a proper definitive appellation.

Stakkot', or Sealkote, ancient city of the Panjab, British India, 33 miles N. of Amritsar, lat. 32° 01' N., lon. 74° 30' E.; not far E. of the Chinab, a station on the branch railway from Rangoon to Jambh, capital and commercial center of the district of Stakkot (see map of N. India, 107, 110). It is a well-built and beautiful city, with well-paved principal streets and squares. In the center are the ruins of a very old fort used during the revolt of 1857-59. It is a sacred place for the Sikhs, and contains the mausoleum of Baba Nanak, their first apostle or guru. The old highway connecting from Lahore, Amritsar, Multan, and Delhi passes at the bridge near this place over the Akh tributary to the Chinab, but are usually lost in the sand before reaching this station. It is a center for great numbers and merchants, who are mostly Sikhs. Cotton and paper are manufactured, but the industry is declining. The foundation of the city is attributed to houses of the Mahadharis. Pop. (1881) 32,087, two-thirds Mohammedans. M. W. A.

Siam, *si-am*, or *si-iam* (from Malay *Siam*, the brown name; *Siamu* *Huang* *Tha*, *liang*, kingdom of the free) kingdom of Central Indo-China, consisting of a central kingdom by the Menam valley and several tributary states around it and on the Malay Peninsula (see map East Indies, 107, 111, 112). The E. it was long limited by the Anson watershed, but in 1893 France took possession of the whole territory E. of the Mekong. On the N. E. it is bounded by Cambodia, on the N. and W. the boundaries are ill-defined and subject to negotiation with the British and French, but Siam claims the territory N. to beyond the parallel of 20° N. and westward to the Salween river in latitudes 18° to 20° N. Further S. the boundary is more to the westward and is irregular. On the Malay Peninsula the Siamese influence is exerted on the coast coast from the head of the Gulf of Siam to Peking, lat. 4° 30' N. and over the whole peninsula from the latitudes of 6° to the British province of Wellesley in lat. 6° 05' N. The total area is about 990,000 sq. miles.

Geography.—Siam is bounded N. and W. by mountain ranges having a general N. and S. direction, and consists of three distinct areas. The first is the Menam basin, practically a plain rising to the northward, at first slowly, then rapidly, and occupied by the kingdom proper and some of the tributary states to the N. It is about 400 miles long by 150 broad, and ascends only 300 feet in the first 200 miles, but 900 to 1,000 feet in the next 150. The northern end, in which lie the sources of the Menam, is mountainous. The second is the Mekong or Lao plateau, to the E. of the preceding, about 300 miles N. and S. by 200 E. and W., separated from the preceding by hills and low mountains, and drained by the left-hand affluents of the Mekong, S. of its great bend to the westward. It is somewhat more elevated than the Menam basin adjacent. The last is the Malay Peninsula, consisting of a central ridge of mountains flanked by extensive plains. The kingdom is well watered. The Menam has as level a course that it divides several times into two or more streams which unite farther down after including islands of large size. This delta-like characteristic extends to about 250 miles from the mouth. The stream is well suited to navigation by native craft and by sails. The climate is tropical, but moderate and generally healthy. There are three seasons in the year, each of four months duration. The hot season begins in January and the temperature rises until the rains begin in early May. The mean temperature in April in Lower Siam is about 85°. The rains come with the S. W. monsoons, but are less heavy than on the Burmese coast. The rainfall is heaviest on the west coast of the Malay Peninsula (100 inches) and decreases westerwardly to 40 inches. The cool season begins in September and brings pleasant temperatures, clear skies, and serene weather. The thermometer at Bangkok may descend in this season to 55°, or even lower. This is the season for *pu*—harvest, to which the Siamese are much devoted.

Mineral Products.—Siam is rich in minerals, especially in the peninsula and along the western mountains. Gold, tin, iron, copper, argentiferous galena, and antimony have been found, but only the first two are mined. Precious stones are found in considerable quantities in the southeast. The production of rubies is important; that of sapphires, emeralds, lapis, and jade less so. Rich mines of sapphires were opened near Chaiburi in 1874, but were soon abandoned because of the instability of the climate. Coal has been found in the peninsula; petroleum springs occur in the Siam coast to the N., and rock-salt in several places. *Cassia* stem essence oil is produced along the coast of the gulf.

Vegetation and Agricultural Products.—The forests of Siam have been much encroached on where they lie along settling streams, but elsewhere they continue in unbroken luxuriance, and contain many valuable woods of oak and ebony. At the highest elevations in the north the forests become like those of the temperate zone, resembling those of Central Japan and containing oaks and pines. The soil is alluvial and very fertile, and numerous crops are produced with little labor. The chief agricultural product, and the staple article of diet, is rice, of which the Siamese have about fifty varieties. In 1893 it is estimated that the rice product was about 800,000 tons. Other crops are pepper, coconuts, hemp, sugar, opium, tobacco, cotton, coffee, and maize, most of them only in quantities sufficient for local consumption.

Fauna.—The fauna is very rich and varied. This is the traditional land of the elephant, though the natives are not so skillful in taming and breaking them in as the natives of Hindustan. The tributary state of Chienmai is estimated to have 8,000 domesticated elephants that of Lakhon 10,000, and they are not less numerous elsewhere. The price of an elephant is from \$750 to \$1,000. Small white elephants are considered sacred and are tenderly cared for. These are albino, and the rest is not so much the color of the skin as of the eyes and the hair on the temples. Albino monkeys are also sacred. The simians are very numerous, and their most important representatives are the gibbons, anthropoid apes, of which there are several species. Bats are abundant, and in mountain caves form large colonies of guano. Birds' nests are collected in such quantities that the tax on them produces \$125,000 annually. Among the numerous and varied domestic animals, besides the elephant, may be mentioned the ox, several kinds of horse, a peculiar race of hog, the sheep, the goat, and several kinds of domestic fowls. The horned cattle form the most important source of wealth. About 70,000 are annually exported to Singapore, the Siam states, and Burma. Fishing is an important industry, and considerable quantities of dried fish are exported.

Inhabitants.—The population is estimated at 5,000,000, of whom about two-fifths are Siamese proper and the remainder about equally divided between other Siamese, the Chinese, and the Malays. The Chinese are generally from Kwangtung and there are many Sino-Siamese half-breeds. They are for the most part in the kingdom proper, where they have largely appropriated trade and commerce to themselves, and form the chief source of free labor. They are of independent spirit, and their turbulent character causes the Government much trouble. The other people of the same ethnic race as the Siamese are the Shan proper in the north and the Lao in the northeast and east. They occupy the tributary states, and the Siamese influence has been extended over them by conquest. The Malays are found chiefly in the tributary states of the peninsula.

The Siamese proper are found chiefly up the Menam valley to the vicinity of Phumuck (about lat. 15° N.) and around the head of the gulf. Though for many centuries warlike, they appear indolent, gentle, and patient. They are small but well formed, with an olive or yellowish complexion and jet-black hair, hospitable, humane, not inventive, untruthful, and capricious. In customs, manners, and civil institutions they are curiously intermediate between India and China, and thus especially deserve the name of Indo-Chinese. The religion is Buddhist. Indeed Siam assumes in an especial way the character of protector of Buddhism, and this has made the relations between Siam and Ceylon especially close.

Language and Literature.—The language is of the Shan stock, monosyllabic in character, very different from Annamese and Burmese, and written with a script borrowed from the Pali. The literature is abundant and varied, consisting of religious, legal, and scientific books and a considerable body of *belles-lettres*. The religious works are largely derived from Buddhist sources; the others are chiefly of indigenous origin. The chief science is astronomy, and they have their own system of chronology. The romances and stories are said to be Indian and lacking in refinement. There is relatively little industry because of a system of forced labor under which each man, except a few privileged classes, owes the Government three months' labor each year. Domestic slavery is little practiced, and is in process of abolition. Free labor is difficult to obtain. Foreign labor is making considerable progress. Education is generally in the hands of the priests and is much hampered by tradition. Three large public schools have been established in Bangkok, where

European arts, sciences, and languages are taught, and for many years it has been the custom to send a few young Siamese abroad for a technical education.

Government.—The throne is hereditary, but the king may choose his successor in his own family. The legislative power is in the hands of the king, assisted by a council of ministers. The tributary states are ruled sometimes by their own princes, sometimes by a royal commissioner, and there is a strong tendency toward increased centralization. The kingdom proper is divided into forty-one districts under royal governors. The king's annual revenue is estimated at \$10,000,000, produced by a land-tax, customs, taxes on opium, spirits, tin mines, fruit-trees, edible birds'-nests, fisheries (in the order of the amount of revenue from each), and other sources. All taxes, except customs, are farmed. There is no public debt. The standing army consists of 12,000 men, well supplied with arms and artillery, is largely officered by Europeans, and is said to be in a very effective condition. All males of suitable years are subject to military duty. The Government has a small navy, and the mouth of the Menam is fortified at Paknam.

Commerce.—Bangkok, the capital, is also the commercial center and chief port. In 1893 the imports were valued at \$11,295,390 and the exports at \$22,285,570. About one-fourth of the imports in value was cotton goods, and of the exports five-sevenths consisted of rice. Other exports were teak, pepper, salt and dried fish, and bullocks and hides. Both imports and exports are chiefly exchanged with Hongkong and Singapore, and there is a considerable trade to the northward to the Shan states and Yunnan. In 1892 292 vessels (248 of them British) entered Bangkok, and 288 vessels (242 British) cleared from that port. A railway, 14 miles long, connecting Paknam, at the mouth of the river, with Bangkok was opened in 1893. A railway from Bangkok to Korat, 165 miles N. E., is under construction, and many others have been projected. Bangkok has an electric tramway in operation. Telegraph lines, with a total length of 1,780 miles, connect Bangkok with Chiangmai, Chantabun, and other Siamese cities; also with Saigon in Tonquin and Maulmein in Burma. There is a postal service with 98 stations outside of Bangkok (1890), and Siam belongs to the International Postal Union. In 1890 189,970 domestic and 219,170 foreign letters were handled. The unit of money is the *tical*, a silver coin worth forty-one cents in average exchange. Silver and bronze are coined in fractions of the *tical*, and paper money is current in multiples of this coin. The unit of weight is the *chang* (2½ lb., avoirdupois); and of length, the *niu* (1½ English inches) or the *wah* (48 niu = 80 inches).

History.—The Siamese apparently came from the north and first appear in history in 575 A. D., when they founded Labong, about lat. 18° N., in the Upper Menam valley. The date of introduction of Buddhism among them is put at 638 A. D. They pressed steadily southward as invaders until in the thirteenth century they had reached the gulf and peninsula, and had apparently more territory than they have now. In 1350 they made Ayuthia the capital, and it so continued until 1782, when the Government removed to Bangkok, where it remains. For many centuries they carried on wars with their neighbors, the Burmese, Peguans, Cambodians, and with the people they displaced, with varying fortune but final success. The Burmese twice took their capital (1555 and 1767), the second time only after a two years' siege. In 1592 Siam entered into close diplomatic and commercial relations with Japan, and many Japanese settled in the country, where they played the part now taken there by Europeans, but native jealousy finally resulted in their expulsion with violence in 1632. Very similar is the history of their relations with France, begun in 1684. The present dynasty succeeded a Chinese one, and began with the removal of the capital to Bangkok (1782). The conquests of Shans and Laos have been chiefly under this dynasty. The last three kings have made especial effort to extend the relations of Siam with the Western world. Maha Mongkut (1852 to 1868), the immediate predecessor of the present king, was a man of great learning and enterprise, and the present king, Chulalongkorn, continues his broad-minded policy. Siam is, however, weak, and, wedged in as she is between British and French possessions, owes her continued existence to suzerainty on their part. In 1893 France possessed herself of Siam's territories across the Mekong, and in 1895 negotiations were in progress between France and Great Britain to form a buffer state between Siam and China, Tonquin and Burma.

REFERENCES.—The classical work on Siam is that of Mgr. Pallegoix, *Description du royaume Thaï ou Siam* (2 vols., 1854). Siamese Twins: See ENG AND CHANG.

Siberia [from Russ. *Sibir*, Siberia, a word perhaps of Tartar origin from *Saibir*, the name of the seat of the Tartar rulers on the Irtysh]: a territory in Northern Asia, belonging to Russia. It is bounded on the N. by the Arctic Ocean from the mouth of the Kara river on the W. to Bering Straits; on the E. by Bering Sea, the Sea of Okhotsk, the Tartar Channel, and the Sea of Japan S. to the mouth of the Tumen-kiang on the Korean frontier; on the S. by Korea, Manchuria, Mongolia, and the Russian provinces Semipalatinsk, Akmolinsk, and Turgai of the steppes; on the W. by the upper Ural river, the Ural Mountains, and the Kara river. It includes portions of the governments of Orenberg and Perm usually classed as European. Thus limited Siberia has an area of 4,925,000 sq. miles, and a population of about 6,000,000. It is about a quarter larger than all Europe, but has only the population of Belgium.

Political Divisions.—Politically, Siberia includes Saghalien with the above, but excludes Orenburg and Perm, giving an area of 4,833,496 sq. miles, and a population, according to official estimates from 1889 to 1892, generally for 1890, of 4,538,561, or a little less than one per square mile. In this territory are the governments of Tobolsk and Tomsk, formerly composing the government of Western Siberia, but now directly administered under the Russian Minister of the Interior; the governments of Yeniseisk and Irkutsk, and the province of Yakutsk, formerly composing the general government of Eastern Siberia, now called the general government of Irkutsk; the provinces of Transbaikalia, and of the Amur, the Coast Province or Primorskaia Oblast, and the circle of Saghalien, forming the general government of the Amur. For details as to these governments and provinces, see each under its own heading.

Configuration.—The Ural Mountains, which separate Siberia from European Russia, reach an elevation of only 5,522 feet at their culminating point at Mt. Konchakof in the government of Perm. They can be traversed without difficulty, and their slopes are especially gentle on the Asiatic side. These mountains aside, Siberia has a very simple structure, consisting of an elevated plateau in the southeast, set in mountains, and passing toward the W. and N. by an enormous plain. The plateau is called the plateau of Vitim, from the branch of the Lena which takes its rise there. It is the northward extension of the great plateau of Asia, which has its highest and broadest part abutting the Himalaya Mountains and extends nearly to Bering Straits. In Siberia it is narrow and relatively low, rarely surpassing 3,000 feet. In this plateau all the great rivers of Siberia take their rise. The margins consist of a series of mountain ranges with relatively gentle slope where they abut on it, and abrupt descents toward the plain or sea. On the sea of Okhotsk the mountains rise abruptly from the water, and there is an outlying range in Kamchatka. In the Amur region plains of considerable magnitude intervene between the ranges at the eastern margin of the plateau and the coast ranges, which extend from Korea to the mouth of the Amur. The termination of the plateau toward the N. E. is in a region very imperfectly explored. The area so far described includes only about one-fourth of Siberia. The remainder consists of an enormous plain extending W., N. W., and N., and sloping N. and W., with an ill-defined intermediate hilly region. This is the great plain of Asia, and is continued beyond the Urals in the plain of Russia and Germany. In Asia it consists southwestward of steppes, grassy and sandy, which rise very gradually to the low, rounded, imperceptible watershed between the Arctic and Turkestan systems of drainage. Its slope northward is rapid near the mountains, thence growing more and more gradual. The steppes pass gradually into the tundras of the north, which extend to the Arctic Ocean along the entire northern boundary. They are level or rolling plains, subarctic and arctic in character, with an alluvial soil. They are of a depressing sameness, are well-watered, and would be suitable for cultivation did the climate permit. Their

along northward is extremely gentle, and is continued under the Arctic Ocean as far as soundings have been made. At 200 miles from the coast soundings have given depths of 13 or 14 fathoms only.

The coast of Siberia measures 19,000 miles, of which 10,000 belong to the Arctic Ocean. The northernmost point of the mainland is Cape Chukotsk in lat. 77° 06' N., about 8° farther N. than Point Barrow, the northernmost point of the U. S., and 9° farther N. than North Cape of Norway. On the north coast are the great indentations called the Gulf of Ob, the two great peninsulas of Yana and Taimyr, and to the N. of Yakutsk the large archipelago of the New Siberian islands, the northernmost known point of which is on Borzoi Island in about the same latitude as Cape Chukotsk. Nordenskiöld first traversed this coast in 1878-79, to his celebrated voyage in the Vega. The rigor of the climate of these high northern latitudes prevents profitable commerce, notwithstanding the ready access given to the interior in summer by the great Siberian rivers. The shores of floating ice are provided with harbors, and are accessible for a longer season each year, but the country inland is barren and relatively inaccessible. Along the Sea of Japan the coast is bold and rocky, furnishing generally little protection for commerce. The exceptions are the bays of St. Vladimir (lat. 41° 55' N.), of St. Olga (lat. 41° 44' N.), which afford good anchorages, and the Gulf of Peter the Great near the Korean border, where the Russian naval station and town of Vladivostok is situated. It has several smaller bays, and the town is on a peninsula between the Bay of Amur and the Bay of Ussuri. At the Korean border is the Bay of Posset, with the Pallas anchorage and two interior bays. The entire Siberian coast is rising slowly, and marine shells are found far inland from the Arctic shore.

Hydrography.—Siberia is provided with a magnificent system of rivers. Belonging entirely or in part to it are 38 streams 400 miles or more long, when the minor meanders are neglected, 27 more than 600 miles long, and 8 which are 1,000 or more miles long. The four largest are the Ob (2,900 miles), the Lena (2,800 miles), the Amur (2,800 miles), and the Yenisei (2,500 miles). All rise about the plateau already described—if of sufficient length—and all, except the Amur and Anadyr, contribute to the Arctic Ocean. The long and relatively straight course of many of these streams adapts them to display the effects of the earth's rotation under which all moving bodies in the northern hemisphere tend to diverge toward the right of their course. The long Siberian rivers show a decided tendency to leave their left-hand (western) banks, leaving them low, flat, and subject to overflow, while they cut out their right (eastern) banks, making them high and steep. The Siberian towns are practically all riverine. The length and magnitude of the streams greatly favor navigation in its season, and in 1893 there were 107 steamers plying on the streams of Western Siberia, with an aggregate traffic of 322,000 tons. There were also sixty-eight steamers on the interior waters of Eastern Siberia. The ease of river traffic N. and S. is evident, but their great importance also adapts these rivers to an east and west traffic, and Siberia can be crossed from Khatanga to Nikolayevsk, at the mouth of the Amur, almost entirely by water. The principal land stretch is at the western end from Khatanga to Thunin, and this was supplied with a railway in 1893. The principal difficulties to navigation are to be found in shiftings of the channels and in the shortness of the warm season. The rivers are closed by ice from two to eight months; the opening begins at the S. and proceeds slowly N. In front of the open water accumulate great ice-packs, and these serve as dams and cause the most serious floods. Several parts of Siberia are rich in small lakes. The plains of the west are thickly strewn with them, usually shallow, and in the midst of marshes, and their distribution in area and depth is progressing more rapidly from west to east. The plateau of Vitim is also thickly studded with small bodies of fresh water. On the other hand, large lakes are relatively rare. The largest is Lake Baikal, area 10,200 sq. miles, just W. of the plateau of Vitim, long and narrow, in a deep valley between two mountain ranges, drained by the Angara, an affluent of the Yenisei. There are two others with areas between 1,000 and 1,500 sq. miles, two of between 700 and 1,000 sq. miles, three of between 500 and 700 sq. miles, and ten of between 200 and 400 sq. miles.

Climate.—The climate of Siberia is continental, rigorous, and cold. The temperatures are especially low; they are less than around Hudson Bay, but are colder. The mean

annual temperatures through Central Siberia from Tula to Kamchatka are like those of the Yukon basin in Alaska and of Labrador. They vary from a mean annual temperature of 32° F., along a line which extends from Archangel on the White Sea to Lake Baikal and thence eastward, to 14° F.—or 17° below freezing—along a line which extends from Nava Zenshik to Yakutsk and thence northeastward. To the S. of the first line is a narrow strip with the temperatures of New Brunswick and Manitoba. To the N. of the second line the mean temperatures are below 15°, and for a considerable part of the coast are near 0° F. The coldest place known in the world, and not at high altitudes, at which observations are taken is Verkhoyansk (lat. 67° 54', lon. 143° 52' E., on the Yana river), where the mean annual temperature is 2° F. The mean temperature of January is 20° below zero, and the observed minimum is 60° F. below zero. This is the best-known pole of cold on the earth. All Siberia is colder than the average for the other places on the same parallels of latitude, and at this pole of cold it is about 20° colder. At the same time the change of temperature between summer and winter is greater than known elsewhere at low altitudes, and at Verkhoyansk the difference between the January and July mean temperatures is 116°. For the Missouri valley it is only 55°, and for Maudslayi 63° or 70°. With the other continental features Siberia is dry, having a rainfall varying from 5 to 45 inches. In general the rainfall or snow is about that of the Great Plains E. of the Rocky Mountains, but in the northwest it is still less. The principal rainfall is in summer and autumn. Hailstorms are not rare, and are very destructive to stock toward the end of winter.

Mineral Productions.—The most productive metalliferous districts of Russia are along the Ural, and especially in those governments which lie partly in Asia, partly in Europe. It is not always possible therefore to separate the Asiatic from the European statistics, but the Asiatic variant of the Ural is in general much richer in mineral products than the European. Siberia is celebrated for her gold, platinum, and precious stones. The mines belong chiefly to the state, and their income to the imperial family. Gold is for the most part from places in the Ural and Altai Mountains, but has been found in several other districts. The production began in 1736, reached its maximum in 1825-50, and has since declined, except for a favorable fluctuation in 1871-76. The total production of the Russian empire (mostly from Siberia) in 1876 has been estimated at two-thirds of a billion of dollars, and the annual product remains about one-sixth of the world's total output of gold—in 1892 it was 1,168,011 oz. Russian platinum is from the Ural, chiefly from the Asiatic slope in Perm. Most of the platinum product of the world comes from this area. Mines of precious stones are numerous, and their product large, and the best are on the eastern slope of the Ural—diamonds, sapphires, emeralds, superb beryl from several places in Perm, aquamarines and topazes from Herson in Orenburg, etc. There are equally rich mines in the Altai Mountains and in Transbaikalia. Silver, copper, iron, carbon, graphite, and rock-salt are also important products.

Flora and Fauna.—The flora is very varied, as might be expected for so large an area, but it falls naturally into five principal types, viz., that of Kamchatka and the islands, which is closely allied to that of the Aleutian islands of the U. S.; that of the Amur basin, which is a continuation of the Manchurian; that of the southwest steppes, which are an extension of those of Russian Turkestan; that of the tundras along the Arctic Ocean; and that of the forests covering Central Siberia, an extension of those of Russia. The tundras have a considerable variety of low woody plants or shrubs, especially of the genera *Rubus* and *Fumexium*, also alders and willows. Mosses predominate, but some flowering plants extend even to Cape Chukotsk. The northern margin of the forest area is generally formed by two species of larch which, between the Yenisei and the Kolyma, reach N. of the Arctic Circle, sometimes passing the parallel of 70° N., and on the Bay of Khatanga reaching 72° 30' N. W. of the Yenisei the margin of forest growth descends below the Bays of Tazovsk and Obi, and E. of the Kolyma the forest-line descends rapidly southward to Kamchatka. Next to the larches come the pines, spruces, the poplar, and birches, and the last replaces the larches in the extreme east. The forest area of Siberia is enormous. That of Tomsk and Tobolsk is estimated at 250,000 sq. miles, and probably this is only a third or a quarter of the area for all Siberia, but the forests are visibly decreasing in Asiatic as in European

Russia. The Siberian forests are sometimes dense and continuous, but they are more often open, with intervening prairies. The oaks, lindens, and maples are found only on the Pacific versant, and here they are of unfamiliar species. The common fruits—the apple, pear, cherry, gooseberry—do not flourish in Siberia, but the hop is very common. The northern limit of cereals is about 60° N. lat. in the basin of the Obi, and rises to 61° or 62° in Yakutsk and the Aldan basin, but descends to 54° N. on the Sea of Okhotsk and in Kamchatka. They do not flourish on the elevated plateaus.

The fauna is not unlike the European, except in the southwest, where it is like that of Turkestan, and the southeast, where it is closely allied to the Manchurian. The northern shores have the reindeer, the northern hare, two species of fox and a wild dog, two species of lemmings, and the Siberian bear, the last becoming more and more rare. The mammoth and a rhinoceros abounded in these plains apparently at a time antedating the Glacial epoch. Farther S. animal life is abundant, and even the tiger penetrates into the Amur valley. Lake Baikal, though a body of fresh water, has its own species of seal, and the waters, both running and standing, abound in fish. Among the domesticated animals is the reindeer, which here descends to lat. 50° N. on the mountains bordering on Mongolia, where its habitat touches that of the camel. Siberia offers abundant pasturage, and is especially suited to the raising of live stock. According to recent estimates, it possessed over 2,000,000 each of horses and horned cattle, nearly 3,000,000 sheep, 500,000 swine, 200,000 goats, 146,000 domesticated reindeer, and 3,600 camels. The collection of furs (fox, ermine, marten, sable, bear, squirrel) forms an important industry.

Agriculture.—The amount of arable land is estimated at from one-third to one-fifth of the total area, more in proportion in Western than in Eastern Siberia. The maritime province, adjoining Manchuria and the Pacific, is more favorable for agriculture, so far as climate and water-supply are concerned, but it is little known. Agriculture is very primitive, but the virgin lands yield enormous crops. The chief crops are wheat (spring and winter), rye, oats, barley, the potato, and tobacco. There are few manufacturing industries. Trade is mostly with European Russia, but is very profitable, with high prices and high rates of interest.

Population.—The population is most dense over a long and slender triangle, whose base is on the Ural Mountains, and whose axis passes from Ekaterinburg to Vladivostok, through Lake Baikal. In this space the greater portion of the inhabitants are of European descent, mostly Russians, with a few Poles and still fewer Germans. N. of this area, and over three-fourths of Siberia, the population is very sparse, and consists of tribes of Finnish relationship in the west (Ostiaks, Samoyedes, etc.) and of uncertain relationships in the east (Chukchees, Koriaks, Kamchadales, etc., with a few Eskimos about Cape East). S. of the area above described are Turco-Tartars in the west (Kalmuks, etc.) and Mongols in the east (Buriats, Tunguses, etc.). The Buriats occupy much of the Amur valley, and the Tunguses extend northward into the Yenisei basin until their area adjoins that of the Samoyedes. There are also a few thousands of Jews and gypsies scattered through Siberia. The abundant archaeological remains show that Siberia has been occupied from the earliest times, and the peoples along the Arctic coast appear to be the ethnic remnants of the aborigines. Peoples of Turkish or Mongolian races in wave after wave have swept over the country and left remnants of their own tribes in its southern parts. The lot of the indigenes, whether aboriginal or not, is not pleasant. Oppressed by imposts of the nature of tribute, robbed of their lands most suited for the chase, fleeced by functionaries and merchants, exposed to new and destructive maladies, and demoralized by spirituous liquors, their number is decreasing rapidly.

The religions are as diverse as the peoples. The Russians are generally Orthodox, but many dissenters have been deported. The Poles are usually Roman Catholics, the Tartars Mohammedans, the Mongols Lama-Buddhists, and the northern indigenes pagans of the Shaman type. Missionary effort is active throughout the country, and especially in the west. Many of the indigenes profess Christianity.

The conquest of Siberia was begun in 1582. The latest addition to its territory was SAGHALIEN (q. v.) in 1875. From the beginning a stream of voluntary colonists has poured into Siberia from European Russia, although immigration was at times forbidden by the Government and is strictly regulated. The number of such colonists from 1860 to 1880 is officially estimated at about 100,000. In the latter part of

the eighties it had increased to about 35,000 per year, and since the Samara famine it has greatly increased and is estimated to have been 100,000 in 1892.

Increase through Deportation.—Deportation to Siberia was important in the seventeenth century, and adds annually about 20,000 to the population, of whom about one-fourth are voluntary, accompanying their families. From 1823 to 1869 there were over 600,000 persons deported to Siberia, and of them 167,000 were voluntary. About 15 per cent. of the deported were women; 12 per cent. were sentenced to hard labor, 20 per cent. to loss of civil rights, 13 without such loss, and 24 were free to change residence in Siberia; 52 per cent. were deported by executive act, or otherwise without process of courts. When deported they are sent to prisons at Tiumen and thence distributed, some to the extreme north, some to hard labor in mines in the Amur, some to the convict island of Saghalien, but generally to some less remote or less forbidding place where the chief reminder of their condition is the strict police surveillance to which they are subjected. The political exiles are the most intelligent and worthy, but the worst treated. The criminals sometimes become vagabonds, and may continue their unlawful careers. The exiles in Siberia make 5 per cent. of the population as a whole—1 in Yakutsk, 3 in Tomsk, 4 in Transbaikalia, 5 in Tobolsk, 10 in Yeniseisk and Irkutsk, and in Saghalien about 70.

Vital Statistics, etc.—Aside from the unfavorable conditions induced by the introduction of criminals by deportation, the social state of Europeans in Siberia is not bad. The birth-rate is very high (45.5 in 1890) and the death-rate somewhat high (31), but not so high as in European Russia. Only 9 per cent. of the population as a whole live in the towns. The number of females (1888) surpassed that of the males by 1 in 100. In 1891–92 there were 1,446 primary schools with 49,118 pupils, 55 middle schools with 7,401 pupils, 17 professional schools with 974 pupils (only 75 girls in the last), and a university at Tomsk, opened in 1887.

Means of Communication, etc.—A telegraph line extends from the Urals to Nikolaevsk at the mouth of the Amur. Besides the railway to Tiumen one across the country from Orenburg to Vladivostok was begun in 1892, and is (1895) well advanced. The section from Cheliabinsk (where it connects with the European system) to Omsk is already completed, as is also a piece 255 miles long at the eastern end, extending N. W. from Vladivostok. The chief towns are Omsk (pop. 54,721 in 1890); Irkutsk (50,274); Tomsk (41,856); Tiumen (35,396); Tobolsk (21,336).

LITERATURE.—The encyclopædic and more complete works on Siberia are naturally in Russian, and the German literature is large. The following are the works available in English and the more classical of the German books: Middendorff, *Reise in dem äussersten Norden und Osten Sibiriens* (4 vols., 1851–60); Kennan, *Tent-life in Siberia* (1870), a magazine article by this author; Seeböhm, *A Visit to the Valley of the Yenisei* (1879); Mudge, *Fur-clad Adventures through Alaska, Kamchatka, and Eastern Siberia* (1888); Nordenskiöld, *Voyage of the Vega* (1881); Iadrintzef, *Sibirien, geographische, ethnographische, und historische Studien* (trans. from Russian, 1886); Landsell, *Through Scythia* (2 vols., 1882); Woeikof, *Die Klimate der Erde* (2 vols., 1887); De Long, *Voyage of the Jeannette* (2 vols., 1881); Melville, *The Lena Delta* (1885); *Lenamündung* of the Russian International Polar Expedition; Price, *From the Arctic Ocean to the Yellow Sea* (1892).

MARK W. HARRINGTON.

Sibilants [from Lat. *sibilans*, partic. of *sibilare*, to hiss]: in phonetics, a group of fricatives or spirants characterized by a hissing sound. This hissing sound is produced by a current of breath directed by the blade of the tongue against the teeth. The commonest examples are *s* as in *sun*, *sh* (ʃ) as in *shine*, *z* as in *zinc*, *zh* (ʒ) as in *azure*; *s* and *sh* are voiceless, *z* and *zh* are voiced; *s* and *z* are produced by a sharper or more concentrated current of breath than *sh* and *zh*, in which the tongue is drawn back and the point slightly raised. See SPIRANTS and CONSONANT.

BENJ. IDE WIEFLER.

Sibler, WILHELM, Ph. D.: clergyman; b. at Breslau, Prussia, Nov. 12, 1801. After a gymnasium course he served for two years and a half in the Prussian army, rising to a lieutenantancy; studied in the military school at Berlin; abandoning military life, studied philosophy and philology in Breslau and Berlin; gymnasium professor at Dresden 1834–37; tutor in Livonia, Russia, 1837–41. Having studied the-

might certainly, he answered an appeal for Ragman missionaries for the U. S. and removed to North America in 1832. He became a member of the Joint School of Ohio, and for a brief time a pastor at Painesville, O., and then at Fort Wayne, Ind. He founded a seminary at Fort Wayne, Ind. (1836), of which he became professor, and was one of the founders and leaders of the Synod of Missouri. He was the author of *Narrative in the Hapsburg and Lippold of the Missouri River*, and of various controversial tracts. (D. Oct. 21, 1883. His biography (Lithuanian) in two volumes was published at St. Louis, Mo., 1880. H. K. JAMES.

Sidley, Henry Roberts: soldier; b. at New Rochelle, La., May 28, 1816; graduated at the U. S. Military Academy July 1, 1838; appointed second lieutenant of Second Dragoon Regt. June 1, 1840; captain 1847, and major (1848-1851); served in Florida was 1838-39 and 1840-41; adjutant of his regiment 1841-49. In the war with Mexico he participated in the siege of Vera Cruz, battles of Cerro Gordo, Churubusco, Chapultepec, Molino del Rey, and final capture of the city of Mexico, gaining the brevet of major for gallantry in the affair at Molino, near Vera Cruz, Mar. 28, 1847. Before the civil war he was actively engaged in frontier duty and on numerous expeditions, notably the Utah expedition (1857-58, 1859-60), and that against the Navajos (1860). The breaking out of civil war in 1861 found him in New Mexico, where he resigned from the U. S. army, in which he had just been promoted to the rank of major (May 12), and entered the Confederate service, in which he was soon a brigadier-general. Having organized a brigade in Northwest Texas, he left Fort Bliss in Jan., 1862, with between 2,000 and 2,500 men, to effect the conquest of New Mexico, and Feb. 18 appeared before Fort Craig, commanded by Col. R. S. Canby. The action of Valverde was fought Feb. 21, closing by the withdrawal of Col. Canby's troops to the fort. Albuquerque and Santa Fe were occupied by Sidley in March, but the following month he was compelled to evacuate the territory and return to Fort Bliss. After the close of the war he was in the service of the khedive in Egypt as brigadier-general 1869-72. He was the inventor of the tent known by his name. D. at Fredericksburg, Va., Aug. 22, 1880.

Revised by JAMES MARRAS.

Sidley, Henry: financier; b. at North Adams, Mass., Feb. 8, 1807; was a shoemaker by trade; removed early to New York state, where he became a machinist, and also engaged in manufacturing machinery. When telegraphy came into practical use he associated a few gentlemen with himself, and bought or leased several unsuccessful lines, until finally over twenty corporations were merged into the Western Union Telegraph Company. Sidley subsequently conceived the idea of a line to California, and was mainly instrumental in carrying through Congress, in the face of the most intense opposition, a bill which secured a line to the Pacific coast. He also completed negotiations with the British and Russian governments for a European line across Bering Strait. The Atlantic cable proved a success and, consequently, the Asiatic line followed. He engaged in railway-building, in manufacturing timber and saw, wool-raising, and in farming on a large scale. He expended \$200,000 in founding Sidley College of Mechanical Engineering at Cornell University, and \$100,000 on a fireproof library building for the University of Rochester. D. at Rochester, N. Y., July 12, 1888.

Sidharp, Jura, M. D., P. R. S.: botanist; b. at Oxford, England, Aug. 28, 1758; graduated at Oxford University about 1785; studied medicine at Oxford, Edinburgh, and on the Continent; made botanical researches in France, Switzerland, Southern Italy, Crete, Cyprus, Asia Minor, parts of European Turkey, and Greece; Professor of Botany at Oxford; one of the founders of the Linnean Society; made a second botanical exploration of Greece and the Ionian Islands 1794-95; published the *Flora Oecidenalis* (1794); and at Bath, Feb. 8, 1796. He bequeathed to the university £1,200 per annum for the publication of his great work, *Flora Graeca*, which was edited by J. E. Smith and John Lindley (30 vols., royal folio, with 1,000 colored plates, 1897, rev.).

Revised by CHARLES K. BRADY.

Sihyl [from Lat. *sihylus* = Gr. *σῆλη*, *sihyl*]; the name given to certain old women inspired by the god of prophecy. Pausanias of his own story, Aristotle of several, and Varro of two. *Liberia*, the first *sihyl*, was the daughter of Zeus and *Lamia*, and prophesied at Delphi. The second and famous *sihyl* was *Herophile*, a sister or daughter or wife of *Apollon*, who is named of even before the Trojan war. Troy-

land seems to have been her real home, though, from her wanderings in the interior of her god, she was known by a number of other names. So also is the *Sithonian*, *Trojan*, *Carian*, *Melphian*, *Cyrenian*, *Carian*, *Crethronian*, *Sihyl*. She lived for ages, and she it was who sold the books of prophecy to *Thargimus Syriacus*. The twelve extant books of *sihyl* are of late Greek Christian origin, and have nothing in common with the old *sihyl*. J. R. S. MERRITT.

Sicilian Vespers: the uprising of the Sicilian people against the French marriage Charles of Anjou, at Palermo on Easter Day, Mar. 30, 1282. In 1264 Pope Urban IV. had granted the kingdom of the Two Sicilies to the infant Charles of Anjou, brother of King Louis IX. of France. Charles' brutal Manfred at Benevento took possession of the kingdom, and converted the government into an oppressive despotism. This was long borne without organized resistance, but the brutality of a French soldier toward a Sicilian woman produced an outbreak of popular resentment which began with the instant massacre of the French soldiers, and ended with the slaughter of most of Charles' foreign and native adherents throughout the island, and the final overthrow of his domination in Sicily. See *Amari, La guerra dei Vespri Siciliani* (2 vols., Palermo, 1842; many times reprinted).

Sic'lies, The Two: the name given formerly to a kingdom composed of the island of Sicily and the southern part of the mainland of Italy. In 1130 the Norman house (v. s.), King of Sicily, having obtained the Italian territories of Apulia, Capua, Naples, and the Abruzzi, was crowned at Palermo as King of Sicily and Italy, a title afterward altered. Thus was formed a dominion whose two parts were frequently divided and united and transferred from one ruler to another, but always with hardly any change of boundary. Ferdinand the Catholic (1479-1516), King of Aragon and the island of Sicily, conquered the continental Sicily and called himself the king of the Two Sicilies, which then remained united up to 1708. (See *SICILY*.) From 1735 up to their annexation to the kingdom of Italy in 1860 the parts were again united, except during the period 1848-49, when the continental Sicily was ruled over by Joseph Bonaparte and Murat as Kings of Naples. The continental Sicily comprised what are now the two *compartimenti* of Abruzzi e Molise, Campania, Apulia, Potenza or Basilicata, and Calabria, and is divided into sixteen provinces. See FREDERICK IV. (King of Naples), FERDINAND II., FRANCIS I., and FRANCIS II. (Kings of the Two Sicilies). R. A. JONES.

Sicily, *sic-i-le* (Ital. *Sicilia*; Lat. *Sicilia*, *Sicania*, *Trojan*; Gr. *Σικελία*, *Sicilia*, *Trojan*); the largest and most important island in the Mediterranean, lying near the center of that sea, between 36° 41' and 38° 15' N. lat., 12° 00' and 15° 40' E. lon. It is separated from Italy by the narrow Faro or Strait of Messina. Its western extremity, Cape Bon (anc. *Lilybæum Panormitarum*), is 90 miles from Cape Bon in Africa. It forms a nearly isosceles triangle, its shortest side fronting the E. Area, 9,930 sq. miles. Together with the islands Pantellaria and Ustica and the Lipari or *Æolian* group on the N. and the *Ægades* group on the W., it constitutes a *compartimento* of the kingdom of Italy.

Physical Features, etc.—The coast is about 700 miles long, but has few natural harbors. The most important are those of Messina, Catania, Agosta, and Syracuse on the E. and of Palermo on the N.; also in the small harbors of Trapani and Marsala on the W. and in the roadstead of Licata on the S. a large trade is carried on. The most northeast point is Capo del Faro; next S. E., Cape Passero; N. W., Cape San Vito. Near the northeast corner of the island begins a mountain chain corresponding to the Calabrian range on the mainland. Its general direction is S. S. W. to Taormina, then westward, running parallel to and near the north coast with a general elevation of from 2,000 to 3,000 feet. Its highest summit, the Pizzo dell' Antenna or Pizzo di Corno, S. W. of Catania, is 6,478 feet high. There the chain divides into three ridges, or rather series of detached mountains, diminishing in height, which run S. W., S., and S. E. The general surface of the island is an uneven plateau descending toward the S. E. Its most famous and important mountain is the isolated volcanic peak of Etna (v. s.). There are few lakes or ponds. Lago Pergusa, near Castro Giovanni (see *ENNA*), and the *Diavoli* di Lentini, or Lake of Lentini, are the largest. The forests, which were formerly extensive, have been largely destroyed in modern times, not only by volcanic eruptions, as along the slopes of Etna, but by im-

provident felling and abuse of pasturage. In consequence the water-supply is uncertain and limited. The heavy winter rains are of little benefit, being neither absorbed by the soil nor collected in natural or artificial storehouses for the dry season. Still, evaporation from the surrounding seas mitigates the heat, and its condensation on the summits of the northern coast range furnishes a supply of water which, though badly economized, somewhat protects the soil from droughts. The principal rivers are the Giaretta, formed by the union of the Simeto and Gurnalunga, the Cantara, Salso, Platani, and Belici. The numerous smaller streams are often obstacles to internal communication from the violence of their currents in winter and from the difficulty of constructing secure bridges over them. The larger number are dry in summer. The temperature is generally agreeable, except during the prevalence of the parching sirocco. The climate is not unhealthful, except in the many localities rendered almost uninhabitable by malaria.

Minerals.—The minerals correspond with the geologic formations of which the island is composed—Primitive at the N. E., Secondary along the N., and mainly Tertiary through the rest of Sicily. Sulphur and rock-salt are the most important mineral products. The marbles, jaspers, and agates are fine. Lignite and alum are found, and also at the eastern coast amber, usually of a transparent yellow, but sometimes blue or green.

Agriculture and other Industries.—The soil, almost nowhere alluvial, is exceedingly fertile wherever water can be secured for irrigation. Agriculture is carried on only in the rudest and most primitive way, and until recent years insecurity of life and property have prevented investment in rural improvements. Excellent wheat is raised in large quantities, but generally exported, the necessities of the inhabitants being supplied by the importation of a cheaper and inferior article. The vineyards produce delicious wines of various kinds. Hemp, saffron, and sumach are grown. The mulberry is cultivated for the silkworm. Almonds, figs, olives, lemons, oranges, and tobacco are raised extensively. The cultivation of cotton and the sugar-cane has greatly decreased. Manufactures are unimportant and hardly more than supply the wants of the working-classes. Fishing is prosecuted with energy. The tunny is taken and cured at different points along the coast, and sardines and anchovies are shipped to foreign ports in large quantities. Means of intercommunication are very defective. There are few highways, the roads are mostly bridle-paths, and the towns of the interior are generally not accessible by small carriages. In 1894 633 miles of railway had been opened up.

Language and Literature.—The Sicilian dialect resembles that of Calabria. It generally agrees with the Tuscan in vocabulary, but with the frequent substitution of *u* for *o* final, of *u* by *da*, and with the omission of the *u*-sound after *q*; but it possesses many words from the Arabic and others from unknown sources. Though not a literary language, it has ancient chronicles in the popular speech and some modern poems justly admired. Education, though making progress, is still in a backward state, and Sicily is far behind continental Italy.

History.—The earliest known inhabitants were the Sicani or Siculi, who crossed from Italy. At an early period the Phœnicians planted their factories along the coast and introduced the Phœnician worship. They were shortly followed by Greeks, who so thoroughly colonized the island in the eighth and seventh centuries before Christ that all its ancient culture and civilization were of Greek origin; but the colonists, being from many different states, were disinclined to unite in any common organization. The cities they founded were governed by oligarchies or tyrants, but though often at war with each other rose to great wealth and power. The Carthaginians in great force invaded Sicily, but received a crushing defeat at Himera (480 B. C.). Then followed the most brilliant half century of the Greek domination. Troubles among the cities furnished a pretext for the disastrous Athenian expedition (415 B. C.). After 409 B. C. the Carthaginians gradually mastered most of the island, but were sturdily resisted by Dionysius, tyrant of Syracuse. At the close of the first Punic war (241 B. C.) they were forced to cede their Sicilian possessions to the Romans, Syracuse still remaining independent; but all Sicily became a Roman province—the first Rome possessed—at the close of the second Punic war, and so continued until 395, when, on division of the Roman empire, it became part of the empire of the East. Christianity was early intro-

duced, apparently from Rome. Overcome by the Goths, Sicily was delivered by Belisarius and continued a Byzantine possession until 827, when its subjugation was commenced by the Saracens and was completed in 878. Under the Mussulman sway agriculture, manufactures, and commerce steadily increased. In 1061 the wealthy island tempted the Normans under Roger Guiscard, but it was not wholly subdued until 1090. The Normans held it until 1194, when it passed to the Hohenstaufen emperors, who were replaced in 1268 by Charles of Anjou and the French. The massacre of the SICILIAN VESPERS (*q. v.*) ended the power of the latter (1282), and the island came into the hands of Peter III. of Aragon. The Aragonese dynasty reigned till 1504, after which until 1706 Sicily was under the Spanish crown. Then for brief periods it was held by Austria, Savoy, Austria, and Spain, till in 1735 it was reunited with Naples under Don Carlos as King of the Two Sicilies, and was ruled by his house until its liberation (1860) by Garibaldi and its incorporation into the kingdom of Italy. Its condition in the Middle Ages was deplorable. Its nominal independence was limited to control of its internal affairs, while its rulers constantly neglected to defend it against the Mussulmans; but great progress has been made since 1860.

All the ancient peoples who ruled Italy—the Siculi, Phœnicians, Greeks, Carthaginians, and Romans—have left monuments of their occupation. Those by the Greeks are stupendous, and include the vastest and most splendid existing remains of Greek temples. These are specially to be seen at Selinonte, Girgenti (*Agrigentum*), Segesta, Syracuse, and Himera. Even the reconstructed Roman theaters of Syracuse, Segesta, Taormina, and Palazzolo rest on Greek foundations. In Sicily are found very beautiful ancient pottery and unsurpassed medals. Some edifices date from the Byzantines and Saracens, but the most important memorials of the latter are the useful plants, such as sugar-cane and cotton, which they introduced.

Population.—Sicily is divided into the provinces of Catanzetta, Catania, Girgenti, Messina, Palermo, Siracusa, and Trapani. Total population (1881) 2,927,901; 1893 (official estimate), 3,404,665. Principal cities: Palermo, 276,000; Messina, 146,400; Catania, 121,000.

LITERATURE.—See Freeman, *History of Sicily* (4 vols., Oxford, 1891); also Freeman, *Story of Sicily* (New York, 1892); Amari, *Storia dei Musulmani di Sicilia* (3 vols., Florence, 1854–72); Lloyd, *History of Sicily to the Athenian War* (London, 1872); Chiesi, *La Sicilia illustrata nella Storia, nell'Arte, nei Paesi* (1892); Di Giovanni, *Filologia e Letteratura Siciliana* (2 vols., Palermo, 1871); Lo Faso, *Duca di Serradifalco, Antichità della Sicilia* (5 vols., folio); Evans, *The Classic and Connoisseur in Italy and Sicily* (3 vols., London, 1835); also the *Tours of Brydone*, Sir R. C. Hoare, and Simond.

E. A. GROSVENOR.

Siekingen, FRANZ, von: champion of the Reformation; b. Mar. 2, 1481, in the castle of Ebernburg, near Kreuznach, in the present Rhenish Prussia; was one of the wealthiest and most powerful knights of his time, and was treated with much regard both by Charles V. and by the French king, Francis I. He spent all his time in feuds with his neighbors, and, having come into contact with the new religious ideas through his friend Ulrich von Hutten, he formed a plan of carrying through the Reformation by force. As the despoiling of the Roman Catholic Church of all its property and the distribution of its estates among the knights formed the principal points of his plan, he expected support from the nobility, and pamphlets were written and spread among the peasantry in order to arouse them, too, against their ecclesiastical lords; but the attempt entirely failed. One after another his castles were taken, and at last he was compelled to surrender himself, together with his last castle, Landstuhl, near Kaiserslautern. D. May 8, 1523.

Sickles, DANIEL EDGAR: soldier; b. in New York, Oct. 20, 1825; was educated at the University of New York, but left without graduating; learned the printer's trade, then studied law, and was admitted to the bar in 1846. He soon became identified with politics, and in 1847 was elected to the State Legislature as a Democrat. In 1853 he was appointed corporation attorney of New York city, and the same year accompanied Mr. Buchanan to England as secretary of legation. Returning in 1855, he was elected State Senator, and the following year was chosen member of Congress from New York city, and re-elected in 1858 and in 1860. On Feb. 27, 1859, he shot and killed Philip Barton

Ker in Washington for improper intimacy with his wife, and was placed on trial for murder, but acquitted. On the outbreak of civil war he raised the Greenback Brigade, and in June, 1861, was appointed colonel of one of its regiments, the Twenty-fifth New York. In Sept., 1861, he was nominated a brigadier-general of volunteers. The appointment was at first negatived by the Senate, but subsequently confirmed to date from original appointment. In the Virginia Peninsula campaign his brigade was attached to Hooker's division of the Third Corps, in the command of which he succeeded in Sept., 1862, and having been commissioned major-general of volunteers Nov. 30, 1862, was assigned to the command of the Third Army Corps in Feb., 1863. He was distinguished at the battle of Chancellorsville May 2-4. At Gettysburg he lost a leg early in the second day's fight. In 1865-67 he commanded the military district comprising North and South Carolina. On July 28, 1866, he was appointed colonel of the Forty-second Infantry of the regular army, and in Apr., 1869, was retired from active service with the rank of major-general. In the latter year he was appointed U. S. minister to Spain, which position he resigned in 1872. Returning to New York he became president of the State board of civil service commissioners. He received the honors of brigadier and major-general U. S. army for gallantry. In 1866 he was appointed minister to Belgium and in 1869 minister to Mexico, but declined both positions. In 1890 he was appointed sheriff of New York by Gov. Hill, and in 1892 was elected to the Fifty-third Congress.

Sicyon, *sí-sí-on* (Gr. *Síkyon*): capital of the province of Sicyonia, in the Peloponnese, which was founded on the N. in the Corinthian Gulf, on the W. by Achaea and Argolis, on the E. by Cleone and Phlacha, on the S. by Corinth. Its site is occupied by the village of Vasilika. Sicyon was distinguished in earliest times as the original home of painting and bronze-casting. In history Sicyon played only a secondary rôle. Excavations have been made by the American School of Classical Studies at Athens. J. H. S. S.

Siddons, *Sí-don*: actress; daughter of Roger Kemble; b. at Brecon, South Wales, July 5, 1755; played as a girl in her father's company; married Mr. Siddons, an actor, at the age of eighteen; made her first appearance at Drury Lane, with Garrick, as Portia in *The Merchant of Venice*, in 1772, but, made no mark; retired in disappointment, but played in the provinces with success, and reappeared in London in 1782. This time she made a deep impression as Isabella in *The Fatal Marriage*, and began her career of extraordinary success. For thirty years, until her retirement June 29, 1812, she was the queen of the English stage. Her favorite and famous characters were Lady Macbeth, Queen Gonzago, Queen Catharine, Jane Shore, Isabella, Ophelia, Desdemona, Portia, and Imogen—impersonations of tragic pathos and melody. To her contemporaries she was a prodigy of genius. Yet in the opinion of judges her ordinary reputation was imperfect. Her effects were produced by passion, action, attitude, expression of voice and countenance, and by intense concentration of feeling, which lifted and dilated her form, transporting her audience as well as herself. The public readings she gave from Shakspeare after her withdrawal from the stage did not add to her fame. Her last appearance as an actress was in 1818, when she played for Charles Kemble's benefit. Thenceforth she lived in retirement, honored as a woman of stainless reputation, and respected in all the relations of life. D. in London, June 6, 1831. Her portrait was painted by Sir Joshua Reynolds, and is one of his best; her *Life* was written by Thomas Campbell (1834) and by Mrs. Kemble (London, 1896).

Revised by R. B. VALLENTINE.

Sidell, *Wí-li-am* *Hevry*: soldier; b. in New York, Aug. 11, 1810; graduated at the U. S. Military Academy, sixth in his class, July, 1833, when assigned to the First Artillery as second lieutenant; resigned the following October, and adopted the profession of civil engineering. For a time he was a city surveyor of New York, an assistant engineer on the Croton aqueduct, and division engineer of railroads in Massachusetts and New York; was assistant engineer in the hydrographic survey of the delta of the Mississippi river; in 1851-52 was assistant in the exploration and survey of a railway route across the Isthmus of Tehuantepec. The work of construction was abandoned till 1858, when he became chief engineer. On the outbreak of civil war he was commissioned major of the Fifteenth U. S. Infantry, but without joining his regiment was at once assigned

to duty as mastering officer in the department of the Cumberland. In July, 1862, he was detailed as acting assistant adjutant-general of that department, continuing so much until transferred to Louisville, May, 1864, as acting assistant provost-marshal-general of Kentucky, resuming soon after the duties of general superintendent of recruiting and chief mastering officer of the state. In 1867 he joined his regiment, the Tenth Infantry (to the lieutenant-colonelcy of which he had been promoted in 1864), with which he served in Dakota Territory until 1869, when placed in charge of the depot of the general recruiting service at Fort Lawrensvorth, Kan. He retired from active service Dec. 15, 1870. D. in New York, July 1, 1874. For meritorious and faithful services in the war he was breveted colonel and brigadier-general U. S. army.

Sid'elite [from (Gr. *sídeas*, iron); the mineralogical name for spathic iron ore. See IRON.

Sidgwick, *Sí-dj-ik*, *Lí-f*, D. L. E. D. C. L.: philosopher and economist; b. at Skipton, Yorkshire, England, May 31, 1838; educated at Rugby School and Trinity College, Cambridge; became fellow and lecturer at Trinity College 1859, reader in moral sciences in 1875, and Professor of Moral Philosophy in Cambridge University in 1883. He has published *Methods of Ethics* (1874; 4th ed., 1894); *Principles of Political Economy* (1883); *Outlines of the History of Ethics* (1886); *Elements of Politics* (1891); and many articles and special publications. J. M. B.

Sidmouth, *Sí-dm-uth*, *Viscount*: statesman; b. at Reading, England, May 30, 1757; educated at Winchester School and at Brasenose College, Oxford; studied law; was admitted to the bar 1784; entered Parliament the same year through the influence of the younger Pitt, to whom he gave an efficient support during his administration; was Speaker of the House of Commons from 1789 until 1801, when, on the resignation of Pitt as Prime Minister, he formed a new ministry, accepting the posts of Chancellor of the Exchequer and First Lord of the Treasury; directed the negotiation of the Peace of Amiens 1802; supported a war policy 1803; resigned office 1804; was raised to the peerage and made president of the council Jan. 12, 1805; was Lord Privy Seal in the Grenville and Fox ministry 1806-07; was Home Secretary 1812-22, and a member of the cabinet without a portfolio 1822-24, when he became unpopular on account of his coercive measures, after which he retired from public life. D. at Richmond Park, Feb. 15, 1844.

Sidney: village; capital of Shelby co., O.; on the Miami river, the Miami and Erie Canal, and the Cin., Ham, and Dayton, and the Cleve., Cin., Chi. and St. L. railways; 31 miles S. of Lima, 40 miles N. of Dayton (for location, see map of Ohio, ref. 4-U). It is in an agricultural region, is principally engaged in manufacturing, and contains a public high school, public library (founded in 1886), 2 private banks, and a daily and 4 weekly newspapers. Pop. (1880) 3,523; (1890) 4,550.

Sidney, or **Sydney**, *Al-berny*: revolutionist; b. at Penshurst, Kent, England, in 1622, a son of the second Earl of Leicester; in 1632 accompanied his father, who was appointed ambassador to Denmark, and four years later to France. In 1641 he served as captain of a troop of horse in Ireland, of which his father had been made lord-lieutenant. When the great rebellion broke out, he took the side of the Parliament, and was made a captain of horse in the regiment of the Earl of Manchester. He was severely wounded at the battle of Marston Moor July 2, 1644; and in 1645 was made colonel of a regiment in Fairfax's army and governor of Chichester. In 1646 his brother, Lord Lisle, was appointed Lord-Lieutenant of Ireland, and he was made lieutenant-general of horse and governor of Dublin; in 1647 he received the thanks of the House for his services in Ireland, and was made governor of Dover. In 1648 he was one of the judges at the trial of Charles I., but was not present when sentence was passed, and did not sign the warrant for the execution, though he afterward characterized it as "the justest and bravest action that ever was done in England or anywhere else." Being opposed to the protectorate of Cromwell, he retired from Parliament in 1653, but when the Long Parliament was restored in 1659, he resumed his seat, and was named one of the council of state, and was sent as one of the

English commissioners to negotiate a peace between Sweden and Denmark. He was absent from England at the time of the Restoration, and, not acceding to this, he lived abroad in exile for nearly eighteen years. In 1677 he received a pardon from the king, with permission to return to his native country; twice unsuccessfully stood for a seat in Parliament, and was considered as being in league with Monmouth, Essex, William Lord Russell, and other popular leaders. The discovery of the Rye House plot in 1683 gave the court an opportunity of ridding itself of so dangerous an opponent. He and Russell were arrested and committed to the Tower on a charge of high treason. The only witness as to the main facts charged was Lord Howard, who by his own confession had been a party to the plot, and was ready to swear away the lives of his associates in order to save his own. The law required two witnesses to prove the alleged crime, and under the decision of the infamous Chief Justice Jeffreys the other witness was found in a manuscript on government which had been discovered among the papers of Sidney, in which it was maintained that a people had the right to depose an unworthy sovereign. The trial was opened Nov. 7, 1683; sentence was pronounced on the 26th; and on Dec. 7 he was beheaded on Tower Hill, London, and buried the next day at Penshurst. The reversal of the act of attainder was one of the earliest acts of the first Parliament of William and Mary. His *Discourses concerning Government* was published in 1698, and a 4th ed., with some miscellaneous writings, in 1772. *Lives of Sidney* have been written by Meadley (London, 1813), Van Santvoord (New York, 1851), and A. C. Ewald (London, 1873).

Sidney, or Sydney, Sir PHILIP; author and statesman; b. at Penshurst, Kent, England, Nov. 9, 1554; studied at Oxford and at Cambridge; traveled extensively, visiting Belgium, Germany, Hungary, and Italy, in all of which countries he was noted for his skill in knightly exercises as well as for his fondness for literature and art. He returned to England in 1575, and, aided by the influence of his uncle, the Earl of Leicester, rose to high favor at court. In 1576 he was sent on a mission to Vienna, but after his return he lost the queen's favor, probably in consequence of his bold remonstrance against the project of her marriage to the Duke of Anjou, and retired for a time to the seat of his brother-in-law, the Earl of Pembroke, where he devoted himself mainly to literary pursuits. Here he wrote, between 1579 and 1581, his pastoral romance *Arcadia*, which was never completed, and his *Defence of Poesie*, upon which his literary fame mainly rests. In the meantime the queen's favor for him revived, and he took a prominent part in all pageants of the court. He fell deeply in love with Lady Penelope Devereux, afterward Lady Rich and Lady Mountjoy, whom he celebrated under assumed names in his *Arcadia* and in the series of love sonnets entitled *Astrophel and Stella*, published soon after his death (1591). In 1593 he was knighted, and married the daughter of Sir Francis Walsingham. In 1585 he wished to join Sir Francis Drake in his second expedition against the Spaniards in the West Indies, but the queen forbade this, fearing, as she said, "lest she should lose the jewel of her dominions." It is said, probably without good grounds, that the crown of Poland was offered to him. The war was raging between Spain and the Netherlands, and Elizabeth made some show of assisting the Dutch. In 1585 Sidney was appointed governor of Flushing, and soon after was made general of horse under his uncle, the Earl of Leicester, in which capacity he gave promise of much military ability. On Sept. 22, 1586, he encountered a body of the Spaniards under the walls of the town of Zutphen. Sidney was severely wounded, and died at Arnheim, Oct. 7, 1586. The well-known story of his refusing the cup of wine, when fainting from loss of blood, in order to give it to a wounded soldier, has been questioned, but, whether true or false, well illustrates his chivalrous and generous character. His body was conveyed to England, where it lay in state for several days, and a general mourning, the first of the kind in English history, was observed. Sir Philip Sidney is perhaps the best English model of knightly virtues, and his character has always been a favorite theme with poets. His writings had great celebrity in their day, but they are marked by the strained and artificial style of the period. His *Arcadia* was first published soon after his death (1590) as *The Countess of Pembroke's Arcadia* (reprinted, London, 1868). His *Complete Works* appeared in London in 3 vols. in 1725; his *Miscellaneous Works*, with a

memoir, were published at Oxford in 1826, reprinted at Boston in 1860; his *Complete Poems*, edited by Rev. A. B. Grosart, were published at London in 1873. See the *Life*, by J. A. Symonds (London, 1886; 2d ed. 1889). See ENGLISH LITERATURE.

Sidon, or Zidon [from Lat. *Sidon* = Gr. *Σιδών*, from Heb. *Tsidhōn*, Sidon, liter., fishing-place]: an ancient city in Phœnicia, on the Mediterranean, in lat. 33° 34' N. (see map of Palestine, ref. 3-E). Its origin, lost in antiquity, is due, according to Josephus, to Sidon, the oldest son of Canaan, and it is referred to even in the book of Genesis. Celebrated for its manufactures and commerce, its name was applied to the whole country and nation. Homer calls the Sidonians "skillful in all things." Sidon had trade-stations in Sicily, Sardinia, Spain, and Northern Africa; its fleets visited the British islands and the Baltic; and its purple, glass, linen, gold, silver, and ivory wares were famous a thousand years. Its most brilliant period began about 1600 B. C., but it was ultimately eclipsed by Tyre. Captured by Shalmaneser, King of Assyria, about 720 B. C., it was almost utterly destroyed during its revolt against the Persian Artaxerxes (351 B. C.). Rebuilt, it never regained its former splendor. Under the Greek, Syrian, and Roman dominion, it further declined. Alternately held during the crusades by the Christians and Mussulmans, it was razed by Malek Ashraf in 1291. In the vicinity were discovered (1887) sarcophagi of unsurpassed workmanship (now the chief treasure of the Museum of Constantinople), one of which is perhaps that of Alexander the Great.

Siebold, zee'bōlt, PHILIPP FRANZ, Freiherr von: traveler, physician, zoölogist, and botanist; b. at Würzburg, Bavaria, Feb. 17, 1796; studied medicine and natural sciences; entered the service of the Dutch East India Company, and was appointed leader of a scientific mission which arrived at Nagasaki in 1823. He soon acquired an extraordinary influence over the Japanese, whose language he mastered, and in 1826, when he accompanied the Dutch embassy to Yedo, he was allowed to remain behind, the only foreigner in the hermit city. The sale of a map, however (see Ixoa), brought him into difficulties, and after a term of imprisonment he was finally banished from the country in 1830. On his arrival in Holland he was created a baron, and spent the next twenty-nine years of his life in writing and in arranging his scientific collections at Leyden, Munich, and Würzburg. European gardeners owe to him the introduction of Japanese lilies, peonies, camellias, chrysanthemums, and other attractive plants. At the close of his life he returned to Japan. His great work is a folio, magnificent y illustrated, *Nippon, Archiv zur Beschreibung von Japan*. D. at Munich, Oct. 18, 1866.

J. M. DIXON.

Siedlee, si-ed'lt'sā: town of Russia; the capital of the government of Siedlee (see map of Russia, ref. 8-A). It has a fine palace surrounded with beautiful gardens, distilleries, sugar-refineries, and manufactories of agricultural implements. Pop. (1890) 14,015, two-thirds Jews. The government of Siedlee, comprising an area of 5,535 sq. miles, with 671,598 inhabitants in 1890, is situated to the W. of the river Bug, between the governments of Lomza, Warsaw, Radom, Lublin, Volhynia, and Grodno, and occupies nearly the same territory as the old palatinate of Podlachia.

Revised by M. W. HARRINGTON.

Siege [from O. Fr. *siege*, Fr. *siège*, deriv. of *regier*, to siege; Span. *sitiar*; Provenc. *setjar* < Lat. **sedicare*, deriv. of *sedere*, sit]: the investing of a fortified place by an enemy for the purpose of compelling its surrender by continued offensive operations. Modern fortresses are of two general types—single fortresses, consisting of an enceinte and its outworks (see FORTIFICATION), and intrenched camps, consisting of the former combined with detached works. (See INTRENCHED CAMPS.) The latter may be defended simply by its garrison or by a large army in addition to the garrison. The methods of attack will vary with these different circumstances, and may be classified as (1) siege of a single fortress; (2) siege of an intrenched camp defended by its garrison simply; and (3) siege of an intrenched camp occupied by an army.

1. The method perfected by Vauban in the latter half of the seventeenth century applied to the first case, and under ordinary circumstances with the proper force—five or six

though the garrison was almost certain of success. This method has been employed without essential change for 100 years, and it is only within a very brief period that military engineers have found it necessary to introduce some modifications in order to adapt it to modern instruments of war. It consists, in brief, in taking up a strong entrenched position in front of the work, beyond the range of the artillery, and throwing a path thence to the interior. To do the latter it is necessary to maintain the fire of the work, to batter down a portion of the scarp, and to excavate a path by which troops can advance under cover. The occupation of the ground is called the investment. The invasions on the side of the work are called lines of circumvallation. Sometimes defenses are thrown up to guard against attack from the exterior; these are called lines of circumvallation. The covered roads constructed toward the work are called approaches, *saps*, or *trenches*. To prevent their being cut off they are run in a zigzag direction, each branch being so placed that its prolongation shall fall outside the salient of the parallel works. Whenever it is practicable several *saps* are pushed forward simultaneously from different points and converge toward the point of attack. During the earlier portions of the siege these approaches are constructed by digging a trench and throwing the earth up on the side toward the enemy, thus forming a simple trench. When within easy range of artillery, cover is more quickly obtained by placing a row of gabions and filling them with earth. This is called a *flying sap*. During the latter portions the excavation is pushed forward by sappers, foot by foot, under the cover of a rolling shield called a *sap roller*. It is covered with gabions and is called a *fall sap*. As the heels of these approaches offer an easy prey to shells they are built from distance to distance by lines of trench running nearly parallel to the front of attack. These are called *parallels*. They are arranged for infantry defense something like rifle trenches (see *Fortifications*), but their bottoms are made wider to afford means for the free circulation of troops. Each parallel should be nearer to the preceding one than it is to the work attacked, and must be within easy supporting distance from it. The number of parallels therefore depends upon the distance of the first one from the work, and that depends upon the range of the artillery. In Vauban's time there were usually three; at Salasquid in 1654, 24 there were seven. When the approaches have advanced within easy artillery range—the second parallel—batteries are constructed to silence the artillery of the works. When practicable, they are placed on the prolongation of the faces of the work. The artillery fire having been silenced, the approaches are pushed forward toward the foot of the glacis. In the old method, when within a short distance from it, mounds of earth, called *trenches*, were thrown up to command the secretway, and served to drive out the defenders. Their construction is now considered impracticable. The occupation of the crest of the secretway is called the *crowning of the glacis*. Here, in the old method, breaching batteries were constructed to batter down the scarp and a gallery was excavated to lead into the ditch, the advance through the ditch and breach being continued with the fall sap or by assault. In these operations the sapper goes hand in hand with the sapper. He searches out and destroys the countermines, creates large craters in which the sapper can make lodgments, and is frequently employed to make the breach.

The driving of a fall sap, and the establishment of these breaching batteries, in the later stages of the siege, always difficult, may be said to have become of late years impracticable, assuming always that the defense is vigorous. At Salasquid the fortifications were not strong, their profile that of fieldworks. At the siege of this place, which lasted eleven months, during which the French executed 47 attacks and the British 8 miles of trenches, the approaches were reached the ditch. At the final assault the ramparts were taken, and the troops had to advance without cover, at some points more than 200 yards. The assault failed at six points out of seven, and it was the opinion of Gen. Niel, commander of the French engineers, that the place would have been impregnable if it had been provided with good revetted *scaups*. This opinion, however, assumes that the scarp remained unbreached, and it is qualified by the statement that the place possessed an armament such as is only found in a great maritime arsenal, and a garrison perpetually replenished by communication kept open with the interior of Russia. Since that date further great improvements have been made in the caliber, range, and accuracy

of artillery fire, as well as in small arms. It has become possible to effect the breach by indirect fire from a distance, while the difficulties of the assault have been proportionately increased. The introduction of machine-guns and of the breech-loading musket, by means of which a thin line of troops can keep up a steady sheet of fire, has rendered impracticable the open assault of even slight intrenchments if immediately defended. It has fair chance of success, however, when made from a point close up to the works, and against a garrison worn out with the labor and anxiety of a long siege, or when following closely after the explosion of a mine.

The prompt capture of many of the single fortresses of France during the Franco-German war of 1870-71 has had little bearing on the subject, as many of them were of an ancient pattern, none was in a complete state of preparation, the artillery was inferior to that of the enemy, and the defense was often lukewarm or unintelligent, or both. The method of the Germans was to observe the place by detachments until operations in the field afforded leisure for a serious attack against them, and then to plant powerful batteries at distances varying from 1 to 2 miles, and bombard them until they capitulated. The bombardment of Sedan lasted 5 days; of Neuf-Brisach and Fort Moltke, 5 days; of Tilsen, which had been besieged three months, 2 days; of Montmédy, after four weeks' investment, 2 days; of Longwy, which had been invested seven weeks, 8 days; of Metz, after being observed by detachments three months, and regularly invested ten days, 14 days; of Belfort, 7 hours with field artillery; of Toul, after being observed four weeks by a brigade and closely besieged by a division eleven days, 8 hours; of Nancy, 4 days; of La Fère, after ten days' investment, 30 hours; of Péronne, after six days' investment, two of them employed in bombardment with field-guns, 7 days, etc. These facts do not militate against the value of these fortifications in themselves. Even defended as they were, they caused great annoyance and delay to the invaders, and they enabled the hastily organized armies of Prussia to make a defense of which otherwise they would not have been capable. Plaisance required a blockade of over four months for its reduction, and Biele held out to the end of the war. Verdun resisted a *coup de main* Aug. 24, was observed by detachments until Sept. 23, when it was closely invested, resisted a bombardment of 54 hours from captured French guns Oct. 14-16, but surrendered Nov. 8 without standing a regular siege, after preparations had been made for carrying it on with German artillery. Strasburg, with a garrison of 17,000 men, resisted for 51 days a besieging army of about 60,000. The attack was by regular approaches, the out-works being breached by distant fire and by mining, and the main rampart by the fire of batteries in the second parallel. Three batteries, called demolition batteries, were about 800 yards from the place, and effected their purpose by indirect firing, the masonry not being visible. The crowning of the glacis was successfully accomplished, followed by the descent into the ditch. The ditches, being filled with water, were crossed by dams, or, where the water was deep, by floating bridges of barrels floored over with planks. Everything having been prepared for the assault, the garrison capitulated without waiting to receive it.

In a vigorous defense of a single fortress the enemy will be kept at a distance as long as possible by the occupation of favorable points on the exterior. His approaches and other works will be harassed or destroyed by a concentrated artillery fire, with occasional sorties in large bodies. Counterapproaches will be run out to obtain favorable positions for enfilading his lines, and sharpshooters will be posted in rifle-pits well to the front to pick off his gunners. Countermines will be prepared, and sprung at the proper time. Damage to the works suffered during the day will be repaired at night. *Jabots* will be removed from the foot of the breach, and when the latter has become practicable it will be obstructed by cross-fret, chevaux-de-fron, or other obstacles, and intrenchments will be thrown up to command it. If the garrison has not been overworked the assault should be repulsed.

II. The siege of an entrenched camp, defended simply by its garrison, may take the form of an enlarged *sap* of the operations described above, or of a blockade. In the former case one or two of the detached works are selected for attack, and proceeded against until their capture, the difficulties being greatly magnified by the position of the artillery of the place. The siege of Belfort (Nov., 1870, to

Feb., 1871) is an illustration. The works planned for the defense of this place were not all completed at the breaking out of the war, and some of the points selected for the detached works were occupied by field-fortifications of the semi-permanent type. These were selected by the Germans as the point of attack. The investment was completed Nov. 3, the garrison consisting of 16,000 and the attacking force of 30,000 men, increased about the middle of January to 80,000. A bombardment was opened Dec. 3, and continued night and day until Feb. 13, during which time more than 500,000 projectiles were thrown into the place. In five days nearly every house in the city had been struck. The defense, under Col. Denfert-Rochereau, was gallant and skillful. For many weeks he kept the enemy at a distance by first occupying exterior positions, and then freely using his projectiles at long range. This kept the line of investment so attenuated that the attacking force was inadequate. Moreover, the latter was compelled to throw up lines of circumvallation against the threatening force under Gen. Bourbaki, and to use part of its artillery in defending them. The detached field-works were finally evacuated Feb. 3-8, the approaches having reached the ditch. Thus, after 98 days' investment and 68 of bombardment, the attack found itself just where it would have been on the first day of the siege had it not been for these field-works. Further operations were to be pushed against the main works, but the garrison was ordered out of the place by the French Government, and turned it over to the Germans Feb. 17 and 18, Paris having capitulated Jan. 28. That a well-managed assault may sometimes be successful against an intrenched camp was proved by the capture of Kars by the Russians on the night of Nov. 17-18, 1877. The defenses consisted of twelve detached permanent forts and a citadel, all built since the Crimean war. Some of the forts were connected by lines of trenches thrown up during the war of 1877. They were manned by a full garrison of about 23,000 Turks armed with the best modern breech-loaders. The attacking force was about 35,000 men. The Turks are considered the equals of any troops in the world when fighting in a fixed position, as behind fortifications, yet this assault resulted in the killing or capture of the entire garrison, with the exception of thirty or forty men. The most prominent features of its management were that no intimation had been given to the enemy that it was contemplated, the points of attack were skillfully selected, the various columns attacked simultaneously, and a moonlit night was selected for it, when the light was sufficient to prevent confusion among the columns, though not sufficient to expose them at a distance to the view of the enemy.

III. When the intrenched camp is occupied by an army, the difficulties of forcing an entrance are greatly magnified; and if the army is not very much inferior to the attacking force, they will probably be insuperable. The method of blockade may then be resorted to, with a view to exhausting the supplies of the besieged of ammunition and provisions. Here the attack and defense consist at first of a struggle for the possession of the communications with the place. These being once all secured by the attack, their further operations consist mainly in harassing the garrison by a distant bombardment while vigilantly guarding against the introduction of supplies or re-enforcements. The defense consists in keeping up a fire upon the enemy, with occasional sorties in large bodies, the object of which is to make a permanent break in the cordon, with a view to its destruction or to cover the introduction of re-enforcements. The sieges of Atlanta and Richmond during the civil war in the U. S., and of Metz and Paris in the Franco-German war, are illustrations. In the cases of Atlanta and Richmond the operations were confined to the preliminary struggles for the communications. Having lost these, the defenders withdrew at their last opportunity, preferring the immediate loss of the place to the sacrifice of both place and troops a few weeks later. At Metz, although the army of Bazaine was driven into the fortress and kept there against its will, and weakened the fortress for resistance to blockade, nevertheless it offered an immense obstacle to a forced entrance. The general method of occupying the ground by the Germans was about the same both around Metz and Paris. A first line of outposts was established from half a mile to a mile from the works. These were intrenched, and were strong enough to resist small parties of the enemy, but not a heavy force. Behind these was a carefully selected position, forming the main line. Its distance from the works depended upon the nature of the ground, and varied from

1 to 3 miles, the normal distance being 2½ miles, or a little more than the effective range of the guns of the enemy. It was fortified by rifle-trenches and gun-emplacements of the strongest profile, strengthened by abattis or other obstacles, with occasionally an inclosed work capable of offering independent resistance. Farther to the rear central points were selected and fortified, at which the reserves were posted, and upon which the troops were to rally in case of the enemy's success in breaking through the cordon. The length of the line of investment of Metz was 24 miles, and of that at Paris 45 miles. In each case the besieging force was about 200,000 men. The holding of such lines by such numbers would have been utterly impracticable previously to the modern improvements in small-arms and the introduction of the free use of continuous lines of intrenchments. As it is, when the investment is once closed the besieging army has a great advantage over the defenders, since it can accomplish its purpose without leaving its works. The rôles are reversed, and the besieged are compelled to throw themselves against the intrenchments, where they are sure to meet with destruction. The army in Metz was 173,000 strong and that in Paris 500,000, many of the latter, however, worthless as soldiers. The former capitulated after 70 days' blockade, and the latter after 129 days'. The operations about these cities, especially Metz, give rise to the curious but essential question, Can one army invest and besiege another of equal magnitude? The object of the sorties from Metz was to break through the cordon and get away with the active army, leaving the place to be held by its garrison. The fortifications aided such attempts; and if they had been mere field-intrenchments which were being evacuated, the beleaguered army would have had still less chance of success. The answer, then, seems to be, Let an army somewhat demoralized by defeat simply lie dormant for a while, and it may be invested by equal numbers and taken by siege. The so-called siege of Plevna, July to Dec., 1877, was one of the most prominent features of the Russo-Turkish war of 1877-78. Upon its occupation by the Turkish army, about the middle of July, Plevna was without defenses. The construction of field-fortifications was continued, almost under the fire of the enemy, during the five months which followed, until there was an intrenched camp, having 47 detached works, supplemented by numerous lines of trenches, and occupying a perimeter of about 23 miles. The Russians attacked the place on July 20 with a small force—about 7,000 men—and were repulsed with a loss of more than one-third their number. They assaulted again on July 30 with 30,000 men, and were repulsed with a loss of over 7,000. They again assaulted Sept. 11, with 90,000 men, after a four days' bombardment, and were repulsed with a loss of 18,500 men. They then concluded to resort to a blockade. The investment of the place was completed Oct. 24, after a hot contest for the last communications, the Turks committing the error of allowing themselves to be shut in, instead of abandoning the place before it was too late. The line occupied by the Russians was 46 miles long, the force employed being about 110,000 men. The Turks at this time had about 40,000. Subsequent operations were limited to strengthening the defenses on both sides, with the exception of the partial assaults of Oct. 19 and Nov. 8, the object of which was to gain certain points by which the line of investment could be shortened. By Dec. 10 the Turkish commander, Osman Pasha, having consumed all of his provisions, found himself compelled to surrender or to leave his works and throw himself against the fortifications which surrounded him, in a desperate attempt to cut his way out. He chose the latter alternative, lost in the attempt 6,000 men, killed and wounded, while inflicting a loss of but 1,800 upon the enemy, and then surrendered.

The blockade may be applied to a single fortress, but its chances of success will then be less favorable, for the reason that the number of mouths in the place being comparatively small, the stock of provisions may be such as to enable it to hold out longer than the requirements of the besieger will permit.

IV. For a long period in the early history of war, when the arms employed were slings and arrows, the high and thick walls of fortresses offered insuperable obstacles to a forced entrance. Sieges then were simple blockades. At a later date mining was resorted to; ramps of earth and wood were thrown up, beginning beyond the range of an arrow, and sloping upward to the top of the wall; or the battering-ram was employed to effect a breach. The method of carrying on the operation among the Greeks and Romans

was as follows: The place was surrounded by a strong continuous intrenched line. In front of the point of attack a second gallery was established parallel to the work, composed of rows. A vine was a sort of hut on wheels, about 3 feet wide, 20 feet long, and 7 feet high, with a double-roofed roof strong enough to resist anything the besieged could throw upon it, and covered with raw hides or clay to protect it from fire. It was closed in front with wickerwork from which its name was derived with loopholes. From this parallel gallery several similar galleries were run forward, the head of each being occupied by a special vine, having an overhanging roof projecting about 10 feet in the front, under cover of which workmen leveled the ground or built up the ramp. Through these galleries the material was carried forward to fill up the ditch. When the wall was reached, the battering-ram was brought up, covered by a long foot of a construction similar to that of the vines. In great stages these attacks were supported by square wooden towers, which were either moved up to the walls on wheels or put together on the spot; in their lower stories they contained ramps; in the middle drawbridges, which could be lowered upon the walls; and in the upper stories, parapets of hides, wickerwork, or overhang to protect slingers and archers. They were sometimes as much as 150 feet high, and had from ten to twenty stories. Towers of these dimensions, however, could not be moved. The besieged endeavored to secure a commanding position. When the ramp rose, they raised the wall opposite to it; and when the towers were constructed, they increased the height of those on the ramparts. They opposed the enemy's works by mining and inundations and by fire.

The invention of gunpowder rendered the wooden approaches and the towers useless, and the vines were at once replaced by trenches. The change in the character of fortification (see FORTIFICATION) rendered the defense a more active one. The garrison could rally and easily envelop the head of the approach. If an outwork were taken, it was difficult to hold it, for the reason that the supports were at a distance, and the siege of Vicksburg an outwork was taken and retaken three or four times. During the youth of Vauban the approaches were generally pushed forward to the place when the covered way was assaulted. A covered descent was then made into the ditch, and a breach was made by the mines. This also was assaulted. After the capture of the outworks the main work was breached and assaulted, and then the interior retrenchments. These operations were bloody and protracted. Vauban rendered them sure and comparatively safe. He secured his approaches from being surprised by the introduction of parallels, and, avoiding assaults, accomplished his purpose by well-directed manual labor, establishing the method sketched at the beginning of this paper.

The principal sieges during the civil war in the U. S. were as follows: At Yorktown, Va. (Apr. and May, 1862), a parallel was constructed about a mile from the works, and many batteries were established, but the enemy evacuated before the latter opened fire. This siege is interesting from the fact that it was the first struggle of earthwork against earthwork in that war. At Vicksburg the investment was closed May 19, 1863, and an assault was made and repulsed in the afternoon of the same day. A vigorous assault on the 22d, having failed, it was determined to make gradual approaches. There were no engineer troops in the command and only four regular engineer officers. Every graduate of the Military Academy below the grade of general was detailed for engineer service; practical miners were selected from the different regiments for mining; and the sapping, fabrication of gabions, fascines, etc., were executed by some pioneer companies and by details from the line. The artillery was simply the field-artillery of the army and a heavy battery borrowed from the navy. There being no light mortars, wooden mortars were made by shrinking iron hoops upon cylinders of hough wood and boring them out for 6 or 12 lb. shells. The broken nature of the ground gave ample protection to the attack up to within 600 yards, and often to within 400 yards of the works. By June 30 there were 350 guns in position. A line of circumvallation was thrown up to oppose the efforts of Gen. Johnston to relieve the place. On June 25 a heavy mine was sprung under one of the salients. The crater was assaulted and occupied, but the besieged, having been warned, had prepared an inner line, to which they retired. Another mine was at once begun, which was sprung July 1, blowing up an entire redan, with its defenders; but the interior line

was not destroyed, and no assault was made. The besieged attempted to obstruct the advances by countermining, but obtained only slight success. Occasional sorties were also made, and at one point 90 yards of trench were run out as a counter-approach. By July the approaches had in many places reached the ditch. Orders were given to prepare the heads of approaches for the easy defense of troops; to widen the main approaches so that men could easily move by fours, and to prepare planks and sandbags for crossing the ditches. On July 4 the place capitulated, with over 30,000 men. In the operations against Richmond in 1864 it was found necessary to occupy Petersburg. Desperate assaults were made June 15, 16, 17, and 18, but only an outer line of intrenchments could be taken. A mining-gallery was begun June 25, and a regular siege was determined upon July 9, and work began July 11. Gradual approaches were attempted, but the difficulties of pushing them against a long line of strong works, which could not be enveloped and were defended by forces nearly equal to the attack, were found to be so great as to offer small chance of success. The mine was sprung July 30, the main gallery being 510 feet long, and its two branches 37 and 38 feet respectively, and the charge 8,000 lb. of powder. It was followed by a badly managed assault, which failed. Gradual approaches were abandoned, and steps were taken to prepare the lines of investment to be held by a small force, with a view to moving the main body upon the communications which were still held by the enemy. The latter operations gradually extended the lines until in October their length was 52 miles, comprising thirty-six forts and fifty batteries. The system consisted of inclosed fieldworks placed in commanding positions at intervals of about 600 yards, connected by strong rifle-trenches, well protected by obstacles in front. Many of the inclosed works were provided with loopholes in addition to the magazines, etc. In some parts small redoubts were placed 300 or 400 yards in advance of the main line, to insure time for manning the latter in case of assault, the ordinary pickets not being deemed sufficient. The line extended from the Appomattox, southerly and westerly, embracing two sides of Petersburg, and thence back as a line of circumvallation to the James river, thus enclosing the Army of the Potomac in a loop. The movements of the forces operating upon the communications finally rendered an assault practicable by drawing a large part of the defenders away from their works. It was given Apr. 2, 1865, and a large part of the works were captured, the defenders evacuating the city during the night which followed. The fall of Petersburg necessitated the evacuation of Richmond. In the pursuit which followed, the whole Confederate army of Northern Virginia was captured. Mention may be made of the sieges of Fort Polk (q. v.); Corinth, Miss., May, 1862; Port Hudson, La., May, 1863; Fort Gaines and Morgan, Mobile, Ala., Aug., 1864; and Fort Blakely and Spanish Fort, Mobile, Ala., Apr., 1865. See BOWMAN-CRENSHAW.

Siegfried: See NIBELUNGENLIED.

Siemens, ERNST WERNER, von: electrician; b. at Lenthe, near Hannover, Dec. 13, 1816; was educated in the gymnasium of Lubeck and in the school of artillery and engineering at Berlin; entered the Prussian army as an officer of artillery in 1838; studied chemistry and electro-magnetism; took out a patent for electro-plating and gilding in 1841, and laid in 1848 the first submarine mines exploded by electricity; left the army in 1849, and founded in connection with Halske, a telegraph-building establishment in Berlin, which built the telegraph lines of Russia, Spain, Brazil, Northern Germany, etc. Among the many inventions and improvements which are due to him, and of which he gave an account in *Proceedings of the Berlin Academy, Poggendorfs Annalen*, etc., are the methods of determining the position of injuries in submarine and submarine lines, of examining insulated wires, of shunting subterranean and submarine conductors in order to lessen the disturbing influences of induced currents in the cables. D. in Berlin, Dec. 6, 1892.—His brother, Sir WILLIAM (Karl Wilhelm) SIEMENS, physicist, b. at Lenthe, Apr. 4, 1823, was educated at Göttingen; settled in 1848 in London as a civil engineer, and founded there in 1854 a branch of the Berlin house, with immense telegraph-building establishments at Woolwich and extensive steel-works at Landore in Wales. He invented the regenerative furnace (see FURNACE), in which he utilized the heat which would otherwise escape, the bathometer, an instrument for measuring ocean-depths,

a pyrometer, etc.; and published *On a Regenerative Condenser* (1850); *On the Conversion of Heat into Mechanical Effects* (1853); *On a Regenerative Steam-engine* (1856); and *On the Increase of Electrical Resistance in Conductors, with Rise of Temperature, and its Application to the Measure of Ordinary and Furnace Temperatures* (1871). He was knighted Apr., 1883, and died Nov. 20 the same year. See his *Life* by W. Pole (London, 1889).

Siemens's Armature: See ELECTRIC MOTOR.

Siemens's Regulator: See ELECTRIC LIGHTING.

Sienna, sē-ā-nā, GUIDO, da: painter; b. at Sienna, Italy, about 1200. A picture of his dated 1221 still exists. He was one of the first Italian painters to break away from Byzantine traditions, and is the artist who confirms the priority of the Siennese school to the Florentine. He did not paint in fresco, but on panel. His best-known picture, a Virgin holding the Divine Child on her knees, is in the Dominican church at Sienna. Another Madonna, dated 1262, at San Bernardino is supposed to be by this artist. W. J. S.

Sienna [It. *terra di Siena*, earth of Sienna]: an ochreous earth which when ground forms an excellent pigment called raw sienna, and when burnt assumes a still richer orange-red tint. It is brought from Italy.

Sienna (Ital. *Siena*, anc. *Sena Julia*): city of Tuscany, Italy; chief town of the province of Sienna; covering a beautiful hill 1,100 feet above the sea, a spur of the Chianti chain; in lat. 43° 22' N., lon. 11° 11' E.; 60 miles by rail S. of Florence (see map of Italy, ref. 4-D). The walls are about 4 miles in circumference; the citadel occupies the northwest corner of the town, which is entered by nine gates; and the principal streets radiate in irregular lines from the Piazza Vittorio Emanuele, a fine large open space nearly in the heart of the city. The Duomo, or Chiesa Metropolitana, one of the finest specimens of Gothic architecture in Italy, stands on an elevation not far from the center of the town. Its length is about 300 feet, its mean width 120 feet. The western façade is magnificent in color and in the richness of its sculptures. The effect of the interior is peculiarly picturesque, partly from the horizontal layers of black and white marble of which not only the walls but even the columns are composed, and partly from the roofing, which is a vault of blue studded with stars. The pavement is of marble inlaid in various styles, the work of different artists from the fourteenth to the sixteenth century, the most distinguished of these being Beccafumi (1517). The marble pulpit is adorned with some of the finest reliefs of Nicola Pisano and his school. The bronze tabernacle, the pictures by Duccio (1300), several early works of Michelangelo, the celebrated frescoes of Pinturicchio (1502) representing scenes from the life of Pius II., the fountains, the vases for holy water, the large collection of old choir-books exquisitely adorned with miniatures, are among the countless other objects of the highest interest to the student of art. In the Church of S. Agostino and in several others, in the ex-convent of S. Domenico, and in many private palaces are choice pictures by early painters, above all by Sodoma. The Academy of Fine Arts is very rich, especially in pictures of the Siennese school. The university, founded in 1321, was formerly very celebrated. There are cloth and furniture factories, but the industries are small.

As early as the reign of Charlemagne Sienna was governed by a count. In the disputes between the papacy and the German emperors it at first took the side of the former, and like its neighbors, Florence and Pisa, developed into an independent commonwealth. In 1186 Sienna joined the other large Tuscan commonwealths in their resistance to Henry, son of Frederic Barbarossa, but after some successes was reconciled to the emperor, and thenceforward it continued, for the most part, steadfastly Ghibelline. In 1260 the Siennese inflicted a crushing defeat on the Florentines at Montapert, but hostilities were frequently renewed afterward. An awful plague, known as the black death, broke out in 1348, and continued to appear until toward the close of the century. During the first year of this frightful malady 80,000 persons are said to have perished in the city and territory of Sienna. In 1480 the government of the commonwealth fell into the hands of Pandolfo Petrucci, who continued to direct public affairs successfully until 1512. After his death the Medici, with Spanish help, annexed Sienna to the territory of Florence. From this time its history is almost one with that of the rest of Tuscany. Pop. (1893) 29,000.

Sierra: See MOUNTAIN.

Sierra Leone, si-ār'raā-lē-ō-nē: a British colony on the northern end of the Guinea coast, Africa, from 7° to 9° N. lat., including about 150 miles of coast and extending 100 miles inland. Area about 15,000 sq. miles. The soil is fertile, especially in the low coast-land, but the climate is extremely hot and unhealthful, especially in the wet season. The rainfall at Freetown is about 110 inches, of which two-thirds fall in July, August, and September. All tropical plants and fruits grow luxuriantly, and palm oil, pepper, ginger, gum-copal, ground-nuts, etc., are exported. Sugar, coffee, indigo, and cotton have been introduced, and succeed well. The settlement was made in 1787 with a philanthropic purpose, the idea being to form a home, or at least a place of refuge, for free Negroes, and in spite of its climate, which is very unhealthful for Europeans, the colony is steadily growing. The chief products and exports are palm oil, palm-kernels, benni-seeds, ground-nuts, kola-nuts, India-rubber, coal, and hides. The capital and chief port of the coast is Freetown, which is fortified and is a naval coaling-station. Pop. (1893) 180,000, with 224 whites. Administration is actually effective over only about 75,000 of the population.

Revised by M. W. HARRINGTON.

Sierra Madre, -mā-drā', or Sierra Madre del Pacifico: the irregular chain of mountains which borders and frames the western side of the Mexican plateau. (See Mexico.) It may be regarded as a continuation of the mountains on the western border of the Great Salt Lake basin, and the name Sierra Madre is applied to it also in Southern Arizona. Entering Mexico near lon. 109° W. it separates Chihuahua from Sonora, occupies the western part of Durango, and is continued through Jalisco. On the eastern or plateau side the declivity is gentle, but the Pacific side is marked by steep slopes, numerous precipices, and magnificent scenery. Few of the peaks exceed 10,000 feet. The chain is much broken, and often there are several parallel ranges. In Jalisco, especially, the mountains are cut by deep cañons where rivers break through them. The higher slopes are covered with pine-forests. The Sierra Madre del Sur, in Southern Mexico (Guerrero, Oajaca), is an E. and W. range, parallel to and near the Pacific, and rising in parts to 10,000 feet; apparently it has no structural connection with the Sierra Madre del Pacifico. The mountains forming the eastern border of the plateau are sometimes called, collectively, the Sierra Madre del Oriente or Eastern Sierra Madre.

HERBERT H. SMITH.

Sierra Morena, -mō-rā-nā: a mountain range of Spain, separating the basin of the Guadiana from that of the Guadalquivir, and extending between lon. 3° and 4° W. Its aspect is generally rugged and somber; its highest peak is Aracena, about 5,500 feet high.

Sierra Neva'da [Span., snowy mountains: *sierra*, saw, mountain range < Lat. *serra* + *neva'do*, snowy, deriv. of *nieve*, snow < Lat. *nix*, *nivis*]: a mountain range of Southern Spain, 75 miles long and 25 broad, between the Guadalquivir and the Mediterranean. Its highest peaks are Mulhacen, 11,658 feet, and Veleta, 11,387 feet, and it has received its name from its being covered on many of its peaks with perpetual snow and ice. Its southern slopes are clad with chestnut forests, olive and orange groves, and vineyards.

Sierra Nevada: a mountain range of Eastern California, separating the great valley of California from the interior basin of Nevada. The general trend is N. N. W. The range is continued at the N. by the Cascade Mountains, and at the S. turns S. W., uniting with the Coast Ranges. It is essentially a broad plateau inclined toward the W. except at the extreme N., where it divides into several ridges. The crest-line and highest peaks are along the eastern margin, and the eastern slope is steep. The long western slope is broken by deep cañons. Among its highest peaks are Dana (12,992), Lyell (13,042), Brewer (13,886), Tyndall (14,386), and Whitney (14,898), the loftiest point of the U. S. south of Alaska. The principal passes are Tehachapi (3,830), crossed by the Southern Pacific Railroad, Walker (5,320), Truckee (7,200), crossed by the Central Pacific Railroad, and Beckworth (5,190). The snowfall on the western slope is heavy, and the rivers nourished by its melting irrigate the Californian valley. The eastern slope is characterized by the arid climate of the interior basin. Among the higher peaks are a few small glaciers.

Sprachen* (1878); *Hilfsmittel* (1878); *Angelsächsische Grammatik* (1881); 2d ed. 1898; *Kurz, sprachl.; Proben einer kritischen Herleitung des Eddaliedes* (1895); *Tübinger Beischläge der altgerm. Prosodie* (1896); *Einleitung zum Hildesheimischen* (1897); *Altdeutschische Hymnen* (with E. Steinmeyer, 1876-82); *Allgemeine Metrik* (1892). He has been *Lehrer* since 1891 at *Beiträge zur Geschichte der deutschen Sprache und Literatur*. BIRTH, LIE WIEGERS.

SIEYES, ABBÉ, DOMINIQUE JOSEPH (commonly known as the ABBIÉ SIEYÈS); politician and statesman; b. at Fréjus, department of Var, France, May 3, 1749; was educated for the Church at the seminary of St. Sulpice, Paris; took orders and became vicar-general and chancellor in the Bishop of Chartres in 1784. He had attained some reputation as an acute thinker when suddenly, in Jan., 1789, he attracted the attention of the French people by his celebrated pamphlet, *Quel est que le Tiers-Etat?* and having been elected a member of the States-General by Paris, he became for some time the actual leader of the Assembly and originated some of the first and most decisive steps toward the Revolution. He proposed that the three estates should examine their credentials in common, that the third estate should constitute itself a national assembly, &c.; and his pamphlet, *Reconnaitre et Représenter des Droits de l'Homme et du Citoyen* (July, 1789), was the precursor and immediate occasion of the declaration of the rights of man. The new administrative division of France into departments and the abolition of the old provincial system, with its many feudal remnants and artificial barriers, were also due to him. Nevertheless, as the Revolution ceased to be a philosophy and became a passion, Abbé Sieyès lost his influence. In the Convention he sat silent, though he voted for the death of Louis XVI. without any appeal to the people; and during the Reign of Terror he entirely disappeared from public life. After the fall of Robespierre he returned, was successfully employed in several diplomatic negotiations, and became a member of the Directory May 15, 1799; and it was he, as much as if not more than Gen. Bonaparte, who prepared and carried through the *coup d'état* of the 18th Brumaire (Nov. 9, 1799), at which the Directory was overthrown and the consular government instituted, he himself being chosen one of the three consuls. Very soon, however, finding that this, the last beloved of the various constitutions which he had framed, was discredited, and that he had in effect brought on a military despotism with Napoleon as First Consul in complete control, he retired from his consulship and took part very little in politics. Napoleon enriched him and made him a count of the empire. After the Restoration, Sieyès was banished from France as a royalist, and went to Brussels. After the Revolution of 1830 he returned to Paris, and died there June 20, 1836. Boslay published, in 1898, *Œuvres constitutionnelles de Sieyès*, drawn from his *Mémoires inédites*. There are also *Études Sieyès*, by Mignet (1839) and *Nouveaux* (1851). Revised by P. M. COLBY.

SIGEL, JOSEF (PRANK); soldier; b. at Sinsheim, Baden, Nov. 28, 1824; graduated in the military school at Karlsruhe; became a lieutenant of infantry in the army of the Grand Duke of Baden; resigned in 1847 from political reasons; he took part in the revolutionary movement of 1848; led a corps of 4,000 men through the Black Forest to the attack of Pforzheim, and, narrowly escaping capture, he fled to Switzerland. At the beginning of the insurrection of 1849 he was appointed Minister of War by the revolutionary authorities; took part in the unsuccessful campaign against the Prussians, and after fighting several battles, including Kessel, he successfully conducted the demoralized rem-

nants of his troops into Switzerland on the dissolution of the provisional government, but, being expelled by the Swiss Government, he went to England, and after remaining there two years he embarked for the U. S.; was for some years teacher of mathematics in an academy in New York, and became major of the Fifth Regiment of New York militia, settled in St. Louis, Mo., 1858, as professor in a college; was commissioned early in 1861 colonel of the Third Missouri volunteers; took part in the capture of Camp Jackson; fought the desperate battle of Carthage July 3; was second in command under Lyon at Wilson's Creek Aug. 10; conducted the retreat from Springfield to Rolla; was then appointed brigadier-general; in date from May 17; commanded a division under Fremont in his campaign in Southern Missouri; took an active part in the battle of Cow Ridge Mar. 6-8, 1862; tendered his resignation in May, in consequence of unpleasant relations with Gen. Halleck, in command of the district; was summoned to Washington and made major-general, dating from May 21; was placed in command of Harper's Ferry June 2; succeeded to the command of Gen. Fremont's army June 26; served under Pope in the Virginia campaign, taking a prominent part in the second battle of Bull Run Aug. 30-31; was placed in command of the Eleventh Army Corps Sept. 14, 1862; became commander of the department of West Virginia Mar., 1864; was defeated by Ricketts at Newmarket May 16; relieved from command shortly afterward by Gen. Hunter; resigned May 4, 1865, and became editor of the *Baltimore Worker*; returned in 1867 to New York, where he was chosen register Nov., 1871. He was U. S. pension agent for New York 1885-88. Revised by JAMES MEMORA.

Sighing: an act consisting of a full, long, and slow inspiration, which is immediately followed by a more rapid expiration unusually prolonged, and characterized by the presence of a sound as air passes out of the mouth. Although usually a reflex act, presumably excited by an almost imperceptible sensation due to imperfect secretion of the blood, sighing is often voluntarily performed, although it is in some respects not a perfect counterpart of that which is produced reflexly. It ordinarily takes place about once in every six respirations, but when the attention is concentrated upon some subject of great interest, the reflex excitability is diminished for the time being, and then, when the mind becomes disengaged, the act of sighing is so prominent as to attract at once not only the notice of the individual, but of those around him. The apparent object of sighing is to aerate the blood more perfectly than ordinary respiration, and through it the lungs are more effectually filled and emptied than would be the case were the breathing uniformly regular. Sighing is also a means of expressing certain emotions, particularly those of a sorrowful and tender character. In this relation it is to a certain extent under the operation of the will, and may be assumed, like smiles and tears, for purposes of deception. Figuratively, the act of sighing is often associated in our minds with desires, and we are said to sigh for the objects of our wishes; but the connection is in reality not primary. We sigh not because we desire anything, but because during the concentration of the mind upon a subject or object of engrossing interest we are for the time incapable of appreciating the sensation which prompts us to inspire air until it becomes overwhelming, and then the long-drawn sigh takes place. Sighing is not peculiar to the human species, but is a normal phenomenon of respiration in all mammals, and perhaps in other classes of animals. Revised by K. T. RAVENHILL.

Sigillaria [Mod. Lat., from Lat. *sigillum*, seal. Named in reference to the scars left by the leaf-stalks]; a genus of fossil trees of the Carboniferous period. Trunks have been found 5 feet in diameter and 70 feet long. The roots called *Sigillaria* belong, at least in some instances, to this genus. See PLANTS, FOSSIL (*Lycopodiaceae*).

Sigillum Confessionis: See CONFESSION.

Sigismund: Emperor of Germany 1411-37; the last of the house of Luxemburg; b. Feb. 14, 1368; a son of the Emperor Charles IV.; received after his father's death (1378) the margraviate of Brandenburg, while his elder brother, Wenceslaus, King of Bohemia, succeeded as emperor. Having been betrothed to Maria, the eldest daughter of Louis the Great, King of Hungary and Poland, he became heir-apparent to these two crowns. But on the death of

Louis (1388) the Poles chose his younger daughter, Hedvig, queen, Charles Durazzo seized the regency in Hungary, and Maria was kept in captivity by John Horvath, ban of Croatia. Sigismund rescued and married her, and was crowned King of Hungary in 1387. He then undertook a war against the Turks, supported by the German and French chivalry, but was completely routed at Nicopolis (1396) by Bajazet, fled to Greece, and found, when in 1401 he returned to Hungary, his queen dead, his throne occupied by Ladislaus of Naples, and his brother deposed in Germany, and vindicating himself only with difficulty in Bohemia. In 1403 he expelled Ladislaus, and again took possession of the throne of Hungary, and in 1410 was even elected Emperor of Germany. In 1414 an oecumenical council was convoked at Constance in order to put an end to the schisms in the Church, and reconcile the Hussite party. He gave his assent to the decree of the council condemning Huss to be burned at the stake; and the Hussite war began. D. at Znaim, Moravia, Dec. 9, 1437. He was succeeded by his son-in-law, Albert II. of Hapsburg.

Sigismund: the name of three kings of Poland of the Jagellonian dynasty: SIGISMUND I., THE GREAT, b. in 1466, a son of Casimir IV., succeeded his brother Alexander on the Polish throne in 1507. His was probably the most successful reign in the history of Poland. A treaty with the Turks gave Poland the free navigation of the Black Sea, the sovereignty of Moldavia, and secured her against the invasions of the Mongols. He knew how to curb the arrogant nobility; was prudent in his expenses, and a patron of literature, which flourished highly under him and his son; and he favored the Reformation, which from Germany spread rapidly among the Poles. After the death of his first wife, Barbara Zapolska, he married Bona Sforza of Milan, an intriguing, avaricious, and licentious woman, who exercised great influence over him, and alienated to some extent the love of his subjects from him. D. Apr. 1, 1548, and was succeeded by his son, SIGISMUND II., AUGUSTUS, b. Aug. 1, 1520, who, although educated purposely by his mother in effeminacy and dissoluteness, opposed the ambitious schemes of the queen-dowager with great decision. At the Diet of Lublin (1569) Sigismund succeeded in uniting Lithuania firmly to Poland, and at the Diet of Warsaw (1572) he granted religious liberty, but the intolerance of the nobles prevented anything like freedom of worship to the serfs. Volhynia, the Ukraine, and Livonia were also incorporated, and his reign was, in both external and internal respects, a period of great prosperity. D. July 14, 1572, and with him the male line of the Jagellonian dynasty became extinct. His sister Catharine, however, who was married to John III., King of Sweden, had a son, Sigismund, who was elected King of Poland as SIGISMUND III. after the death of Stephen Báthori (1587), and was crowned at Cracow; but his only aim was to unite Sweden and Poland, in order to re-establish Roman Catholicism in the former and suppress the Reformation in the latter. In 1592 John III. died, and Sigismund succeeded him as King of Sweden, but in 1604 he was formally deposed by the Swedish estates, and his uncle, Charles IX., raised to the throne. Unwilling to give up his claims, he then began a long series of wars with Sweden which contributed much to the final ruin of Poland. D. at Warsaw, Apr. 30, 1632.

Sigmaringen: See HOENZOLLERN.

Sign [viâ O. Fr. from Lat. *signum*, mark, sign, token; cf. SEAL]: in astronomy, a portion of the ecliptic, containing a twelfth part of the complete circle, or thirty degrees. The first sign begins at the point of the equator through which the sun passes at the time of the vernal equinox in the upper hemisphere; and the signs are counted onward, proceeding from W. to E., according to the annual course of the sun around the circle. The signs and their characters are as follows:

♈, Aries, Ram.	} Spring.	♎, Libra, Balance.	} Autumn.
♉, Taurus, Bull.		♏, Scorpio, Scorpion.	
♊, Gemini, Twins.		♐, Sagittarius, Archer.	
♋, Cancer, Crab.	} Summer.	♑, Capricornus, Goat.	} Winter.
♌, Leo, Lion.		♒, Aquarius, Waterman.	
♍, Virgo, Virgin.		♓, Pisces, Fishes.	

The first character, ♈, indicates the horns of a ram; ♉, the head and horns of a bull; ♊, the ancient statues of Castor and Pollux; ♋, the claws of a crab; ♌, a corruption of the Greek letter Λ, initial of *Λέων*, lion; ♍, corruption of *ῥαπ* for *ῥαπίδες*, virgin; ♎, scales; ♏, the tail of a scorpion, or the legs and tail; ♐, an arrow; ♑, for *τρ*, initials of *τράγος*, goat; ♒, running water; ♓, two fishes joined. See ZODIAC.

Sign: in algebra, a symbol indicating a relation subsisting between two quantities, or an operation to be performed. Of the latter, those most commonly used are +, denoting addition; −, subtraction; ×, multiplication; ÷, division; √, square root; ∛, cube root; and $\sqrt[n]{}$, *n*th root. The signs denoting relations are =, equal to; >, greater than; <, less than, etc.

Signaling: a means of transmitting intelligence to a distance by means of signals appealing to the sense of sight or of hearing. For army signaling, especially in the U. S., see SIGNAL SERVICE and HELIOTROPE, and for signaling at sea see the former article and FOG-SIGNALS, NAVAL SIGNALS, and ROAD, LAW OR RULE OF THE. Signaling is of great importance on railways, for which see RAILWAYS (*Signals and Interlocking*). Signals are also used to make announcements of weather predictions. (See WEATHER SIGNALS.) For the signals used before the invention of the electric telegraph to transmit messages to a great distance, see TELEGRAPH.

Signal Service: that branch of the public service of a country which is concerned with transmitting intelligence by means of signals, especially in the army and navy. Few persons without experience have any idea of the remarkable ranges at which signals made by motions are visible to the naked eye, or the wonderful gain had by the use of a simple pocket-telescope. Signaling at 5 miles is held by experienced signalists to be at very short range. Messages have been sent 10 miles by means of a pocket-handkerchief attached to a 12-foot rod. With the flags and staffs in use in the Signal Corps of the U. S. army communication is said to have been had at 25 miles' distance, and detached words are reported to have been read at a distance of 40 miles.

It is well known that the success of modern military operations depends very largely upon celerity of movement and the concentration of the largest force at a given point. The greatly increased accuracy and range of small-arms and artillery have made it imperatively necessary that there should be rapid and sure means of intercommunication between the various component parts of an army, and that there must be prompt transmission of information both on the march and on the field of battle. The conditions necessary to meet these requirements are well provided for by the Signal Corps of the U. S. army as at present organized. The system of military signals of which Maj. Albert J. Myer was the originator proved to be a great advance over the crude and unwieldy methods previously in use. Its value was speedily demonstrated by actual test almost immediately after the appointment of Myer as first signal officer of the army in 1860, and at the close of the civil war its usefulness as an auxiliary arm on the field of battle and on the march was not only recognized by giving it a place in the permanent military establishment, but the record which the corps made during the war has been utilized by the military powers, and the Myer system serves as a basis upon which rests modern military signaling. In Aug., 1861, a camp was formed at Georgetown, D. C., where signal-parties were instructed and equipped to attend each army that took the field; but it was not until Mar. 3, 1863, that the Signal Corps was given a separate and systematic organization. It was to consist of 1 colonel, 1 lieutenant-colonel, 2 majors, 1 captain, and 8 lieutenants for each army-corps, and for each officer there was allowed a sergeant and 6 privates. The corps was authorized for the duration of the civil war, and appointments were to be made on the recommendation of examining boards.

The Signal Corps served with the greatest efficiency on all fields during the civil war, and even on naval vessels, notably with Farragut in the fight at Mobile Bay. At the close of the war it was again reorganized. The act of July 28, 1866, provides that there should be one chief signal officer, with the rank of colonel, but it made no provision for a corps other than by a limited detail of six officers and not to exceed 100 men from the Engineer battalion. The school of instruction was established at Fort Whipple, now Fort Myer, Virginia, and here for many years signal instruction was given to officers of the army and the navy and to the enlisted men of the Signal Corps. In 1870 a meteorological division was added to the signal service, to provide for taking meteorological observations, with a view to giving notice by telegraph and signals of the approach and force of storms, and for twenty-one years this work formed a most important part of the duties of the service, gaining for it a worldwide reputation by the skill with which its weather forecasts were produced and their great reliability.

On July 1, 1901, however, that branch of the service was constituted the weather bureau and transferred to the Department of Agriculture. See WEATHER SIGNALS.

The signal corps of the U. S. army is constituted under a law which took effect July 1, 1901, and which provides that in addition to the chief signal officer (who has the rank of brigadier-general), the commissioned force shall consist of 1 major, 4 captains, and 4 first lieutenants, who shall receive the pay and allowances of mounted officers of like grades in the army. The enlisted force of the Signal Corps of the army shall consist of 60 sergeants, of which ten shall be of the first class, with the pay of hospital stewards. In time of war the ten officers and fifty enlisted men would have to be largely supplemented from the army, in order to man the various appliances that constitute its equipment, the present number having already been found too small. At present a number of the sergeants are employed as operators on the military telegraph lines throughout the republic and at the various department headquarters, and the rest are at the School of Instruction for Military Signaling at Fort Riley, Kansas.

This course of instruction extends over six months, and consists of both theoretical and practical instruction in the general principles of signaling, and requires a thorough knowledge of all the codes likely to be used in active service, including the international and nautical codes used by the U. S. navy, thus assuring, when necessary, signal communication between the land and naval forces and merchant marine. Instruction is also given in cryptography, and the class is required to devise plans of cipher and by practice to become skilled in enciphering and deciphering messages. Theoretical and practical instruction is also given in electricity, topography, photography, and the operation of the field telegraph and captive balloon trains. Practice in signaling extends over various ranges up to 12 miles with the flag, torch, and flash-lantern, and with the field-telegraph kit, both insulated cable and the bare-wire system being used. The course of instruction to operators consists largely in practice with the Morse system until each of the sergeants can send and receive thirty-five words a minute, and transcribe twenty-five words a minute on the typewriter, together with the regulations for transmission of messages and keeping the accounts of the various military lines, in which a considerable amount of commercial work is done.

The means of communication by day used by the corps are flags, heliograph, and the field telegraph and telephone trains; and by night the torch, flash-lantern, rockets, bombs, and searchlight. The method of visual signaling by flags consists in waving a flag to the right for a dot, to the left for a dash, and to the front for the space in the American Morse code. Thus the motions

Right, right, front, right represent C.
Right, front, right represent O.
Right, front, right, right represent R.
Right, right, front, right, right represent Y.
Right, right, right, front, right represent Z.
Right, front, right, right, right represent &.

Each motion embraces an arc of ninety degrees, starting from and returning to the vertical. The long dash (letter

The U. S. naval code for visual and telegraphic signaling uses three signals, numbered 1, 2, and 3, by combinations of which all the letters and numerals are expressed. In flag-signaling 1 is made by a motion to the right, 2 by one to the left, and 3 by one to the front (see figures), with a whistle or flashlight 1 is one long or short flash, 2 two dots or short flashes, and 3 a dash or long flash. The alphabet and numerals are as follows:

A 22, B 2112, C 121, D 222, E 12, F 2221, G 2211, H 122, I 1, J 1122, K 2121, L 221, M 1221, N 11, O 121, P 1212, Q 1211, R 211, S 212, T 2, U 112, V 1222, W 121, X 2122, Y 111, Z 2222. 1-1111, 2-2222, 3-1112, 4-2221, 5-1122, 6-2211, 7-1222, 8-2111, 9-1221, 0-2112.

FIG. 2.—Second motion—"two" "Two-one"—"21"—("—")—"2" or dash ("—").

When signals are communicated in the presence of the enemy they must be transmitted in cipher. The composition of cipher codes is facilitated by the use of a simple device called the cipher disk (see Fig. 4). This consists of several concentric disks, each carrying letters of the alphabet or numbers arranged in irregular sequence. To encipher a message the disk is clamped in any desired position, and the letters or symbols on one of the outer disks are used, each standing for the letter opposite it on the inner disk.

The field-telegraph train used in the U. S. army consists of a battery wagon and three sections, each of which includes a lance-truck and a wire-wagon.

The Japanese Signal and Telegraph Corps, the day following the battle of Ping Yang, in Korea, 1894, ran into that city a flying telegraph line extending from Seoul, the distance being 70 miles. This shows what modern war requires, and the necessity of a specially trained corps for these purposes.

The balloon-train is another factor of the utmost value in modern war tactics. The ability to discover the movements and position of an enemy is an absolute necessity, and these can be accurately ascertained by an operator in a balloon about 2,500 or 3,000 feet above the surface of the earth, who can scan the country for miles around with a good telescope, and telephone at once whatever he may see to the surface of the earth. The balloon-train at Fort Riley consists of three wagons for the carriage of tubes of compressed hydrogen and one wagon for the balloon and appliances.

When the balloon is inflated the manœuvring-bar is at-

FIG. 1.—First position. First motion—"one"—"1" or dot ("·").

"1," and numeral "naught") is distinguished from the "T" dash by a slight pause at the lowest point of dip, and with this exception there is no pause whatever between the motions required for any single letter. A slight pause is made between letters. At the end of each word, abbreviation, or conventional signal the space signal, or "front" motion, is made, (vertical) and followed by a pause equivalent to that made between letters.

FIG. 3.—"One-two-one-two" "Three"—"3"—or "front,"—"1212"—("—").

tached to the end of the cable on the drum of the balloon-wagon, and the necessary amount of cable is paid out. The height of the balloon above the ground is of course regulated by the length of cable paid out, and the observer in the car, having a field telephone kit, can direct the manipulation of the balloon itself as occasion may require.

The equipment of the car consists of an aneroid barometer, prismatic compass, telescope, field-glasses, note-book and pencil, telephone, maps of the country, and a camera. The operator is thus fully prepared for photographic work and observation. It may be thought that a balloon would present a good target to the enemy, but the experiments at Shoeburyness with an old captive balloon showed that it is almost impossible to hit such an object with long-range musketry fire or by artillery fire, especially if it be kept moving, which it always would be.

The advantage that a force possessing a balloon-train has over a less-favored enemy is manifest. All the great nations have equipped their armies with captive balloon-trains,

FIG. 4.—Cipher disk.

Vertical section exhibiting plan for four disks.

and the individual processes of manipulation are regarded as military secrets. The French claim to possess a dirigible balloon, and if its practicability be established the machine should prove a most powerful engine of war.

It will be seen from the foregoing that the system of signaling used in the U. S. army—which is practically the invention of one man, Gen. A. J. Myer—has developed into a military science. In most of the foreign armies the signal service has been dignified by a separate corps organization, and where not separately organized they form a distinct division of some corps already in existence, such as the engineer, and the practical exigencies of war have in war served to make them independent in all but name. In Great Britain the signaling operations are entirely under the jurisdiction of the Royal Engineers Telegraph Corps, which consists of 6 officers and 245 men. In the Austrian army this duty is performed by a regiment having charge of railways and telegraph. In the Russian army there are 7 field-telegraph boards, each board consisting of 3 divisions, with the strength of 1 officer and 38 men. In the German army there are 7 field and 4 semi-permanent telegraph divisions, each field division being composed of 4 officers and 148 men. Belgium, Holland, Spain, and Italy have all given special attention to the organization of telegraph and signal trains in connection with their military establishments.

In addition to the military telegraph lines under charge of the chief signal officer of the U. S. army, there are thirty-three military posts and stations whose telegraphic connections with the great commercial systems of the U. S. are over prominent lines, constructed and operated by the Signal Corps of the army. There is at present hardly a military post which has not a telegraph station either within its limits or at some convenient point speedy of access. In addition to the regular telegraph service attention is being given to suitable equipment of its flying telegraph-trains in all phases, from the connection, by means of such lines, of army headquarters with the permanent lines of the U. S., to the provision for temporary telegraphic or telephonic communication between army, division, or even brigade headquarters, with all essential points, whether in camp or on battle-line.

H. H. C. DUNWOODY.

Signature: in the old system of medicine, some physical peculiarity of a drug which was supposed to indicate its

use. Thus, because the euphrasy or eye-bright has a flower with an eye-like mark, it is good for the vision; the rock-liverwort was thought to be shaped like the liver, hence it is good for diseases of that organ. This belief prevailed not only among herbalists and pretenders, but among the best-trained physicians of the time.

Sign-language: See DEAF-MUTES.

Signorelli, scèn-yō-rel' lée, LUCA: painter; b. at Cortona, Italy, about 1441; pupil of Piero della Francesca. In 1472 he was painting at Arezzo, in 1474 in Città di Castello. He afterward went to Rome, and in the Sistine chapel painted two frescoes representing incidents in the history of Moses. These were completed by 1484, when he returned to Cortona, and painted an altarpiece for the chapel of Sant' Onofrio in the Cathedral of Perugia. In 1490 he painted the *Circumcision* in the Church of San Francesco at Volterra and an altarpiece in the Duomo, and the next year returned to Cortona and took office as a councilor. The eight frescoes in Mont' Oliveto, near Sienna, were commissioned in 1497, but the greatest works of this master are the frescoes of the chapel of the Madonna di San Brizio in the Cathedral of Orvieto. These were undertaken after Signorelli's sixtieth year. The four great compositions with life-size figures represent *Antichrist, Hell, The Resurrection, and Paradise*. These, with the decorative designs around them, were all executed by Signorelli and his assistant Girolamo Genga within three years and three months. Signorelli painted innumerable altarpieces and frescoes besides the works mentioned. He signed his name in several manners: Lucas Signorellus Cortonensis, also in a Greek form, Λουκάς Κορυντός, also Lucas Coritius, also Lucas Ægidii Signorelli Cortonensis. He was the first of the whole cycle of Italian painters in his mastery of drawing the human figure, and of his use of it in his compositions for its own sake. His frescoes at Orvieto greatly impressed Michelangelo, whose *Last Judgment* testifies to the influence Signorelli had over him. Signorelli died at Cortona in 1523. He had lived there in splendor and luxury, more like a nobleman than a painter, according to Vasari. His son Antonio and his nephew Francesco Signorelli were painters also. Luca Signorelli is well represented in European galleries. For further information, see Vasari; Crowe and Cavalcaselle's *History of Painting in Italy* (1864-71); Robert Vischer, *Luca Signorelli* (Leipzig, 1879); and Kugler's *Handbook*, edited by Sir H. A. Layard (1887).

W. J. STILLMAN.

Signourney: city; capital of Keokuk co., Ia.; on the Skunk river, and the Chi., Mil. and St. P. and the Chi., Rock Is. and Pac. railways; 25 miles E. of Oskaloosa, 28 miles W. of Washington (for location, see map of Iowa, ref. 6-1). It is in a coal-mining region, has important manufactories, and contains a public high school, a national bank with capital of \$50,000, 2 State banks with combined capital of \$100,000, and a monthly and 3 weekly periodicals. Pop. (1880) 1,735; (1890) 1,523.

Signourney, LYDIA HOWARD (*Huntley*): poet; b. at Norwich, Conn., Sept. 1, 1791; established a select school for young ladies at Norwich 1809, and at Hartford 1814; published a volume of *Moral Pieces in Prose and Verse* (1815), and was thenceforth through a long life one of the most popular of American poets. She published fifty-nine volumes of poems, essays, and letters, chiefly on moral or religious themes. She married Charles Signourney, a merchant at Hartford, in 1819; visited Europe 1840; d. at Hartford, June 10, 1865. Among her works were *Letters to Young Ladies* (1833); *Zinzendorff, and other Poems* (1835); *Locahontas, and other Poems* (1841); *Pleasant Memories of Foreign Lands* (1842); *Past Meridian* (1854); and a posthumous autobiography, *Letters of Life* (1866). Two volumes of her selected poems appeared in London 1841, and a choice edition, illustrated by Darley, was published at New York 1848.

Revised by H. A. BEKS.

Sigwart, CHRISTOPH, von. Ph. D., Dr. Theol., LL. D.; b. at Tübingen, Württemberg, Mar. 28, 1830; educated there and became professor in a seminary 1859 and Professor of Philosophy in the University of Tübingen 1863. He is a corresponding member of the Academy of Sciences of Berlin. His principal works are *Spinozas neuentdeckter Tractat von Gott, etc., erläutert* (1866); *Logic* (vol. i., 1873; vol. ii., 1878; 2d ed. vol. i., 1889; vol. ii., 1893; English translation 1894); *Vorfragen der Ethik* (1886); *Die Impersonalien, Eine logische Untersuchung* (1888).

J. M. B.

Sihon, or Sihun: See SYR-DARYA.

SIKES, OLIVE (Lagan), actress and author; daughter of a theatrical manager; b. at Illinois, N. Y., in 1941; made her debut on the stage in Philadelphia 1964; went to England 1967, in which year she was married to Henry DeMille, from whom she obtained a divorce in 1969; became a contributor to English and French papers; published two novels (1966); reappeared on the stage at Wallack's New York, in 1966, in *Barlow*, a play written by herself; retired in 1966, and devoted herself principally to lecturing on women's rights and on other social topics, magazine-writing, and newspaper correspondence. In 1971 she became the wife of William Wirt Sikes. Among her publications are *Photographs of Paris Life* (1961), *Children's Fancies* (1965), *John Mervin's Story* (1966), *Aspects of Women and Theaters* (1969), *Before the Footlights* (1970), *The Mirror World* (1971), *And then behind me, Nature* (1972), and *They Met by Chance*, a novel (1975).
Revised by H. A. BERNES.

SIKES, WILLIAM WIRT, journalist and author; b. at Waterson, N. Y., in 1896. He learned type-setting in his boyhood, and wrote for the newspapers. He was afterward editorially connected with the *Utica Herald*, the *Chicago Times*, and *Evening Journal*, and the *New York Sun*. While in Illinois he was appointed State inspector of canals. He removed to New York in 1927, and in 1971 was married to Olive Lagan. From 1970 to 1982 he was U. S. consul at Cardiff, Wales. He published *One Poor Girl: the Story of Thomasina* (1905), *British Goblins: Welsh Fairy Mythology* (1970), *Russett and Studies in Old South Wales* (1981), and *Scenes of Assassination* (1981). D. in London, England, Aug. 10, 1984.
H. A. BERNES.

SIKHS, *sikhs* [from the Panjabi word *sikha*, or *sikh*, a disciple], the disciples or followers of Nanak, a religious reformer, who was born in the village of Talwandi, now called Nanakana, on the bank of the river Ravi, near Lahore, in A. D. 1469. They form the principal native element of the province of the Punjab.

The history of Nanak is recorded in what are known as the *Janams Nakhis*, or biographical sketches. According to these ancient records Nanak was a Hindu by birth, of the Khatri caste, and the son of a village official. In his early years he sought the society of ascetic monks. At the age of fifteen he misappropriated the money which his father had given him for trade, and gave it to religious mendicants. This induced his father to send him to a relative at Sultanpur, in order that he might be weaned from his affection for a monkish life; but he still continued to give all his earnings to poor mendicants, and reserved but a bare pittance for himself. While in the service of a Mohammedan in Multanpur, Nanak believed that he received ecstatic visions and divine inspirations. When engaged in religious exercises he was translated bodily, so he said, to the gates of paradise, and received a golden goblet of *amrita*, or the "water of life." Then God said to him, "Nanak, I am with thee, and whosoever shall follow thee shall be happy indeed." Nanak recovered from the trance, and when he awoke he uttered those words which have become the keystone of his religious system: "In religion there is no Hindu, and there is no Moslem." He soon began to show evidences of supernatural power, and many miracles are credited to him. He was accepted by the people as a religious guide. His employer was among his first converts, and the eclectic character of his system made Nanak acceptable to Hindus and Mohammedans alike.

He next proceeded to Benares, the sacred city of the Hindus, in order to be brought in contact with the teachings of the Brahmins. Here he succeeded in converting to his cause a large number of Hindus, and a few Moslems. Among those who joined him from the ranks of Islam was the Monk Dard, who afterward became a valuable assistant in making Nanak to combine in his religious system the ideas of the Hindu and of the Moslem. Nanak was, upon his return from Benares, captured among the prisoners taken by the Emperor Babur, and it is said the Mogul ruler was much attracted by the teacher's piety. After his release Nanak renewed his missionary work, and many people joined him. He is said to have visited Mecca, and to have acknowledged Mohammed as a God-sent messenger. He returned to his native river to die (1539 A. D.), after having named Arjun as his successor, the guru or teacher of the Sikhs.

Nanak was an uneducated man, but a book was compiled by one of his successors (the Arjun, the fifth guru, it is said), which claims to record the opinions and teachings of Nanak.

This sacred book, known as the *Adi Granth*, which is written in the Panjabi language, is kept in the Golden Temple of Amritsar, and is guarded and preserved with great honor by a corps of priests and clergymen. It is called by the people the *Grunth Sahib*. An English translation by Dr. Ernest Trumpp has been published in London.

Sikhism may be generally characterized as a pantheistic system, similar to Hinduism, but rejecting caste distinctions and the practice of idolatry. It contains in itself the mystic elements of ancient Hinduism, and the more modern teachings of the Muslim Sufis. The line of teachers who succeeded Nanak is as follows: Arjun, who died in A. D. 1552; Amro-Das, 1574; Har-Das, 1591; Arjun, 1606; Har-Govind, 1638; Har-Rai, 1690; Har-Krishn, 1694; Tegh-Bahadur, 1675; Govind Singh, 1708. Govind Singh led the Sikhs into a great military power. He established the Khalsa, or brotherhood, by which he enrolled the followers of Nanak into an army of fighting men, and conferred upon each member the title of Singh, or lion. After a turbulent reign he was slain by an Afghan follower, and in his dying moments refused to name a successor. He said the *Granth Sahib* was enough to guide them for all time. The Sikhs were little heard of after Govind's death, but the falling power of the moguls, and the repeated invasion of India, first by Nadir Shah and then by Ahmad Shah, the Afghan, favored the revival of the followers of Govind Singh as a military power. In 1763 40,000 Sikhs defeated the Afghan governor of Delhi. In 1765 the Sikhs formed a confederacy, with annual durbars at Amritsar, and are said to have numbered more than 70,000 horsemen. Under the vigorous rule of Runjeet Singh (q. v.) they became an important nation. After his death the Punjab was ruled by a durbar, or council, of Sikh nobles, during the minority of Runjeet Singh's son, Maharsiah Dhuleep Singh. Eventually Dhuleep Singh abdicated in favor of the British, and embraced Christianity. He died in Paris in 1844. The Sikhs are considered admirable soldiers, and there are about 14,000 serving under British colors. Among the leading Sikh princes are the maharajahs of the semi-independent states of Patiala, Kashmir, and Kapurthala.

THOMAS P. HINNES.

SI-KIANG, *sik'kyang*: a river of CHINA (q. v.).

Sik'kin: feudatory state of British India, occupying the upper part of the Tista river basin on the southern slope of the Himalaya Mountains, with Tibet on the E. and N., Nepal on the W., and the British district of Darjiling on the S. It is about 70 miles long N. and S., and 50 miles broad. Area, 2,600 sq. miles. It is governed by a maharajah, aided by a British political resident who has entire charge of the foreign affairs. It is a mountainous, elevated, and healthy territory, producing rice, maize, millet, tea, oranges, cloths, and copper. Pop. (1891) 30,458. The people are Buddhists. The principal towns are Tansing and Gamak. See Edgar, *Report on a Visit to Sikkim* (1874); Strahan, *Report on Explorations in Sikkim* (1889).
M. W. H.

Silao, *sik'-la-s'*: town of the state of Guanajuato, Mexico; on the Mexican Central Railway, and 367 miles by this route from Mexico city; head of a branch road to Guanajuato, 14 miles (see map of Mexico, vol. 6-45). It is on the plateau, 5,910 feet above the sea; is the center of a rich wheat and maize district; and has factories of cottons and woollens. Silao is the ancient Indian town of Citlan. Pop. about 15,000.
H. H. S.

Sile'us [= Lat. = Gr. *Σειλεύς*]: in mythology, son of Hermes or Pan, and the childhood instructor and constant companion of Dionysus. In Asia Minor he was originally the god of flowing water, and so he always carried a skin of water; but in Greece he was degraded to a mere *balanus*, and was represented as a drunken, jolly, fat old fellow with bald head, fat nose, and abundant hair all over his body, and carrying always a skin filled with wine.
J. R. S. S.

Sile'sia: province of Prussia. S. of the provinces of Brandenburg and Posen, bounded E. by Poland, S. by Moravia and Bohemia, and W. by Saxony. Area, 15,537 sq. miles. Along the southern and western boundaries the province is mountainous and rugged, but the whole central part is flat, traversed by the Oder and its tributaries. The soil is generally fertile and well cultivated. Grain, flax, hemp, oil-plants, tobacco, beets, and hops are extensively cultivated. An excellent breed of sheep yields a very fine wool, and important manufactures of linen and woollen fabrics are carried on. The mineral wealth is considerable,

lead, copper, and coal being abundant. Pop. (1890) 4,224,458. Capital, Breslau.

Silesia was from the sixth century inhabited partly by German, partly by Slavonic tribes, and formed a fief or—as it was divided between several dukes—several fiefs, first of the Polish, then of the Bohemian crown. In 1537 the Duke of Liegnitz and the Elector of Brandenburg made an agreement that if either of the two reigning lines became extinct its possessions should fall to the other. In 1675 the ducal family died out, but the German emperor refused to acknowledge the validity of the agreement of 1537, and incorporated Liegnitz and the other ducal possessions as a lapsed fief of Bohemia into the Austrian empire. In 1740 the duchies were seized by Prussia. (See FREDERICK II. of Prussia and SEVEN YEARS' WAR.) Under the Prussian Government the province has developed greatly, and forms one of the richest provinces of the kingdom.

Revised by M. W. HARRINGTON.

Silesia, Austrian: province of Austria, between Prussia, Moravia, and Galicia. Area, 1,987 sq. miles. The northern part is covered by the Sudetic Mountains; the rest is flat, though high. The climate is somewhat rigorous, but healthful. Good crops of rye, barley, and oats are raised, cattle, sheep, and bees are extensively reared, and copper, lead, iron, and coal are mined. Pop. (1891) 605,649, of whom four-fifths are Roman Catholics. Capital, Troppau. M. W. H.

Silhouette [from Étienne de Silhouette, French Minister of Finance in 1759, either because of his excessive public economy, causing his name to be applied to things cheap, or because of his making such figures as a diversion]: a figure drawn in outline and filled in solid, usually with black, without other details than those of the outline; much like a shadow. By extension the term is used when there is some slight delineation of the parts within the bounding line.

Silica or Silicic Acid [*silica* is Mod. Lat., from Lat. *sillex*, *silicis*, flint]: a compound (SiO_2) of SILICON (*q. v.*) with oxygen. It was first pointed out by Smithson in 1811 that this substance is a weak acid, and shortly afterward Berzelius showed that it is one of the most important and widely distributed acids of the mineral kingdom. It occurs in nature partly free, partly in combination in the silicates. Free silica is either crystallized or amorphous. The crystallized varieties contain no water, have the specific gravity 2.66 or 2.3 according to the form, and are insoluble or difficultly soluble in alkalis. The amorphous varieties contain water, have the specific gravity 2.1 to 2.2, and are dissolved by alkalis. The principal form in which silica occurs is QUARTZ (*q. v.*).

Tridymite crystallizes in the same system as quartz, but has a lower specific gravity, 2.3, and constitutes an undoubted allotropic form of silica. It was discovered by von Rath.

Amorphous Forms of Silica.—Silica when precipitated from solution, and when fused, as with the oxyhydrogen flame, assumes the density 2.225, and in this form is highly soluble in caustic alkalis—to a small extent in many saline solutions, and even in pure water. This is the form in which silica is left in the decomposition of many natural silicates by alkaline waters, and it is therefore present in most soils. All amorphous varieties of mineral silica are called opal. Among these are OPAL and HYALITE (*q. v.*). Mixtures of the crystallized and amorphous varieties of silica also occur in nature. Among these are AGATE, CHALCEDONY, CHERT, FLINT, and CARNELIAN (*q. v.*). An analysis of a very pure opal by von Rath gives the formula $3\text{SiO}_2 \cdot \text{H}_2\text{O}$, with the density 1.99, corresponding to 9.84 per cent. of water. Some of these hydrates, however, contain as much as 13, 16, and even 21 per cent. of water, and some opals as low as 5 or 6 per cent. only. This indefinite character of opal is probably due sometimes to admixture with quartz or other forms of silica, a variable insoluble residue being generally left on boiling with an alkali.

The relations of silica to life upon the land are very important. Of the animal kingdom it is but a very trifling constituent, but to many plants silica has the same relation that tricalcic phosphate has to most animals—that is, silica is the main material of the plant-skeleton. Of the ashes of plant-stems, particularly, silica is often found to be a large constituent; thus in ash of rye-straw is found 65 per cent., of potato-stems 36 per cent., and of wheat-straw as much as 73 per cent. Hence the importance of the existence in soils of silica in such form that it may pass in solution into the roots—namely, in the form of soluble silica, or more probably that of hydrated silica.

Silicic hydrates may be obtained artificially by several methods. If solutions of soluble glass (see GLASS) are treated with acids, hydrate of silica precipitates in gelatinous form. This, if well washed and dried over oil of vitriol, gives, according to Doveri, a product of the composition $3\text{SiO}_2 \cdot 2\text{H}_2\text{O}$, which was converted at 212°F. into $3\text{SiO}_2 \cdot \text{H}_2\text{O}$, the same as von Rath's native opal, referred to above. Hydrates may also be obtained by the action of the gaseous fluoride of silicon on water. Fuchs obtained thus the above trisilicic monohydrate, and another, a tetrasilicic monohydrate ($4\text{SiO}_2 \cdot \text{H}_2\text{O}$). Ebelman also obtained a definite hydrate ($2\text{SiO}_2 \cdot 3\text{H}_2\text{O}$) as a transparent solid glass by the action of air upon silicic ether. By DIALYSIS (*q. v.*) Graham obtained a solution of 5 per cent. of silica in pure water, which may be boiled rapidly down to 14 per cent. if no gelatinization is allowed on the edges. This solution is tasteless, with a feeble acid reaction. In the course of a few days it passes spontaneously into a transparent jelly. Addition of a little muriatic acid or an alkali tends to preserve it. Carbonic acid coagulates it, also alkaline and earthy carbonates in minute proportion. Added to a solution of gelatin, this precipitates, together with the silica, about in equal parts. This solution evaporates to a lustrous transparent glass of composition $\text{SiO}_2 \cdot \text{H}_2\text{O}$, containing 22 per cent. H_2O .

Silicate Cotton: See MINERAL WOOL.

Silicide of Carbon: a very hard crystalline substance first obtained about the year 1890 by E. G. Acheson, of Chicago, while experimenting for the production of diamonds in the electric furnace. Under the supposition that he had formed a compound of carbon and corundum, he gave it the name "carborundum," by which it is commercially known. Chemical analysis, however, shows that it has the following composition: Silicon, 69.10; carbon, 30.20; with about seven-tenths of 1 per cent. of oxide of iron, alumina, and lime, which may be regarded as impurities and as imparting color, which varies from nearly white to a deep emerald green and blue. The composition may thus be expressed by SiC , the elements being united atom to atom.

The crystallization is rhombohedral, usually with a broad development of the basal plane, forming hexagonal plates confusedly aggregated and very small, but with brilliant surfaces, an adamantine luster, and transparent. Specific gravity about 3. It is a good conductor of heat, is not fusible before the blowpipe, and is insoluble in acids.

The most important physical characteristic, industrially, is its extreme hardness, which appears to be between that of the sapphire, which it scratches, and the diamond. It is used as a substitute for emery or corundum, and is made into wheels, whetstones, and polishing-cloths. It is manufactured by exposing a mixture of sand and carbon to the heat of a powerful electric current for eight hours. The result is a mass of crystals of small size, which is crushed and the powder digested with dilute sulphuric acid to remove soluble impurities.

See Acheson, *Carborundum, its History, Manufacture, and Uses*, in *Jour. Frank. Inst.* (Philadelphia, Sept., 1893); Schützenberger, *Contribution to the History of Carbosilicene Compounds* (*Comptes Rendus*, May, 1892); *Carborundum*, etc., *The Electrical Engineer*, xv., p. 227 (Mar., 1893); *Science*, xxii., 141 (Sept. 15, 1893).

W. P. BLAKE.

Sil'con [Mod. Lat., from Lat. *sillex*, *silicis*, flint]: an element which, next to oxygen, is the most abundant one in the solid part of the earth's crust. Quartz, sandstones, and other forms of SILICA (*q. v.*) contain over 45 per cent. of their weight of silicon. Granite and gneiss-rocks average 35 per cent. of silicon, slates 30 per cent., and trap-rocks 23 per cent. Silicon was first obtained by Berzelius in 1823 from the silicofluoride of potassium by the action of fused potassium thereon. It appears, when thus obtained, as an amorphous powder of a dull-brown color, which smears the fingers like lampblack. It does not conduct electricity; is not acted on by mineral acids, except hydrofluoric, but dissolved by potash solution. Heated in air or oxygen, it burns brilliantly, forming silica, SiO_2 . Silicon may be obtained in this form also by the action of potassium or sodium on gaseous fluoride or vaporous chloride of silicon; also by the electrolysis of fused silicofluorides, and by heating sand (silica) with metallic magnesium. A second allotropic form of silicon is obtained by exposure of the above to strong heat, which causes it to become denser and pass into graphitoid silicon. This form was obtained in hexagonal tabular crystals by Wöhler by fusing silicofluoride

in potassium with an excess of metallic aluminium, and, after the action, dissolving out the aluminium from the resulting bottom obtained, with acids. Molten zinc dissolves silicon, and, on cooling, the latter crystallizes out as needles. The preparation of needle-formed silicon is accomplished by heating to a high temperature a mixture of sil-silicofluoride of potassium, metallic sodium, and arsenic acid, wires. After the silicon has crystallized out, the sil-silicofluoride is hydrolyzed with acid, and the crystals of silicon are isolated. This form of silicon is also obtained by passing vapor of chloride of silicon over fused aluminium. Another form is fused silicon, which was obtained by Deville by heating above the melting-point of steel. This is dark steel-gray, and hexagonal in crystallization. Deville and Ureux obtained cast ingots weighing nearly a pound. In this modification it will not burn, even in oxygen gas at a white heat.

The allotropic forms of silicon offer a remarkable parallelism with those of carbon; and indeed, there are no elements of such widely different functions in nature, which present so many analogies as carbon and silicon, the first being a characteristic element of the organic kingdom, and the last of the inorganic. Silicon is more electropositive or basetic than carbon, at least at high temperatures, and will even decompose potassium carbonate when fused with it, setting carbon free, with vivid incandescence, potassium oxides being formed. It is therefore a more powerful agent in smelting, reducing than carbon, and if it were cheaply procurable would have valuable practical applications in this way. Silicon combines with iron at high temperatures, and pig-iron often contains it. *Revised by IRA REMSER.*

SILVIA (anc. *Dardaniarum*): town, in Bulgaria; on the Danube, about 70 miles N. W. of Varna (see map of Turkey, ref. A-35); carries on a large trade in wheat and lumber. It is especially important as one of the strongest fortresses on the Danube. Until the conclusion of the Russo-Turkish war (1878) it was for almost 600 years the main bulwark of the Ottoman empire on its northeast European frontier. The Russians besieged it in vain in 1773, 1810, and 1854. In 1828-29 15,000 Ottomans withstood for months the whole army of Marshal Diebitch, but July 1 the town was forced to surrender, and the fortifications were demolished. Though occupied by the Russians in 1877-78, the demolition of its principal stronghold, Arab Tabia, was one of the stipulations of the Congress of Berlin (1878). Pop. (1865) 11,710. It is 6 miles S. E. from Silistria by the treaty of Kainardji (1878) (July 21, 1874) the conditions of which were the most disastrous up to that time imposed on the Ottoman empire.

E. A. GRÖNKÖR.

SILIUS ITALICUS: poet; full name TIBERIUS CAIUS SILIUS ITALICUS, which is found only in one inscription (*Corpus I. L.*, 1884). Born in 25 A. D. at what place it is not known, he acquired some reputation as a pleader at the bar, was consul in 68, and was provincial in Asia, probably under Vespasian. Possessed of ample means, he purchased numerous villas, including one that had been Cicero's, filled them with books and works of art, and devoted himself to literature and philosophy. The latter part of his life was spent in retirement on the Campanian shore, near the tomb of Virgil, of whom, as well as of Cicero, he was an ardent admirer. Among his friends were the Stoics Epictetus and Celsus, and he ended his life in Epicurean fashion by voluntary starvation in 101, being afflicted with an incurable disease. His epic poem, entitled *Punica*, in seventeen books, is the laud of the Roman epics, and also the duldest, evincing, as the younger Pliny says, more industry than talent. The subject is the second Punic war, and the two great heroes are Scipio and Hannibal. *Livy* is his principal source for the facts and Virgil for the phraseology, while various incidents are imitated also from Homer. Of late Silius has found few readers, and has been seldom edited. The best text is given by G. Bader (2 vols., Leipzig, 1890-92). Of some outlines may be mentioned that of Ruppel (2 vols., Göttingen, 1795-96). Another work, entitled *Horatius Latine*, a Latin version or epitome of the *Horatius*, in 1,070 hexameters, is generally ascribed to Silius, and was probably composed at a much earlier period than the *Punica*, and not later than the time of Nero. At the beginning and end are found ascriptions, FRATERNUS SCRIPSEIT. This has been edited by F. Plessius (Paris, 1863). See also R. Döring, *Über den Horatius Latine* (Strassburg, 1884) and *De Silii Punica epicae et metricae et generis didactici* (Strassburg, 1890).

M. WAARSK.

SILK [O. Egg-scales; akin to Russ. *shelk*, Mongol. *sipek*, and obtained from a different source from *Glossa* (silk); a fine, soft, strong, elastic, and lustrous filament or fiber produced by the larvae of certain bombycid moths which feed on the leaves of the mulberry (*Morus alba*) and other trees, and are known as silkworms. (See *SILICONE*.) The same silk is also applied to the textile fabrics woven from these filaments or threads. The finest silk is the product of the *Bombyx mori* or silkworm proper, which feeds on the mulberry. Some of the other varieties of silkworms, which are found in a wild state, produce what is commonly known as wild silk, a rather coarse filament possessing few of the properties of the mulberry-fed silk. Tussah silk, produced by the oak-feeding worm, is woven by the natives of India and China into a cloth of primitive make; and of late years, owing to the improvements made in the mode of reeling it and depriving it of its gum, it has found a more extended consumption in Europe. The extreme fineness of silk adapts it for articles in which appearance has to be combined with lightness and durability. So great is the fineness of the thread formed in the cocoon that several of them have to be reeled together into one single thread. This fineness varies, even in the same cocoon, and reaches as low as 1/100 of an inch in diameter, while the length of the worm's secretion is very great compared with its weight, exceeding 1,000,000 yards to the pound.

Preparation of Silk.—The secretion which the full-grown silkworm emits comes out through two separate sets of tubes which combine in the worm's "spinner" under its lower lip. The cocoon is formed in six or eight days, and in about three weeks the worm undergoes all the transformations into chrysalis and butterfly. The best cocoons are carefully selected and retained for seed—i. e. for the hatching of the moths which are to lay the eggs for the following year. The chrysalides in the other cocoons have to be killed in order to prevent the piercing of the cocoon by the moth, which would make it unfit for reeling. The smothering of the chrysalis can be accomplished in hot-air ovens, with damp air or with dry air, by steam, and by exposure to the hot sun. It has also been attempted with carbonic acid, sulphur fumes, etc. The cocoons are then ready for reeling, and have to be separated in groups in order to obtain as much uniformity as possible in color and quality of the silk to be reeled. Stained cocoons and others having imperfections are grouped separately. Before reeling the cocoons are cleaned by removing the frame which the worm builds before fixing it with the valuable fiber, and which is the fluff or loose silk. The reeling has to be done very carefully, and female labor is mostly employed in doing it. The value of the product, its fineness, its uniformity, are all dependent on good reeling. While the filament in the cocoon is a continuous and independent thread, the glutinous or gummy substance which makes the cocoon a kind of homogeneous mass has to be softened or dissolved in order to permit of the free unwinding of the cocoon thread. The reeling of the silk is done while the cocoons float in a pan of hot water, the temperature of which is between 184° F. and the boiling-point, the spinner touching them lightly with a small broom in order to find the end of the threads that have to be spun together. According to the thickness of the silk to be obtained, from two to six cocoons or more are reeled together into a single thread. Attached to these threads is still sufficient of the gum to cause them to be glued together with a slight pressure of the fingers and a light twist. The combined thread is then carried on to the reel. New cocoons have to be taken and their ends joined to the continuous thread when the first cocoons give out or cease to spin. The thread produced by reeling is known as *raw silk*, and comes in commerce in large skeins or hanks.

Principal Countries producing Raw Silk.—These are Italy and France in Europe; China, Japan, India, and Asiatic Turkey in Asia. Silk is also produced in Spain, Austria-Hungary, Greece, Roropson Turkey, Russia, Persia, Central Asia, etc., but on a smaller scale than in the countries first named. Notwithstanding all the efforts made to introduce sericulture in the U. S., very little raw silk is produced there at a profit. The opening up in commerce of the parts of the far East greatly increased the supply of raw silk available for Europe and America, and as this supply has been increasing at a steady rate, there has been a tendency toward a lower level of prices. The production of raw silk of the world in 1883 and 1894 may be estimated to have averaged about 30,000,000 lb. per annum. Of this China and Japan supplied more than half. Italy produces

about one-sixth of the entire world's supply, France much less. Raw silk is graded in regard to its commercial value; French and Italian is the higher priced, that produced in Asiatic Turkey, Japan, and that part of China known as the Canton district follows, and common China silk shipped through Shanghai represents the inferior grade.

Conditioning.—The raw silk reeled in Japan and China on the European system is classified as *filature*. Native-reeled silk can be reeled; these are known as *recels*. The fineness of raw silk is expressed by a number, which indicates the weight for a certain number of yards. This weight is expressed in *deniers* (old style *pennyweight*), and is called its *titre* (French, *titre*; Italian, *titolo*). Of this there are several standards, the most used being the Milan legal standard and the Lyons standard, the first numbering 1 for each unity of weight of $\frac{1}{5}$ decigram for 450 meters, while the Lyons standard, which is also known as the international, numbers the same unity of weight for every 500 meters. As, however, uniformity in fineness is not obtainable, the "number" of raw silk is usually expressed between limits. Thus if raw silk is numbered 9/11 deniers, it means that for every unity of length it weighs between 9 and 11 times the unity of weight, averaging 10 deniers. A scientific method of assaying silk has been found necessary, in order to establish its title, the amount of moisture it contains, etc. This is commonly called conditioning. Nearly every European city in the industries of which silk plays any part has a conditioning establishment. A certificate is given for each separate parcel, which gives it a sort of legal status, and is sufficient for commercial purposes. Nearly all the silk exported to the U. S. from Europe is accompanied by a certificate of conditioning, while much of the Asiatic silk imported is conditioned in the U. S.

Waste Silk.—Under this general name may be included everything that in the course of the manufacture, from the cocoon to the finished fabric, is eliminated through one reason or another. This includes the pierced cocoons which have been used for seed, and all others that are unadapted for reeling. In reeling the raw silk only about 70 per cent. of the silk in the cocoon is utilized, the rest going as waste. Waste is also made at every subsequent process of manufacture. All this waste is the raw material for a subsidiary but important industry, that of making the yarn that is commonly called spun silk, which can be used for many purposes, as it possesses all the luster of silk. Spun silk is used as filling in silk fabrics; it can be used in combination with wool, cotton, and other fibers, in mixed goods. Spun silk is also much used in the manufacture of velvets and plushes.

Treatment of Raw Silk.—Raw silk has to be thrown before it becomes fit for further process of manufacture. Only for a few special tissues can it be woven as it is. The throwing consists in twisting several threads into one thicker thread. It includes various operations, such as reeling, doubling, cleaning, spinning, doubling again, twisting, and, if the silk has to be dyed, reeling again into skeins. Thrown silk is known as *tram* if to be used for the filling and as *organzine* if to be used for the warp. The tram, being less exposed to friction and to rough handling during the weaving, is less strong than the organzine; it has a smaller number of raw silk threads, and is given less twist in the throwing than is the case with organzine.

Boiling and Dyeing.—Combined with the silk is always present a certain amount of gum, which to some extent impairs its brilliancy. This can be eliminated by boiling the silk with soap, the operation being called "boiling off." Boiled silk is as near as possible the purest silk obtainable for commercial purposes. The loss in weight caused by the boiling may be as high as 25 per cent., but there is a proportionate gain in the brilliancy of the fiber. Boiled silk is used in the richer tissues, in which great luster has to be combined with strength and softness of the fiber. For some tissues only a partial boiling is necessary, while for others all the original stiffness of the fiber is required. The operation of boiling usually precedes the dyeing. The dyeing of silk is a very delicate operation, and while the desired shade has to be produced on the fiber, this must not lose its brilliancy. Silk takes the dye as easily as wool, and more readily than any of the vegetable fibers. Silk can also be bleached by being exposed to the action of sulphur fumes. The loss in weight which silk sustains through the boiling can be regained in the operation of dyeing. The dyer can even increase the weight of the silk by what is called loading, but the increase in weight is often obtained at the expense of the strength of the fiber. This operation is based

on the property possessed by silk of absorbing and retaining other substances. The substances available are white sugar, tannic acid, compounds of tin, lead, iron, and other metals. The excessive loading of silk is intended to deceive the consumer, and such addition is extensively made to black silks, the *charge* sometimes more than doubling the weight. Silk that is not loaded is commonly known as pure dye. The silk is usually dyed in the skeins before being woven. The tissues can be dyed after they have been woven, but usually only the lower-priced and lighter tissues are so treated. The operation is called piece-dyeing, as distinguished from skein or yarn dyeing.

Fabrics of Silk.—The natural qualities of silk make it possible to obtain with this fiber greater diversification in the tissues that can be woven with it than is the case with any other fiber. The weaving is preceded by the operations of winding, spooling, warping, etc., which make the yarn ready for the loom. Improvements in machinery have made it possible to weave almost any fabrics on power-looms, and the greater proportion of the silk tissues now produced are so woven, although some of the richer fabrics require so much care that they can be produced only on hand-looms. In the U. S. the looms are nearly all driven by power, but in Europe there are still many hand-looms. Tissues can be classified into two distinct families. Plain tissues are in one color only, and show no elaborate pattern, the variety in them being obtained by the different arrangement of the warp and filling threads as regards each other. Fancy tissues include all those in the making of which enter more than one color, all figured tissues that show a design. When one color is used for the warp and another for the filling in a plain tissue, the two colors combine, producing a peculiar effect of reflex, known as *changement* (French, *glacé*). Plain silk cloth can be embossed, producing figures in relief; for this purpose only the lighter silk tissues are used. Another peculiar effect that can be produced on silk fabrics, and which is commonly called *moiré*, is obtained by exerting strong pressure on the surface of a grained silk fabric (*gros-grain*) which becomes flattened at certain spots, producing a design. In the weaving of tissues various kinds of raw silk are employed, according to the cloth that has to be woven. The sort of warp that is used for some fabrics is not suitable for others, and the number of twists per yard of length which have to be given to the organzine also varies. In the tissues produced the weave varies according to the position of the single warp and filling threads relatively to each other. Satin has a smooth surface, formed by well-twisted warp threads. Taffeta is relatively light tissue, plainly woven. Pongee is still lighter, and was first imported from China; it is woven in the U. S. and Europe in several varieties, known under different names. The Japanese export large quantities of light silk fabrics, which are known as *habutae* and *kaiki*. Grained surfaces are represented by *gros-grain* and other tissues. A good *gros-grain* has to be carefully woven to insure the regularity of the grain. *Surah* represents the twilled weaves. Ribbed fabrics are also plentiful in silk goods, and are known under various names, according to the thickness of the ribs. Tulle, gauze, gronadine, and veil are transparent fabrics, the weaving of which requires special care, and the threads for which have to be specially thrown, as some of these require thread more twisted than is the case with other goods. Under the name of *armures* are known fancy weaves, which show a special effect or design, usually very small, and formed by the threads themselves without the aid of a change in color. Damask, brocade, and damassé are figured fabrics in which a design is produced while they are being woven. Silk can be woven alone and in combination with other fibers. Good wearable tissues are obtained by weaving together silk and wool. Some dress fabrics are made with silk warp and wool filling. Others have wool warp and silk filling. The principal representative of these is bengaline, which is a silk and wool poplin. To the bengaline family also belong crystal weaves, being large fancy ribbed goods in silk and wool mixtures. Other silk and wool mixtures, known under the names of Ottoman and others, show more or less large ribs, and are principally used for cloaking purposes. Silks also much used in combination with cotton for making cheaper goods, which are used for linings, for umbrellas, and other purposes. The cheaper satins are made of silk and cotton, and are known as cotton-back satins (the silk showing on the satin face, the cotton on the back) to distinguish them from the all-silk satins.

After the tissues have been woven they have to be "finished." This is usually done in separate establishments, and the final operation of manufacturers. The finishing passes the tissues over rollers. Some tissues have to be "steamed," a part or starching substance being added in the finishing process, which is sprinkled over an asbestos transferred on the tissues while they travel on the rollers.

Silk-printing.—Silks are printed—a colored design is produced on them—by means of engraved rollers. The cloth travels in a continuous strand, and as it passes under each engraved roller it receives the impression for one color of which the design is composed. There are two different systems of printing. In the chemical process the process is treated as if they were to be dyed in one color, except due care is taken to prevent the fixation of the color on certain points; on these portions either at once or in the last finishing stage colors appear, thus forming the design. The other process, which may be called the mechanical, consists in transferring every color, ready prepared, and in the form in which the fiber will take it, on the surface of the cloth by means of the rollers. The printing is done on a machine which can give so many different colors as it has engraved rollers, some machines having as many as twelve rollers. In Europe some printing is done by hand with the old-fashioned blocks, but hand-printing is, as a rule, only resorted to for the more delicate and elaborate designs. Lyons, France, has been for a long time the center of the silk-printing industry. Some about 1850 silk-printing has become an important branch of the textile industry of the U. S.

Woolen-silk and Machine Twist.—The invention of the sewing-machine called for the manufacture of a special kind of sewing-silk. This is called machine twist. The making of sewing-silk may be called a continuation of the process of weaving. This branch of the industry was the first to be established in the U. S., where it has reached its full development, importations being very small and insignificant.

The principal silk-manufacturing countries are France, with a product having a value of about \$100,000,000 per annum, and the U. S., with a product valued at about \$80,000,000 per annum. Switzerland and Germany follow with products exceeding \$20,000,000 per annum. Great Britain has an important silk-manufacturing industry, which, however, has made little progress since 1800. It is the largest consumer of silk-manufactures, purchasing over \$50,000,000 worth yearly, and exporting only a comparatively small amount. The U. S. imports over \$20,000,000 worth per annum, and exports very little. With its large home production, the U. S. is now the largest consumer of manufactured silks. France, Switzerland, and Germany, on the other hand, export more than they import. Italy has made great progress since 1870, but has more importance as a producer of raw silk than of silk-manufactures. Japan has made great progress since 1890 as a silk-manufacturing country, and in 1894 exported over 5,000,000 yams (Metric) value of goods.

History.—After wool and linen, silk seems to have been the second-most used of the earliest of textile industries. The Chinese records agree that Hwang Ti, Emperor of China, ordered his first or principal wife or queen, Si-Ling-Chi, to examine some silkworms and test the practicality of using them for the commoners. In her zeal she collected large numbers of the worms, fed them herself, and discovered not only the means of rearing them, but also the method of using the silk and of employing it to make garments. Discovered upon this household discovery was made is left written on the wall of the Chinese chronology, and Chinese records have differed in regard to the date all the way between 2700 B. C. and 1700 B. C. Other particulars in the long and useful reign of Hwang Ti render it probable that he ruled over China during the greater part of the century 2600 to 1700 B. C. The Chinese say that Si-Ling-Chi was killed for this meritorious act, and that she has ever since reigned divine honors under the name of "the goddess of silkworms." The wild silkworms—or at least some of the numerous genera and species of the *Bombix*—were found in great numbers in other countries of Southern or Eastern Asia; they inhabited the jungles of India, Pegu, Siam, and Szechuan-China; but for many centuries the only use made of their cocoons was by carding and spinning the raw, not much as spun silk is now produced. Meanwhile the Chinese kept their methods of rearing silkworms and reeling silk a profound secret for nearly 3,000 years. During this period silkworms had made a little progress west-

wardly among the nations of Central Asia who were under the sway of the Chinese were reeling silkworms under rather tight restrictions; and Persia was for nearly 1,000 years the common market of silk between China and the West, without knowing how silk was made. Aristotle was the first European to learn the true origin of the wrought silk brought to him from Persia on the return of the victorious army of Alexander. He described the silkworm as a bird, passing through successive transformations and producing *bombyx*, the name he gave to the silk. The prevalent theory of the origin of silk among the Greeks and Romans for at least 500 years after this time is given with all seriousness by Ammianus Marcellinus in the first century after the Christian era, in the passage in which he represents the Persians as silk-growers, as "a sedate and gentle people passing their happy days in the most perfect tranquillity and delightful leisure, amid shady groves, fringed by gentle breezes; these groves produce flocks of downy wool which, after being sprinkled with water, is combed off in the finest threads and woven into *serices*" (the Latin name of silk). Vergil also was in reference to silk, "Vestiarum et totis depositis *cauda serice*" (The birds comb the delicate fleece from the leaves). Probably both writers had confounded the gathering of the silkworm from the silk-caterpillar tree (*Bombyx*) of the East with the production of silk.

Silkworms in Europe.—In Aristotle's time Pamphila and her associates in the island of Cos (as possibly Cos), the modern Zos in the Aegean Sea, had imported silk goods, or possibly raw silk, from Persia, and, unwinding it, had woven from the single and delicate threads a silken gauze, which from its transparency received the name of "saron wind." Her example was followed somewhat later by the Roman ladies, who used the silk only for the warp of these delicate tissues, while the weft or filling was of fine threads of linen or cotton. The Phoenicians of Tyre, Sidon, and Berytus also procured raw silk from the Persians, and wore silk gowns for Carthage and Rome. The latter city under the emperors indulged freely in the costly luxury of silk attire. It became the favorite dress of both sexes, and sumptuary laws were passed to restrict its use to women, and to the wealthy among those, under the reigns of Tiberius, Vespasian, and Diocletian. Silk in its raw state was still imported through the Persians, and continued to be till the time of Justinian in the sixth century of the Christian era. That emperor, having engaged in war with Persia, found his supply of silk cut off and the manufacturers in great distress. Two Nestorian monks then arrived at Byzantium from China, bringing with them the seeds of the mulberry, and communicated to him their discovery of the mode of rearing silkworms. The exportation of the eggs of the silkworm or of the unreeled cocoons from China was at this time forbidden under the pain of death; but, stimulated by the persuasions and liberal promises of Justinian, the two monks returned to China, and in 550 came back, by way of Persia and Bokhara, to Byzantium, bringing with them a quantity of silkworm eggs concealed in the hollows of their pilgrims' staves. From this small beginning the culture of silk spread rapidly over Greece and Syria. It was introduced into Spain and Portugal in 711 by the Saracens, into Sicily and Naples in the twelfth century, and probably in the thirteenth into Genoa and Venice. It was not generally extended throughout Italy and Piedmont till the sixteenth century. It did not take root in France till the latter part of the sixteenth century and the beginning of the seventeenth, but during the latter century it made great progress there, as well as in Belgium and Switzerland. The manufacture of silk had begun earlier in France and Germany, and to some extent in England. It is worthy of notice that from the sixth to the seventeenth century the choicest silks, under the names of *muslin* (*canonius*, or six-threaded), *serica*, *siglatus*, or *cyclus*, *dynapens* or *diapens*, *marabouts*, *banderquin* or *bandagins*, and cloth of gold, were woven first for the churches and cathedrals and for the hierarchy of the church, next for kings and emperors, and finally for the higher nobility and the wealthier knights of the age of chivalry. Up to the close of the twelfth century silks—some of them with raised woven figures of Oriental patterns, but the best undecorated by hand with yards of lace—were brought first from the East, from Persia and China, and later from France, where the art of weaving and undecorating these rich textiles was kept secret; still later from Spain, where the Saracens had introduced these arts; and from about the middle of the twelfth century from Sicily, where the Saracens had at first transported their skill

from Spain, but were superseded by Greek silk-weavers whom Roger, King of Sicily, had brought as captives from Corinth, Thebes, and Athens to his own island. Some of these early silks surpass in beauty any of the productions of the manufacturers of modern times. In another hundred years the manufacture of silk had extended to Lucca, and thence, about sixty years later, to Venice, Florence, Milan, Genoa, and Bologna. The manufacture of silk goods was brought from Lucca to Lyons probably as early as the fifteenth century, but it made little progress until silk-culture and the production of the cocoons and raw silk were established at the beginning of the seventeenth century. In England the manufacture had made a little progress in the fifteenth and sixteenth centuries, but all attempts at silk-culture had failed. In Austria, Germany, Switzerland, and the Netherlands there were manufactories of silk, but very little silk was grown.

In America.—The first attempts to introduce silk-culture into America were made very early. James I. having been foiled in his efforts to establish the rearing of silkworms in England, and having learned that the climate of Virginia was favorable for silk-culture, sent over, in 1622, silkworm eggs, white mulberry-trees, and some printed instructions. Large bounties were offered for the production of raw silk, and fines were imposed on every planter who failed to plant a certain number of mulberry-trees, but the enterprise was neglected by the company and thrown upon the planters before it was fully established, and hence failed. Some silk was exported to England for several years, but after a time the attention of the planters was turned wholly to tobacco. At the time when the colonies of Georgia and the Carolinas were founded, the effort was made to revive the culture of silk there, and under vigorous protection and encouragement from England it was for a period of perhaps twenty-five or thirty years very successful. The first shipment of silk from Georgia consisted of 8 lb., and was made in 1735. From this small beginning there was a steady increase to 1759 or 1760. After 1760 the culture of silk declined; probably the next year's yield was not more than \$80,000.

The culture was not attempted in Connecticut till about 1760, but it was carried on there more persistently and extensively than anywhere else in North America. For many years the silk produced in Connecticut amounted to \$100,000 or \$200,000 per annum, but was seldom exported, being mostly made up into sewing-silk and into woven fabrics by home manufacture. The rearing of silkworms was also attempted with some success from 1869 to 1875 in Pennsylvania, New Jersey, New York, Rhode Island, and Massachusetts. In most of these States it had been given up during the Revolutionary war, and was not revived again till about 1835 or 1836. New machinery for reeling, throwing, and weaving silk was invented and put into operation; and as the supply of American-grown silk was not sufficient to meet the demand, a moderate quantity was imported. But the imports of manufactured silks continued to increase. The history of silk-culture in the U. S. has been one of ceaseless efforts toward a goal that has not yet been reached. Silk-manufacture, however, has developed into a staple industry. In 1830 an effort was made to introduce the so-called Chinese mulberry (*Morus multicaulis*) in the place of the white mulberry (*Morus alba*) on which the silkworms had been fed hitherto. Speculation came in and in 1839 twigs of the *Morus multicaulis* less than 2 feet in length and of the size of a pipe-stem were sold for \$2, \$3, or \$5. In the autumn of 1839 the bubble burst, ruining thousands. In 1844 a severe winter destroyed most of the trees, and blighted in the Northern States generally the white mulberry; and for the second time the rearing of silkworms was practically abandoned in the U. S.

Yet great good resulted, in the end, from this apparent disaster. The men who had devoted so much attention to silk-culture, finding the rearing of silkworms unprofitable, turned their energies to the manufacture of silk. From the beginning of the nineteenth century there had been some importation of raw silk, mostly for the fringe and dress-trimming manufacturers, and to some extent also for exportation; in some years it had amounted to \$100,000, \$200,000, and in one year to \$600,000. As yet there was little done save in sewing-silks, dress-trimmings, and a few styles of ribbons; but in the next decade (1850-60) the demand for sewing-machine silk and twist began to increase, and by this time it was found that the best brands of American sewing-silks fulfilled all requirements in quality, evenness,

strength, and color. Pongees, Japanese silks, and other mixed goods were made of as good quality as the imported handkerchiefs, ribbons, and a few pieces of broad goods were put upon the markets, and were creating a demand for more. After years of experiment the spun silks made from silk waste, pierced cocoons, etc., were coming into use, and greatly reducing the cost of those goods of which they could form a part. As yet (in 1860) American silk-manufacturers had received no protection or aid from the Government; but in 1861 the exigencies required the raising of a large revenue, and a duty of 40 per cent. *ad valorem*, which was afterward raised to 60 per cent., was imposed on manufactured silk, while raw silk was admitted free. In 1840 some machinery was taken from Connecticut to Paterson, and gave rise to an industry that has been steadily growing and has caused Paterson to be called the Lyons of America, since it is the principal silk-manufacturing center in the U. S.

In the U. S. nearly everything that is known in the line of silk-manufactures can be produced, although foreign goods find a market either on account of their novelty, as Europe retains the supremacy in designing and in fashion, or because the lower wages paid in other countries enable foreign manufacturers to sell some lines of goods cheaper than they can be produced in the U. S., notwithstanding the import duty.

SILK INDUSTRY IN THE U. S., CENSUS OF 1890.

STATES.	Estab- lish- ments.	Capital.	Average number of hands employed.	Wages paid during the year.	Net value of finished goods.
California.....	9	\$112,288	214	\$83,566	\$266,312
Connecticut.....	35	9,087,042	5,081	2,006,804	8,122,761
Illinois.....	10	422,096	805	285,636	787,845
Maryland.....	4	50,400	75	24,238	100,000
Massachusetts.....	20	3,353,296	3,216	1,296,399	4,611,204
New Jersey.....	132	16,809,927	17,917	7,176,180	25,400,000
New York.....	185	11,165,918	13,151	5,584,399	17,720,000
Ohio.....	3	37,830	40	13,685	50,000
Pennsylvania.....	66	9,362,063	9,522	2,961,334	11,944,000
Rhode Island.....	3	122,256	194	61,978	180,000
All other States.....	5	534,426	698	156,104	551,114
Totals.....	472	\$51,007,537	50,913	\$19,680,318	\$69,154,529

The values of the principal items in the production, as given in the census of 1890, are: Ribbons, \$17,081,447; dress goods, figured and plain, \$15,183,134; machine twist and sewing-silk, \$7,068,213; upholstery goods, \$7,630,506; dress and cloak trimmings, \$4,403,757; tailors' linings, \$3,011,437; other broad goods, \$1,928,036; handkerchiefs, \$1,913,224; fringe, knitting, embroidery, and floss silk, \$1,849,631; hosiery and knit goods, \$1,150,172; velvets and plushes, \$3,141,026; braids and bindings, \$2,771,382; tie silks and scarfs, \$919,919; laces, \$261,750; military trimmings, \$232,600; other goods, \$602,330.

To meet the requirements of the increasing production of silk-manufactures the imports of raw silk in the U. S. have been increasing steadily. This progression is shown by the following table, giving the imports of raw silk in fiscal years:

YEAR.	Pounds.	Value.
1843.....	17,894	\$53,350
1850.....	* 180,010	401,785
1860.....	* 397,877	1,340,676
1870.....	563,589	3,017,958
1880.....	2,562,236	12,024,669
1885.....	3,424,076	12,421,788
1890.....	5,943,366	23,285,059

* Estimated from current prices.

Artificial Silk.—In 1888 public attention was called to a chemically prepared substance called artificial silk. This is a pure cellulose obtained by treating cotton or other fibers with acids; run through a fine funnel it can be formed into a filament that is almost as fine as silk, possesses all its brilliancy, and can be dyed very readily; it is, however, easily set on fire.

F. SANSONE.

Silk-cotton: the cottony down of many malvaceous trees of Africa, India, and South America, of the genera *Bombax*, *Eriodendron*, *Chorisia*, etc. *Eriodendron anfractuosum* is the common silk-cotton tree of the West Indies. The tree is mostly very large, with very soft wood.

Silk, Vegetable: See FIBER.

Silkweed, or Milkweed: a plant of the genus *Asclepias* (q. v.).

SILKWORM. The silk-producing larva of a lepidopteran moth. The silkworm proper, *Bombyx mori*, feeds upon the mulberry, and was originally derived from the northern or mountainous provinces of China, though the wild worm has now been reintroduced. The moth is white, with the fore wings pale and the hindwings reaching the tip of the abdomen, and antennae well provided. The caterpillar is hairy when hatched, with a large head. When fully fed it is pinkish, not very thick-bodied, cylindrical, with a rather close set of several transverse rings and a long horn on the tail. It is six inches long, and of an ash or cream color, in almost every lot of worms raised in India there will be some, after the first moult has occurred, some dark-colored worms, which at first glance appear to be a distinct species, but they are actually types of the original species. The silkworm is an annual, though some allied species yield two or three broods in the warmer parts of India. It moults five times, but occasionally only three times. The eggs are about the size of mustard seeds, and the larva of the first age are one or two lines long, and of a dark color. In five days begins the second stage. In the third stage the worm is reared, whitish, and lives six days before attaining the fourth. The fifth stage is the longest, lasting nine days; and at this time the worm is very voracious. It then ceases to eat, and in about thirty-six days after hatching it begins to make its cocoon, which is spun from the large silk glands opening in the under lip (labium). See **SILK**.

In the rearing of the silkworm the work-room should be well ventilated and warmed, with racks containing frames from 1 to 1½ yards in breadth, with a leader to prevent the worms from falling and lined with paper on the bottom. The eggs laid before the end of winter are hung up in woollen cloths in a cool, dry place exposed to the S. As soon as the heat of the mulberry-tree begins to unfold the eggs are spread out on sheets of paper in very thin layers, passed for three or four days on a table in a room having a southern aspect, but out of the direct rays of the sun. The temperature of the room is gradually raised to 25° C., and maintained till all the eggs are hatched. The larvae are fed six to eight times a day on clipped leaves. The worms are removed to new food by nets placed upon the old food, the worms ascending through the meshes to the fresh leaves placed above. When fully fed the worms ascend into sprigs of hawthorn placed at intervals on the tables. Here they spin their cocoons, some of which are white, producing the best silk, while most of them are yellow. See the illustration given in the article **EXTORTION**.

Of the diseases which affect the silkworm, muscardine was until lately the most prevalent, the losses in France having estimated at one-sixth of the profits. When affected, the worm changes in a darker white, its movements are slower, it becomes soft, and soon dies. Seven or eight days after death it turns hard and reddish, and in a day after the whole body becomes floury. The disease was found by Bassi, an Italian, to be due to the attacks of a fungus, *Bacillus thuringiensis*. But still more destructive is the disease called pébrine, in allusion to the dark spots peppering (whence the term *pebrine*, *pebræ* the skin of the worm). This disease was probably unknown before 1842. Quatrefages believes that the disease is not a new one, but was confounded with anasarca; he compares it with the Asiatic cholera, and makes that it is an hereditary epidemic, and that it may become accidentally contagious and infectious. It originates from the presence of exceedingly minute corpuscles, probably a parasitic fungus, which multiply by self-division and infect the tissues and viscera of the larva, pupa, and adult, as well as the scales of the latter. The disease first showed itself in France, and spread eastward until it reached China, and, in 1855, Japan. It was also a little later introduced into the establishment of Prof. Trauvot, at East Medford, Mass., and carried off from \$5,000 to \$10,000 worth of worms of *Bombyx polyphemus*, the silkworm which he then had under cultivation. Pébrine differs from muscardine in being hereditary. Another disease is called *flacherie*, where the worms become stiffened by the fermentation of the food in the stomach, resulting in the development of vibrios or fermenting fungi. This disease is also hereditary, but, like muscardine, more or less accidental, and not an epidemic, as pebrine is, and does not affect the eggs.

Attracted by the fearful ravages of pébrine, silk-raisers turned their attention to the importation of other silkworms. Of these the tussah and arriola moths are the most manageable and promising. The tussah moth (*Antheraea mylæ*) has a closed cocoon, spun from an un-

broken thread. It is semi-domesticated in India, and the silk is an article of commerce. It spins a hard, most durable silk of a dark-brownish color. While the tussah moth can not be reared in Europe, the related yam-moth (*Antheraea yam-moti*) of Japan, does well in France in the open air.

The *Anastreus* silkworm (*A. m.*) can be reared in Europe and the U. S., and is double-brooded. Though the cocoon is spun at one end, the thread with care can be unwound; in one case an unbroken thread 990 yards long was recorded. The silk, however, like that of the tussah moth is coarse, discolored, and can not be placed in competition with the most inferior mulberry silk.

A similar article is furnished by the American silkworm (*Yponomeuta polyphemus*). The thread is coarser than that of the *Bombyx mori*, but has a rich gloss, and can be used very extensively in commerce. The thread of which the closed cocoon is spun is unbroken, and can be readily unwound. Its larva feeds on the oak, and is thick, fleshy, striped obliquely with white on the sides, with angulated segments, on which are tubercles giving rise to a few short hairs. The pupa is very thick, and the cocoon is regularly oval-cylindrical. The moths leave the cocoons late in May, appearing until the middle of June. They then lay their eggs, generally singly, on the under side of the leaves. In ten or twelve days the caterpillars hatch. The worm moults five times, the first four moults occurring at intervals of ten days, while about twenty days elapse between the fourth and fifth moults. It spins its cocoon late in September, and in six or eight days after beginning it assumes the pupa state, and in this condition passes the winter. A. S. PARSONS, JR.

SIL, EDWARD ROWLAND: poet and scholar; b. at Windsor, Conn., Apr. 20, 1841. He graduated at Yale in 1861; taught school in Ohio; was principal of the high school at Oakland, Cal., 1871-74; Professor of English Literature in the University of California 1874-82, when he returned to Ohio. He was the author of *The Hermitage and Other Poems* (New York, 1887) and *The Venus of Milo and Other Poems* (1888). D. at Cleveland, O., Feb. 27, 1887. A selection of his Poems was published in 1888. H. A. B.

SIL, JOSEPH WOODROW: soldier; b. at Chillicothe, O., Dec. 6, 1831; graduated at the U. S. Military Academy July 1, 1853, and was appointed a second lieutenant in the ordnance corps. After a brief service at the Watervliet arsenal he was recalled to West Point, where he served until 1857 as Assistant Professor of Geography, History, and Ethics; subsequently in command of Vancouver ordnance dépôt, Washington, and Leavenworth dépôt, Kansas. In Jan., 1861, he resigned from the army, and became Professor of Mathematics and Civil Engineering in the Brooklyn Polytechnic Institute. On the outbreak of the civil war he was tendered the colonelcy of a New York regiment, and proceeded to Ohio, where he served as assistant adjutant-general of the State in organizing volunteers, and in the field at the battle of Rich Mountain. In Aug., 1861, he accepted the colonelcy of the Thirty-third Ohio Volunteers, and was engaged in the occupation of Bowling Green, Ky., and Nashville, Tenn., Feb., 1862, and in Gen. Mitchell's expedition to Huntsville, Ala., and seizure of the railroad from Stevenson to Decatur, thus regaining control of Northern Alabama; most of this time he was in command of a brigade. In July, 1862, he was commissioned brigadier-general of volunteers, and commanded a division in the Army of the Ohio at the battle of Perryville, Oct. 8, and subsequent pursuit of the Confederate army. In the battle of Murfreesboro, Dec. 31, 1862, he was killed at the head of his brigade.

Revised by JAMES MERCUR.

Silliman, BENJAMIN, M. D., LL. D.: chemist; b. at North Stratford (now Trumbull), Conn., Aug. 8, 1779; son of Gold Silliman (1730-90), a lawyer and colonel of Connecticut cavalry during the Revolution; graduated at Yale College 1796; was a tutor there 1799-1802, studying law in the meantime; was admitted to the bar 1802, and in the same year chosen Professor of Chemistry in Yale College; spent a part of the years 1802-04 at Philadelphia, preparing for his professorship under the guidance of Dr. James West, house, of the University of Pennsylvania; gave his first full course of lectures on chemistry at Yale in the winter of 1804-05; spent fourteen months in England, Scotland, and Holland 1805-06, engaged in the prosecution of his studies; made a geological survey of a part of Connecticut, the first exploration of the kind in America; published a memoir, with an analysis, of the fragments of the celebrated Weston meteorite of Dec. 14, 1807; aided Dr. Robert Hare in his ex-

periments with the compound blowpipe, with which instrument he demonstrated the fusibility of several bodies never before fused; secured for Yale College the valuable mineralogical and geological cabinet of Col. George Gibbs 1812; founded in 1818 *The American Journal of Science and Arts*, of which he was sole editor until 1838, and senior editor, along with his son, 1838-46; was the first to notice and record the effect of a powerful battery in volatilizing carbon and transferring it from the positive to the negative pole in the state of vapor; was an eloquent lecturer in scientific topics before popular audiences, having been perhaps the first to give such courses in the principal cities of the U. S.; made a second visit to Europe 1851; resigned his professorship 1853, and was made professor emeritus, but at the request of his colleagues continued to lecture on geology until June, 1855, when he retired from active labors. D. at New Haven, Nov. 24, 1864. He was the author of *Journal of Travels in England* (New York, 2 vols., 1810; 2d ed. New Haven, 3 vols., 1820); *Elements of Chemistry* (1830); *A Narrative of a Visit to Europe* (2 vols., 1853); and several minor publications; he also edited Henry's *Chemistry* (1814) and Baskwell's *Introduction to Geology* (1829). An interesting *Life* was prepared from his MS. reminiscences, diaries, and correspondence, by Prof. G. P. Fisher (2 vols., New York, 1866).

Silliman, BENJAMIN, M. D., LL. D.: scientist; son of Benjamin Silliman, chemist; b. at New Haven, Conn., Dec. 4, 1816; graduated at Yale College 1837; became associate editor of Silliman's *Journal of Science* 1838, and associate proprietor (with Prof. James D. Dana) 1846; was an instructor in chemistry, mineralogy, and geology in Yale College 1838-46; became Professor of Applied Chemistry 1846, and successor to his father in the chair of Chemistry 1854, which position he held in the medical department till his death. In 1847, in connection with Prof. John P. Norton, he established the Yale Scientific School, which has since grown into the Sheffield Scientific School. He was also Professor of Medical Chemistry and Toxicology in the University of Louisville, Ky., 1849-54; visited Europe with his father in 1851; was a director in the departments of chemistry, mineralogy, and geology in the Crystal Palace world's fair at New York 1853, and prepared (with Charles R. Goodrich) *World of Science, Art, and Industry* (New York, 1853) and *Progress of Science and Mechanism* (1854), in which the results of the exhibition were recorded; was for many years secretary of the American Association for the Advancement of Science, in which capacity he edited the volumes of *Proceedings*; wrote *First Principles of Chemistry* (1846; revised ed. 1856); *Principles of Physics* (1858; revised ed. 1868); and *American Contributions to Chemistry* (1875); contributed many papers to scientific societies, besides the large number published in his own *Journal*; was a popular lecturer on scientific subjects. D. at New Haven, Jan. 14, 1885.

Silo: See ENSILAGE.

Silo'am [= Lat. = Gr. *Σιλωάμ*, from Heb. *Shiloh*, liter., a sending (of water), aqueduct; Arab. *Silwan*]: (1) a fountain and pool in Jerusalem, on the southern edge of Ophel, 1,708 feet S. S. W. of the Fountain of the Virgin, with which it is connected by a winding tunnel. The fountain proper, hewn out of solid rock, is about 6 feet wide. Like the Fountain of the Virgin, it is intermittent. The lower basin is 52 feet long, 18 broad, and 19 deep, but now holding only 3 or 4 feet of water. It was once arched over. Jewish writers say it furnished the water used in sacrifice on the last great day of the Feast of Tabernacles. Jesus alludes to the practice of sending a Levite with a golden pitcher to get it (John vii. 37-39). This most famous of all the pools in or about Jerusalem is mentioned only three times in the Bible (Isa. viii. 6; Neh. iii. 15; John ix. 7), but frequently by Josephus. In the tunnel alluded to, cut in the solid rock, there was discovered in the summer of 1880 a Hebrew inscription. Prof. A. H. Sayce made the first intelligible copy (Feb., 1881). It is thus translated by Canon S. R. Driver: "Behold the piercing through! And this was the manner of the piercing through: Whilst yet the miners were lifting up the pick, each towards his fellow, and whilst yet there were 3 cubits to be cut through, there was heard the voice of each calling to his fellow, for there was a fissure in the rock on the right hand. And on the day of the piercing thus the miners smote each so as to meet his fellow, pick against pick; and there flowed the water from the source to the pool, 1,200 cubits, and 100 cubits was the height of the rock over the head of the miners." (Heb. Text of the Books of Samuel, p. xvi.) This inscription is proof that the

excavation was begun at each end, probably simultaneously. The inscription is undated, but the shape of the letters apparently shows that it dates from at least Hezekiah's time, and it is certainly one of the oldest known Hebrew inscriptions. 2 Kings xx. 20, 2 Chron. xxxii. 30 may allude to the excavation. See the discussion by A. H. Sayce in *Records of the Past*, new series, i., 168, seq., and S. R. Driver, *loc. cit.* p. xiv., seq. In 1889 a second conduit, some 20 feet below the ground, was discovered leading from the Pool of Siloam to another reservoir which once existed below. To it Isa. vi. 6 is supposed to refer. It was to Siloam that Jesus once sent a blind man to wash (Luke iv. 18). (2) The name of a little straggling, dirty village occupying an old quarry on the east side of the Kedron, overlooking the Pool of Siloam.

SAMUEL MACAULEY JACKSON.

Sil'phium [Mod. Lat., from Lat. *sil'phium* = Gr. *σίλφιον*, an umbelliferous resin-bearing plant, perhaps the *asafoetida*], a genus of perennial plants of the family *Compositae*, comprising twenty species, many of which are found in abundance in the U. S. on the prairies and in the Southern States, also in other parts of North America. They are very hardy and coarse, bear large flower-heads, and exude a plentiful resin-like juice, whence the commonest species (*S. laciniatum*) has received the name of rosin-weed. The stem sometimes exceeds 10 feet in height. Both the resin and the leaves are much employed by farriers for asthma in horses, and a tincture has sometimes been found useful as a tonic and diaphoretic. This species is known by the names of COMPASS-PLANT (*q. v.*), pilot-weed, and polar-plant, from the fact that its leaves have a tendency to stand with one surface facing the E. and the other the W.; the plane of the leaf, which is usually vertical, is thus N. and S. The prairie burdock (*S. ~~rebinthinaceum~~*) and the singular cup-plant (*S. ~~perfoliatum~~*) belong to this genus. Revised by CHARLES E. BESSEY.

(Compass-plant (much reduced).)

Silurian Period [*Siluria* is from Lat. *Silures*, name of a people in ancient Britain]: the division of geological time preceded by the Cambrian period and followed by the Devonian. The name was first applied by Murchison to a rock series occurring in England and Wales in a district formerly occupied by the Silures. In the original description of Silurian and Cambrian rocks a large series was included under both designations, and a long dispute followed. Partly as a means of settling this dispute, but also on paleontologic grounds, the name Ordovician was proposed by Lapworth as the name of a period between the Silurian and Cambrian, and this proposition has received much favor; but the prevailing usage in Great Britain and North America refers the disputed series to the Silurian period, constituting it a minor division under the title Lower Silurian. The Silurian rocks of the U. S. are well developed in the basin of Lake Ontario and in the Champlain-Hudson valley, extending thence southwestward along the Appalachian chain through Pennsylvania, Maryland, Virginia, Tennessee, and Georgia into Alabama. In New England are several outlying areas, in which the rocks are metamorphic. In Ohio, Indiana, Kentucky, and Tennessee are broad areas laid bare by the erosion of the crest of the Cincinnati arch, and a still greater area follows the western coast of Lake Michigan and sends an arm up the Mississippi valley into Minnesota. Other areas are found in Missouri and Texas. The hydraulic cement and salt of New York and the fossil iron ores of the Appalachian chain from New York to Alabama, besides sandstones and limestones of architectural importance, are derived from formations of this period. See CAMBRIAN PERIOD AND GEOLOGY, and for the flora of this period see PLANTS, FOSSIL, and consult Murchison's *Siluria* (1834); Lapworth's *Tripartite Classification of the Lower Paleozoic Rocks* (*Geol. Mag.*, vol. vi., 1879); Sedgwick's *Synopsis of the English Series of Stratified Rocks Inferior to the Old Red Sandstone* (*Proc. Geol. Soc.*, London, vol. ii., 1838).

G. K. GILBERT.

Siluridae (Med. Ent., named from *Silurus*, the typical genus, from Latin *silus* = vat, whence a kind of river-disk, whence also silene) : an extensive family of fishes of the order *Actinopterygii*, comprising the catfishes of Europe and North America. The eel is noted; the opercular, dogfish, and lamprey, especially lampreys, are well developed; gillpoies large and numerous, the laminae being free at the posterior margin; the anterior vertebrae unossified and much modified; the inferior pharyngeal bones distinct. Most of this species live in fresh water, but some are found in warm seas. *Silurus glanis* is the silurid fish found in the rivers of Central and Northern Europe. Among the North American species are the common catfishes or bullheads of the genus *Ameiurus*, the sturgeon of the genus *Acipenser*, and the flathead of the genus *Pleuronectes*.

Silva, 3 years dead, the dramatist, is in Rio de Janeiro, Brazil, May 8, 1792. He went to Portugal when a child, was educated at Coimbra, and became a lawyer in Lisbon. He soon became known as the author of numerous comedies, which were great successes and are still regarded as among the best in the Portuguese language. Silva's mother, who was of Jewish descent, was accused of Judaism, and was imprisoned by the Inquisition; later, suspicion fell on the poet and his wife, they were twice incarcerated, and finally all three were banished to Lisbon, Oct. 15, 1789. H. D. S.

Silva Lobo's, *Barbaeira da Ilhabela*: b. in Bahia, Brazil, Jan. 9, 1761. He studied law at Coimbra, Portugal; held various judicial positions at Bahia and Rio de Janeiro, and in 1790 was imprisoned for a short time on account of his political utterances. His principal published work is *Discursos do Rio de Janeiro* (7 vols., 1804). D. in Rio de Janeiro, Aug. 14, 1840.—His brother, José da Silva Loboza (b. in Bahia, July 16, 1759; d. in Rio de Janeiro, Aug. 20, 1822), was a well-known statesman, leader of the imperialists in the Brazilian parliament, minister from 1826, and the author of numerous works on history and political economy. He was created viscount of Cayré in 1820. H. D. S.

Silver (D. Eng., *silber*, *silber*; Germ., *silber* < O. H. Germ., *silber*; Goth., *silubr*; *silubr* obscure; Lat., *argentum*; Gr. *argyros*, *argente*, *argente*—Is another widespread name of the same metal) : one of the precious metals, known from remote ages, and much used for ornaments, household vessels, and for money. Among the alchemists it was known as *luna*. Its chemical symbol, Ag, is derived from the Latin name. It is the whitest of the metals and takes a brilliant mirror-like polish. In hardness it is intermediate between gold and copper, and it is very malleable and ductile. It may be beaten into foil or leaves 1/10000 of an inch in thickness. A grain of the metal may be drawn out into a wire 400 feet in length. If repeatedly heated it becomes heavier. The specific gravity of silver ranges from 19.3 to 21.4, according to the condition and purity. Knecht found the gravity of fused silver to be 10.4262; H. Rose gives 10.57 for hammered silver, and 10.62 for precipitated silver. The metal fuses readily on charcoal before the blow-pipe or in a crucible in a large or furnace. It expands forcibly upon cooling, and thus solid pieces will float in molten silver as ice floats in water. It may be vaporized by the burning lens or by the oxyhydrogen blow-pipe or strong electrical currents. The vapors are white. When pure the molten metal absorbs from twenty to twenty-two times its bulk of oxygen, according to various authorities, but the presence of a small percentage of copper or lead greatly diminishes or prevents this absorption. The absorbed gas is given off at the moment of solidification, and with considerable force. If the surface of a globule or bar of silver has cooled while the interior is fluid, the expansion breaks the crust and more or less of the fused metal is projected through the cracks and forms an arborescent growth generally known as *spitting*, and when it is projected with violence, as *spitting*. This mechanical projection of a portion of a globule of silver cooling upon a cupel is a frequent source of loss in assaying. The absorption of oxygen and the subsequent spitting may be prevented to a great extent by the use of charcoal powder upon the melted metal. Absorption of oxygen is also prevented by fusing it under a lot of salt. The use of silver in the crucible causes a large absorption of the gas. The vapor of water is decomposed by silver at a white heat, oxygen being absorbed and hydrogen liberated. Silver is a good conductor of heat and of electricity. It is capable of being welded, alloys freely with gold, copper, and several other metals, and crystallizes in some of the monometric systems, generally in octahedra.

Silver is abundantly distributed in nature, particularly among the metallic minerals. Malaguti and Thurell give a table of 178 sources, chiefly of metalliferous minerals, enclosing silver ores proper in most of which silver was found in traces or appreciable quantities. It exists in solution in the ratio of 1 milligramme to 100 kilograms, assuming that there is 1 milligramme of silver per cubic meter of water, it has been calculated that the oceans contain not less than 2,700,000 tons of silver. The metal has been found in small quantities also in rock-salt in the mines of the department of Massif Central, France. All native gold contains from 918 to 44 per cent. of silver, but generally from 2 to 12 per cent. California gold averages about 12 per cent. of silver. It occurs also nearly pure in masses and irregular grains, but it is not so generally distributed in this form as gold, and is seldom found in places or alluvial deposits, being confined rather to the vicinity of the outcrops of veins. It is usually in irregular, ragged masses, or in thin sheets coating surfaces of the veins, or in films, as it flows out into veins. The wire-like form of silver is of frequent occurrence in the matrix of veins. The filaments sometimes reach the length of a foot or more, but are generally much curled up and interwoven or matted together, looking like bunches of hair or wool. Specimens of this description occur in the ore of the Rainbow lode, Walkerville, Montana, and in the Silver King mine, Dinah, Arizona. At Kongsberg, in Norway, the metal has been found massive and in large and perfect crystals, which retain their whiteness without tarnishing to a remarkable degree. One mass taken from these mines and preserved in the Royal Museum at Copenhagen weighs upward of 500 lb. Large amounts of native silver have been obtained in Mexico and South America. One mass in Peru is said to have weighed 800 lb. Large masses have been reported from the northern portion of the Mexican state of Sonora. It is not uncommon, though not in large masses, in the upper portions of the silver-bearing veins of the Western States and Territories of the U. S. It is found also in a vein upon Silver Mt. in Lake Superior, and associated with the native copper of the Keweenaw Point mines. Some of these specimens are remarkable for being completely joined to the copper, without any intermingling of the metals; half of a mass may be silver and the other half copper.

Specimens of silver when taken from mines are usually tarnished a dull brown or even black, this color being caused generally by the presence of sulphurous vapors either from the constituents of the vein or the combination of powder. Such vapors rapidly tarnish silver. Silverware and silver-plate are rapidly tarnished and turned black by the gases of sulphur-water, and also by the tainted atmosphere about drains and vaults, and the sulphurous gases from burning coal. The peculiar whiteness of the Norwegian native specimens is supposed to be due to the presence of a portion of mercury. Native silver is rarely pure. The sulphurous variety sometimes contains 10 per cent. of copper. With gold the proportions are variable. (See *Gold*.) The *electrum* of Pliny contains one-fifth of silver. The pale gold of Transylvania contains from 35 to 36 per cent. of silver. The native alloy in the great Comstock lode of Nevada contains about 43 per cent. of silver, as shown by Atwood, the rest being gold. It is usual to estimate that of the \$550,000,000 in value, in round numbers, produced from the lode \$290,000,000, or a little less than half, was gold. Gold predominated at the surface, particularly at Gold Hill and Cobar Hill, at the two ends of the lode. Native amalgams have been found in Chili, containing from 53 to 64 per cent. of silver. The metal is also found combined with sulphur, antimony, arsenic, tellurium, etc., and with chlorine, bromine, and iodine, giving a great variety of interesting species. The chief ones are the sulphide, containing 86 per cent. of silver; the telluride or antimonial sulphide, with 69.5 per cent. of silver; gray silver ore, with 23 per cent. of silver; dark-red silver ore, with 60 per cent.; and the light-red silver ore, with 64 per cent. This last is generally known as ruby silver, from the brilliant ruby red of the crystals by transmitted light. In the upper portions of silver-bearing veins, where air and moisture have had access, a certain amount of decomposition has taken place among the minerals, especially if they consist of the above-mentioned species, and new combinations have been formed, which may be called secondary ones. These are generally oxides, chlorides, bromides, and iodides, and are more earthy and highly colored than those in the deeper parts of the vein, being intermingled with oxides of copper, lead, and iron. They are also softer than the un-

changed ores below, and are more easy to work. Such ores are known in Mexico as *colorados*, especially if red, and in Peru as *pacos*. The ores from a greater depth in the mine, which have not been acted upon by the air, are more compact, brilliant, and darker in color, and are called *negros*. The green bromide ores are known in Zacatecas, Mexico, as *plata verde*. Chloride of silver is common in the upper portions of rich silver-bearing veins, and usually forms thin dark-colored crusts or films upon the gangue. It is easily identified by its wax-like hardness, and by giving a globule of silver when fused in the flame of a candle.

A large class of the metallic minerals contain silver in varying proportions, especially galena and blende, which are rarely free from a portion of silver. The greater portion of the silver produced in Europe is extracted from argentiferous galena. The galenas of England and of the Harz Mountains carry from .03 to .05 per cent., and those of Tuscany from .03 to .07 per cent. The galena ores of the U. S., with the exception of those of the Mississippi valley, nearly all contain silver in larger quantities, the percentage ranging from .10 to 1.85 and 3.0, but the quantity of these rich ores is seldom large in the Eastern States. Some of the Wood river and Kootenay lead ores carry 100 oz. to the ton, but 30 to 60 oz. to the ton of lead ore is a very fair yield. Formerly lead ores containing less than 10 oz. could not be profitably worked for silver, but since the discovery by Pattinson, of England, in 1829 of the process which bears his name, the cost of separating silver from lead has been greatly cheapened. Lead containing only 3 oz. of silver to the ton can now be worked with profit, and in smelting operations on a large scale where lead ores are used as a flux even a small amount of contained silver is incidentally important.

The antiquity of silver coinage is very great. The most ancient coins known were struck in silver by Phidon, King of Aegina, B. C. 869. After the conquest of Egypt by Cambyses, about 540 years before Christ, a great improvement appears to have been made in the purification of silver, for that which was produced under Aryandes was celebrated for its purity and fineness. The alloy in the Greek silver coinage generally appears to have been lead, which had not been removed for want of the requisite skill in refining. The Athenian currency was noted for its purity, and Xenophon mentions the profit with which it could be exported. Silver currency was adopted by the Roman republic about 269 B. C., and its standard was as high as the Greek, but it rapidly fell. Under Vespasian the alloy was one-eighth, under the Antonines one-fourth, under Severus about one-half, after which there does not appear to have been a fixed standard. (King.) After the loss of Spain, from which the chief supply of silver was drawn, the silver currency vanished, and was replaced by *billon* denarii, having only one-fourth part of silver. According to Pliny, Antony alloyed denarii with iron, apparently to harden the coin. The denarii of Justinian and the Italian Goths weigh about 15 grains troy, and are the reputed direct antecedents of the Anglo-Saxon silver penny.

Silver was largely used by the Romans for household plate and table decoration. It was elegantly chased and embossed in the *repoussé* style by Grecian artists. The wealthy Romans vied with each other in possessing the most massive dishes. Of such dishes, weighing 100 lb. or more, there were 150 in Rome before the first civil war. Pliny cites the existence of one dish weighing 500 lb., with eight plates to match, weighing together 250 lb. The old chased plate of the Grecian artists was valued as a curiosity in Pliny's time. The ornamentation of silver, known as niello-work, originated in Egypt, and was revived and carried to great perfection by the Florentine silversmiths. Cellini gives a recipe for the fusible argentiferous compound used to fill the engraved design. This art was applied to the decoration of armor as early as the days of Homer. Agamemnon's breastplate was thus inlaid. In mediæval times massive plate was in great favor, and the chief form of investment for the noble-born and wealthy. Its extensive use for ecclesiastical decoration is also to be noted. In 1891 over 4,000,000 oz. of silver were sent out from the mints of the U. S. in the form of bars for industrial uses. The total annual consumption of silver in the industrial arts approximates \$10,000,000 coining value, and is increasing.

In modern times solid silverware has been to a great extent replaced by nickeliferous alloys and britannia ware, covered with a layer of pure silver by the galvanoplastic method. Silver may, by this method, be deposited to any desired thickness, thus giving all the appearance of solid

silver, and its utility for most purposes. The annual consumption of the metal for this purpose alone is very large. Silver thus deposited is pure, but solid silverware and silver coin contain a portion of alloy, generally copper. In the U. S. and in France the standard fineness is one-tenth of alloy, or 900 parts of silver and 100 of copper, the mixture being denominated '900 fine. In Great Britain the standard is higher, being 925 of silver and 75 of copper, or '925 fine. This is the fineness of "sterling silverware."

The value of silver relatively to other objects obviously depends upon two chief conditions—the demand and the supply. The demand is seriously affected by legislation, as, for example, by the demonetization of silver. The variations in the demand are sufficiently indicated by the preceding references to its use in historic times. The supply is also variable, and at times excessive. The production of silver in the large way, owing to its mode of occurrence and mineralization, is more dependent upon the use of mechanical power (steam or water) than upon the labor of men, and generally it requires a heavy plant and large capital. There may therefore be a large production of silver in sparsely populated regions and within a short period of time. With gold, however, the bulk of the product is derived from placers. It is so much more generally distributed in the earth that an unlimited number of men may be engaged together in its production. No expensive preparations or chemical operations are required to obtain gold in a merchantable form.

The value of silver relatively to gold has greatly changed within historic times, and it has been different in various countries. Commerce has tended to equalize this difference. King justly observes that in the ancient world silver was to the same extent the peculiar production of Europe that gold was of Asia. It follows naturally that the estimation of silver relatively to gold was higher in Asia than in Europe—a condition prevailing until within a recent period. Sir Isaac Newton in 1717 showed that the ratio in weight of equal values of the two metals, silver and gold, in China and Japan was as 9:1, while it was as 15:1 in Europe. Perhaps the earliest recorded ratio is found inscribed at Karnak, the tribute-lists of Thutmosis (1600 B. C.) giving 13:3:1. The same ratio is shown by cuneiform inscriptions on plates found in the foundations of Khorsabad and on ancient Persian coins. It was reported by Xenophon (400 B. C.) as the ratio in Asia. Toward the Christian era gold fell in value relatively to silver. As early as about 189 B. C. the Romans coincided with the Greeks in estimating the value of gold compared with silver as 10:1. Upon Caesar's return to Rome gold became so abundant that the ratio for a time was as 7½:1. A century later the ratio was as 12½:1, where it remained for 150 years or more. When guineas were first coined in 1663 the value of fine gold compared with that of fine silver was rated in the English mint at about 14:1. In 1805 the ratio was nearly as 15:1, and in other countries gold was rated higher. In the Middle Ages the ratio varied from 9:1 to 12:8:1. At the date of the discovery of America the ratio was about 11:30:1, since which, up to the discovery of gold in California and Australia, it gradually rose to 15:83:1 in the year 1850. In 1870 and 1871 the average commercial ratio was 15:57:1, and in 1873 as 15:92:1, with a gradual increase to 26:49:1 in 1893, and 32:56:1 in 1894.

The annual production of gold and silver in the world, stated in kilogrammes, with the ratio of silver to gold by weight, is shown in the following table:

YEARS.	ANNUAL PRODUCT, KILOG.		Ratio of silver to gold, by weight.
	Gold.	Silver.	
1871 to 1875, mean.	173,904	1,969,425	11:3
1876	165,956	2,323,779	14:10
1877	179,445	2,388,612	13:3
1878	185,847	2,551,364	13:7
1879	167,307	2,507,507	15:10
1880	163,515	2,479,998	15:2
1881	158,964	2,592,639	16:3
1882	148,473	2,769,063	18:6
1883	144,727	3,746,123	19:0
1884	153,193	2,788,727	18:2

The world's production has increased from 41,200,000 oz. in 1870 to 161,766,000 oz. in 1903. The production in the U. S. was approximately 12,875,360 oz. in 1870 and 60,500,000 oz. in 1903. The production for 1894 is estimated at from 50,000,000 to 65,000,000 oz. fine silver. See the reports of the director of the U. S. mint; Southey's tables; *The Mineral Industry*, vol. II.; and the annual circulars by W. J. Valentine, San Francisco, and by Pixley & Abell of London.

WILLIAM P. BLAKE.

Chemistry of Silver Compounds.—Silver forms a number of compounds of practical importance and scientific and medicinal interest.

Silver chloride, or chloride of silver, AgCl, is an important substance, which is found native as horn-silver. The insolubility of silver chloride causes its production, by adding a solution of a chloride, to be an excessively delicate test of the presence of silver in a solution. Gay-Lussac's volumetric method of silver-assay, in use in all U. S. mints, depends on the use of a standard solution of common salt to precipitate the silver as chloride. Silver chloride melts at about 300° F. to a clear liquid. On exposure to light and moisture it becomes darker. When any organic matter is present, as when the chloride is applied to paper, this action of light is far more powerful. Photographic methods are chiefly founded upon these kinds of changes of the halogen compounds of silver by light, the dark compound formed under the influence of the light being insoluble in hyposulphite of soda and other fixing agents, while the unchanged chloride, iodide, or bromide of silver remains soluble, and is therefore easily removed from the paper, leaving the picture composed of the changed dark-colored compound, attached to the paper.

Silver bromide, or bromide of silver, AgBr, constitutes the mineral bromyrite or bromargyrite. It is found as an ore in Mexico and Chili, and at Buelgoat in Brittany. At some of the Chilian mines, as in Chanarillo and in Copiapo, another silver mineral is much more abundant than either the chloride or bromide, which is a combination of the two in varying proportions, called embolite. **Silver iodide, or iodide of silver, AgI,** forms the mineral iodyrite, found in Mexico, Chili, Spain, and Arizona. It is sulphur-yellow when pure, and very soft and brittle. Bromide and iodide of silver, when precipitated, are much more sensitive to light than the chloride.

Silver nitrate, or nitrate of silver, AgNO₃, known also by its ancient name of *lunar caustic*, is manufactured on a large scale owing to its important applications in medicine and in the arts of photography and electro-plating. It crystallizes very easily, and is largely introduced into commerce in crystalline form, though the lunar caustic for medicinal use is generally fused and cast into sticks or pencils. It is soluble in its own weight of cold water.

Silver sulphide, or sulphide of silver, Ag₂S, in pure state, constitutes the mineral argentite or silver-glance. This is, with lead-glance, a regular crystallization, but is often cryptocrystalline or amorphous. The hardness is about that of pyrites, and it has a high degree of sectility, the mineral often cutting almost like metallic lead. It contains, when

pure, 87 per cent. of silver, being the richest of all silver ores. It is common among the ores of the celebrated Comstock lode, as well as in many other localities in the U. S. Sulphide of silver forms, in combination with other metallic sulphides, a large number and variety of argentiferous minerals and ores. With sulphide of arsenic it forms the mineral proustite (3Ag₂S·As₂S₃), containing 65.4 per cent. of silver. This is a magnificent carmine-red mineral, of adamantine luster when crystallized, the crystals being rhombohedral. **Pearcyite** (2Ag₂S·Sb₂S₃), containing 60.5 per cent. of silver, is also a splendid red rhombohedral mineral, of a darker shade of color than proustite, hence sometimes called dark-red silver ore. **Kall silver ore** is also a mine applied to both the arsenical and the antimonial species. **Promet** first showed the true difference between them, as implied in the above formulas in 1864. **Prometite** is abundant in Mexican, Peruvian, and Chilian mines, but rare in the Comstock lode and most North American silver-districts. It was found, however, very fine and in immense masses, with perargyrite, in the Poorman lode in Idaho. **Stephanite** (5Ag₂S·Sb₂S₃), containing 68.5 per cent. of silver, is an iridescent black ore, eight-rhombic in crystallization, found sparingly in the Comstock lode and in many other North American regions. It is sometimes called brittle silver ore.

Revised by LAM HUNTER.

Silver City: city; capital of Grant co., N. M.; on the Atch., Top. and S. F. Railroad; 48 miles N. W. of Deming (for location, see map of New Mexico, ref. 13-Q1). It is in an agricultural and stock-raising region; is principally engaged in mining gold, silver, and copper; and contains a smelter, several reduction-mills, flour-mills, a national bank with capital of \$50,000, and two weekly newspapers. Pop. (1890) 1,800; (1900) 2,102.

Silver Coinage in the United States: The question whether it is the wisest policy of the U. S. Government to admit the coinage of silver in unlimited quantities at the established ratio with gold, or to restrict the minting of the cheaper metal, has for many years constituted an important issue in party politics. A brief summary of the principal arguments advanced on each side of the question is presented in the following paragraphs:

Free Coinage of Silver.—The advocates of this measure point to the necessity of increasing the supply of currency. Both the national banking system and the policy of buying limited quantities of silver bullion and issuing gold-notes for the purchase-money have failed to furnish an adequate currency. Moreover, the latter policy has been objectionable to bimetallics and monometallics alike, the former party desiring unlimited coinage for both metals, the latter fearing that it would lead to the establishment of silver as the sole standard. In the opinion of the free-silver party, the opposition of the monometallics, and of those bimetallics who would defer the adoption of the double standard till other nations agree to accept it, is based upon merely theoretical grounds, and is at variance with the world's experience. It was not till 1873 that the U. S. Government prohibited the coinage of silver money as full legal tender, and for several years it was evident that the majority of the people strongly desired to return to the old system. The Mint Act of 1792 opened the mints of the Government to the unlimited coinage of both gold and silver at the ratio of 15 to 1. There was no fear of a gold or silver inundation, and though the French Government, in 1800 and 1804, adopted the ratio of 15 to 1, thus causing the exportation of gold from the U. S., the silver dollar never lost in purchasing power. In 1834 and 1837 the ratio was changed to 16 to 1, which overvalued gold in respect to silver. As a result, but little silver came to the U. S. mints, and the metallic money was principally gold; yet no one complained, except the advocates of the bank, who, in their opposition to the attempt to supersede the bank-note circulation by gold, demanded the latter metal as bitterly as the national banks have since denounced silver. Thus the disparity between the legal and market ratios caused no complaint on either of these occasions, and nothing like an excessive influx of the cheaper metal resulted. As to the argument that the greater value of gold per weight makes it preferable in large transactions, and therefore more suitable for rich nations, while silver is better adapted for the poorer nations, it has lost all force since the expedient of representing gold and silver coins by certificates has been devised. Certificates representing the gold and silver coin in the treasury are accepted by the people in preference to specie.

From the tables submitted to the committee on coinage, weights, and measures, by the director of the mint in his hearings before that body on Jan. 27, 1892, it appears that at the ratio of 15½ to 1 there is about an equal amount of the two metals in circulation. The output of gold and silver from the mines since 1873 shows also about the same ratio in the respective weights of the metals produced. Nor does the fact that in the latter part of this period the ratio has exceeded this in favor of silver invalidate the argument, for the per cent. of increase when compared to the whole stock of gold and silver is too small to be taken into account, and, moreover, is probably but temporary. Since the ratio of the world from 1803 to the demonetization of silver in 1873 was 15½ to 1, and even since the latter date has been about the same, and since the debts of the world, both public and private, have been contracted at this ratio, it is a gross injustice to the producing classes, which at last liquidate these debts, to readjust the ratio so as to conform to the demonetized price of silver as compared with gold. Measured by commodities, gold has risen 50 per cent. since the demonetization of silver in the U. S. in 1873. Silver, as compared with gold, has not fallen more than 30 per cent. Silver, therefore, as measured by commodities, has not fallen, but, on the contrary, the weight of testimony shows that there has been a slight appreciation of silver in spite of its demonetization.

The Secretary of the Treasury, Mr. Windom, in his annual report for 1889, page 73, arguing against the proposition to put more silver in the dollar, says: "The paramount objection to this plan, however, is that it would have a decided tendency to prevent any rise in the value of silver. Seizing it at its present low price, the law would in effect declare that it must remain there forever, so far as its uses for coinage are concerned." In all the centuries of the past no difficulty has been encountered in the question of using both gold and silver as money. For nearly a hundred years the two metals were at par at the French ratio of 15½ to 1. This condition remained till the U. S. and Germany demonetized silver, or, more correctly speaking, the par remained, notwithstanding the demonetization by the U. S. and Germany, till France suspended the coinage of silver. Had France continued the coinage, the par no doubt would still exist. To demonetize silver and thus cause a greater demand for gold, to compel gold to rise 50 per cent. and then insist that silver shall be coined at a ratio to meet the rise in gold, is a legislative confiscation of the rights of debtors. If this policy were generally adopted it would in effect demonetize at least 30 per cent. of the silver stocks of the world; in other words, it would eliminate about one billion two hundred million in value of silver now in circulation. It would also demonetize 30 per cent. of all the future productions of this metal. A restoration of silver by its enlarged demand and consequent enlarged value is demanded. The free use of silver will lessen the demand for gold and increase the demand for silver, thus causing gold to fall and silver to rise, and in this way the par of the two metals can be brought about without injustice to creditors or debtors.

R. P. BLAND.

Objections to the Free Coinage of Silver.—Some of the principal objections to the free coinage of silver will appear from the following paragraphs: By the Coinage Act of 1873 the standard silver dollar of 412½ grains was dropped out of the monetary system of the U. S. The act was not passed surreptitiously, as has sometimes been asserted by the silver-money men. It was recommended by the Secretary of the Treasury in three successive messages, the bill was printed thirteen times, considered through five sessions of Congress, and the debates concerning it occupy 140 pages of the *Congressional Record*. Nor did it drive silver out of circulation, because there were no silver dollars in circulation, very few having been coined since 1834 owing to the fact that it had been cheaper to coin gold than silver. Nor was it an attempt to injure the debtor class for the benefit of the creditor class, because at the time the silver dollar was worth 102 cents in gold and no debtor would choose to pay in silver. It is necessary to state these facts in order to show that free coinage of silver can not be demanded on the ground of an original injustice committed in 1873.

From 1873 to 1878 no silver dollars existed in the financial system of the U. S. In 1878 the silver-money men succeeded in passing the Bland-Allison bill restoring the silver dollar as legal tender, but providing for only a limited coinage, so that gold still remained the standard. In 1890 the Sherman act provided for the purchase of a larger amount of silver,

4,500,000 oz. per month, but at the same time declaring it to be the policy of the U. S. Government to maintain all dollars at a parity. Here also there was no adoption of free coinage. In 1893 the Sherman act was repealed so far as the purchasing clause was concerned, and in 1894, the President vetoed the bill for the coinage of the seigniorage. The U. S. since 1873 has therefore rested officially on the gold basis, and for the purpose of maintaining this basis it sold \$162,500,000 worth of bonds during 1894 and 1895. On this statement of facts we have the following conclusions:

(1) Free coinage of silver can not be demanded as a matter of justice. Since 1873 all contracts have been entered into on the gold basis, and no injustice has been committed by the Government toward the debtor class.

(2) It is impossible for the Government to maintain the price of silver. Notwithstanding the coinage of \$400,000,000 under the Bland act, and the purchase of \$152,000,000 under the Sherman act, the price has fallen from \$1.29 per ounce to 65 cents per ounce (1895). The fall in the price of silver is due, therefore, to the increased production of silver, not to its demonetization.

(3) Free coinage of silver would not restore its value. Even if it drove all the gold out of circulation the demand for silver as a circulating medium would be limited. If the value of silver went up temporarily an enormous stimulus would be given production, so that the supply would increase and the price would come down. The U. S. would also get silver from other nations who would be glad to unload on it.

(4) Free coinage of silver would therefore not establish bimetallicism, but would drive gold out, bring the U. S. to the silver basis and result in inflation of prices. It is said that this inflation would benefit the debtor class who have suffered so grievously during the last twenty years by the fall of prices. It is not probable that such relief would be attained. The first result of free coinage would probably be contraction of the currency by the loss of gold and sinking of values due to panic. All mortgages due would be foreclosed and the land thrown on the market, or the mortgages renewed only on a gold basis. On the other hand, the creditor class would be injured, and in that class are included all depositors in savings-banks, all beneficiaries of trust funds, and all small investors. All men living on fixed salaries would be injured, because the cost of living would go up. Finally, the laboring class would suffer from increased cost of living and because during inflation wages rise more slowly than prices.

Free coinage of silver would seem to be a very hazardous experiment, bringing more hardship and injustice than it remedies. It would remove the U. S. from the ranks of the great commercial nations with the gold standard. It would destroy public credit and lead to partial repudiation of debt. It would drive away the foreign investor of capital and retard the national development. Owing to the apparently unlimited supply of silver it would make the standard of value very uncertain, thus embarrassing all commercial dealings.

R. MAYO-SMITH.

Silver Creek: village; Chautauqua co., N. Y.; on Lake Erie, at the mouth of Silver creek, and on the Lake Shore and Mich. S., the N. Y., Chi. and St. L., and the W. N. Y. and Penn. railways; 9 miles E. N. E. of Dunkirk, 31 miles S. S. W. of Buffalo (for location, see map of New York, pt. 6-B). It is in an agricultural and grape-growing region, and contains manufactories of milling machinery and a weekly newspaper. Pop. (1880) 1,036; (1890) 1,678.

Silvering: See MIRRORS.

Silver-plating: See ELECTRO-PLATING.

Silverside, or Silver Fish: See ATHERINA.

Silver Stick: in the British court, a title borne by the lieutenant and the standard-bearer of the corps of gentlemen-at-arms; also by the field officer commanding any of the guard regiments. See GOLD STICK.

Silverton: town; capital of San Juan co., Col.; on the Animas river, and the Denver and Rio Grande and the Silverton railways; 285 miles W. S. W. of Pueblo, 494 miles S. W. of Denver (for location, see map of Colorado, pt. 5-B). It has an elevation of 9,400 feet above sea-level; is surrounded by high mountains, including the noted Sulfur Mountain about 2 miles distant; and contains gold and silver mines, smelting-works, a national bank with capital of \$50,000, a State bank, and two weekly newspapers. Pop. (1880) 264; (1894) estimated, 1,100.

Silvestre, seel'vest'r', THEOPHILE LOUIS: writer on art; b. at Fossat, in the department of Ariège, France, Oct. 12.

1822), was educated in the University of Padua and the College of Padua, and began to study law and medicine in Paris, but finally devoted himself entirely to the study of art. In 1833-35 he published *Notions des Artistes vivants*, which attracted much attention (Ed. ed. 1876). Afterward he visited England, published *L'Art des Artistes et l'Industrie des Artistes* (1846), and lectured on art in various cities in Belgium, etc. Among his other works are *L'Apollon de la France* (1861); *Le Musée de la France* (1864); and *Peinture moderne* (1868). D. in Paris, June 20, 1876.

Silvia, 54121, of Aquitania, in the south of France, sister of Rufinus, consul 395 A. D. Her tombing is highly prized by Palladius in his *Historia Rustica*, and to her is ascribed an interesting but incomplete description of a visit to the Holy Land, *Peripetia ad loca sancta*, discovered in a manuscript of the eleventh century at Arles, and edited for the first time by J. F. Marquardt (Rome, 1887), also by J. Parnisowsky (St. Petersburg, 1890). M. W.

Simarubaceae: a family of dicotyledonous trees or shrubs. The leaves are alternate and without glands, and each leafy-stem has only one ovary. The species are mostly inhabitants of warm regions, and the bitter bark of some yields QUERCIN (q. v.).

Simbirsk': government of Russian Russia; on the Volga, N. of Kazan, N. of Nijni-Novgorod. Area, 19,119 sq. miles. The surface is level and the soil fertile. Agriculture, breeding of cattle and horses, fisheries, and manufacture of coarse woollen and linen fabrics are the principal branches of industry. Rye, wheat, buckwheat, hemp, flax, and tobacco are the common crops. Pop. (1890) 1,645,400.

Simbirsk: capital of the government of Simbirsk, European Russia; on the Volga, to lat. 54° 19' N. (see map of Russia, 7-13). It manufactures leather, soap, and candles, and has an important annual fair, held in February. In 1864 and 1865 the town was almost destroyed by fires. Pop. (1890) 30,225.

Simcoe: a lake of Ontario, Canada; situated between Lake Ontario and Georgian Bay; 80 miles long and 15 miles wide, and about 100 feet above Lake Huron, into which it discharges itself through Lake Couchiching, the Severn, and Georgian Bay. Its area is 160 sq. miles. The shores are generally clothed to the water's edge with wood, and small fish are taken in its waters, and of its many islands, one, Snake Island, is a Chippewa Indian reservation.

Simcoe: post-village; capital of Norfolk County, Ontario, Canada; on the river Lynn, 7 miles N. W. of Port Dover; a junction of the "Jasp-line" and the Georgian Bay and Lake Erie Branch of the Grand Trunk Railway (see map of Ontario, ref. 5-13). It has a fine court-house and jail and some manufacturing interests, and is in a fertile region. Pop. (1891) 2,674.

Sim'oon [from Heb. *Sim'on*, lit., hearing with acceptance], the second son of Jacob and Leah (Gen. xxx. 20). He was exposed to the dying Jacob, and Moses passed by the well in silence (Deut. xxxiii.). The tribe of Sim'oon numbered 59,300 at the Exodus, but only 22,300 at the entrance into Canaan (Num. i. 23; cf. xvi. 14). Its territory was scattered, comprising districts wholly within the territory of the tribe of Judah, and tracts in Mt. Seir and Gedor. The tribe sank into obscurity.

Simoon, CHARLES: clergyman; b. at Reading, England, Sept. 24, 1769; educated at Eton and at King's College, Cambridge, where he obtained a fellowship 1788, taking holy orders in the same year. He was appointed vicar of Twelfth church, Cambridge, Jan., 1789, a post which he retained through life, and was distinguished as a leader of the Nonconformist party in the Church of England. He was active in the promotion of missionary enterprise, founding the Church Missionary Society, and organized a successful scheme for the purchase of advowsons or presentations to benefices in the Church of England, in order to secure their being conferred upon evangelical preachers, the fund established by him still having control of some sixty livings. His religious gatherings in Cambridge, known as conversation parties, were famous. D. at Cambridge, Nov. 19, 1830. He published a translation of Claude's *Essay on the Communion of a Sacrament*, to which he added notes and a hundred sermon-sermons, and subsequently published such outlines (2,229 in number) upon the entire Bible, *How Homiletic* (London, 1819-20, 17 vols.). His Works were edited by Rev. T. B. Horne in 21 vols. (1822-33), the best known being the several series of *Shedden-sermons*. His *Life* was written by

Rev. William Carr (1841). See ALDER W. Brown, *Recollections of Simoon's Conversion Parties* (1892); and H. C. H. Mundy, *Charles Simoon* (1893). Revised by S. M. Jackson.

Simoon Stylites (pillar-saint): is at Esau in the northern part of Syria about 300; grew up in solitude as a shepherd in the mountains of Amanus, but in his sixteenth year entered a monastery at Tenedos, where he distinguished himself by the severity of his ascetic practices. Finding the rules of the monastery too lenient, he afterward removed to Tylanassa, in the vicinity of Antioch, where he built a hut and determined to live as an ascetic; but soon his fame for his austere attracted swarms of visitors, and in order to escape their intrusion he placed himself on the top of a tall mountain, where he spent his days and nights, always standing, never resting, exposed to the severities of the climate, nourished by what was brought to him, and occupied by religious exercises. The first column he occupied was only ten feet high, but the last was sixty feet, with a platform four feet in diameter, and here he is said to have lived for about thirty years. He died Sept. 9, 489, and was buried in Antioch; and his example, which gained for him much admiration and even power during his lifetime, found many imitators after his death. The so-called pillar-saints, or stylites, were numerous in the Eastern countries, and did not wholly disappear until the twelfth century. Wulfelich, near Treves, on the Moselle, in Rhenish Prussia, about 560, was the only stylite in the West. Simoon's biography was written by his disciple Antonius, contained in the first volume of *Acta Sanctorum*, and by a contemporary abbot, Cosmas, presbyter of Thaur in Volagria, contained in *Antonius's Acta Monachorum*. Evagrius, in his history of the Christian Church, translated into English in Holm's Ecclesiastical Library, devotes a chapter (D. 13) to him, and describes (14) a visit he paid to the church which included Simoon's pillar. Count de Vogüé, in his *Syrie Centrale* (Paris, 1845-77, t. 141-154), describes his visit to the ruins of the saint's church, now called House of Simoon, which contains Evagrius. Revised by S. M. Jackson.

Simferopol, or **Simpheropol** (Gr. *Σιμφεροπολις*, Latin City): town of European Russia, in the Crimea; capital of the government of Taurida; railway station on the line from Lwow to Sebastopol (see map of Russia, ref. 14-15); beautifully situated on the Salghir, in a picturesque valley surrounded with gardens and orchards. It consists of a modern part, built by the Russians, and the old Tartar town, with its mosques, Tartar schools, and houses. Pop. (1891) 45,620.

Simi'ida [Mod. Lat., named from *Simia*, the typical genus, from Lat. *simia*, ape, monkey]: a family of mammals of the order *Primates* and sub-order *Anthropoidea*, containing the mammals most closely related to man. The form is considerably like that of man, but the anterior limbs are very elongate and the posterior relatively short; the spinal column has a slight sigmoid curve; the lumbar as well as the dorsal neural spines are directed more or less backward; the sacrum is large and solid, composed of four or five vertebrae, and tapers gradually backward; there is no tail; the sternum is broad and short. By all these characters the species are approximated to man. To this group belong two types—one containing large, simian species—i. e. the chimpanzee, gorilla, and orang utan, constituting the sub-family *Simiinae*—and the other comparatively small, slender species—i. e. the gibbons, or sub-family *Hylodinae*. The *Simiida* are peculiar to the Old World (the monkeys of the New World belonging to two different families—the *Cebida* and *Mediida*), and are confined to tropical Africa and Asia. See CHIMPANZEE, GORILLA, and ORANG UTAN.

Simile: See RHYTHM.

Sim'la: districts and town in the Panjab, British India; on the southern slopes of the Himalayas (see map of N. India, ref. 4-E); acquired by the British after the Gurkha war (1816) from the Rajah of Basahle (Bissau). Area of district, 15 sq. miles. Pop. 45,000. The town, 170 miles N. of Delhi, is the permanent abode of numerous Europeans, and during the summer the headquarters of the Government of British India, and the temporary home of Europeans from every part of British India. The houses are not massed together, the town being built according to the old-lage system; the lowest house stands at 6,817, the highest at 8,008 feet. The annual mean temperature has been calculated at 57.8°. There are five warehouses, good hotels, and eight schools for European children—excellent insti-

tutions which are in a flourishing condition. Splendid entertainments and balls are given by the viceroy and high functionaries who pass the summer here. Simla has a theater, a concert-room, Episcopal churches, and one Roman Catholic church. Pop. 13,000. See *Gazetteer of the Simla District* (1888-89). Revised by M. W. HARRINGTON.

Simmons, EDWARD EMERSON: genre and portrait painter; b. at Concord, Mass., Oct. 27, 1852; pupil of Boulanger and Lefebvre, Paris; member of the Society of American Artists (1888); honorable mention, Paris Salon, 1882; third-class medal, Paris Exposition, 1889; Temple silver medal, Pennsylvania Academy, Philadelphia, 1889. One of his best works is *The Carpenter's Son* (1890). He lived for several years at St. Ives, Cornwall, England, and painted there, exhibiting at the Royal Academy, London, and in Paris and New York. He visited the U. S. and painted portraits in New York and Boston in 1891 and 1892. Studio in New York. WILLIAM A. COFFIN.

Simms, WILLIAM GILMORE: novelist; b. at Charleston, S. C., Apr. 17, 1806; studied law, and was admitted to the bar 1827, but abandoned that profession for literature and journalism, publishing in the same year two volumes of *Poems*; became in 1828 editor of the *Charleston City Gazette*, a political journal of Union proclivities, which was discontinued during the nullification excitement of 1832, leaving him in poverty; resided at Hingham, Mass., 1832-33; wrote there his longest and best poem, *Atalantis, a Story of the Sea* (New York, 1833), and his earliest novel, *Martin Faber, the Story of a Criminal* (New York, 1833); returned soon afterward to South Carolina and settled at Woodlands, near Medway; wrote a series of romances founded on Revolutionary incidents in South Carolina, including the *Partisan* (1835); romances of colonial life, of which *The Yemassee* (1835) is considered the best; published 11 volumes of novelettes, collected tales, and essays; 2 volumes of *Views and Reviews in American History, Literature, and Fiction* (1845-46), collected from a large number contributed to the leading magazines and periodicals; a *History of South Carolina* (1840), a *Geography of South Carolina* (1843), and *South Carolina in the Revolution* (1854). He was several years a member of the South Carolina Legislature, and filled other political offices. D. at Charleston, S. C., June 11, 1870. His best works of fiction were republished in 19 vols. (London, 1853-59; new ed. 17 vols., 1865), under the title *Revolutionary and Border Romances of the South*, with illustrations by Darley. A copious selection of his *Poems* appeared in 1864. See the *Life* by George W. Cable in *American Men of Letters Series* (Boston, 1888).

Simon, Sir JOHN: surgeon and sanitarian; b. in England in 1816; was made professor in King's College, London; surgeon to King's College Hospital and to St. Thomas's Hospital; was the first medical officer appointed to the general board of health of the privy council, in which capacities his annual reports on sanitary science, dealing with important questions of the day in medicine, have been of great value. His *Physiological Essay on the Thymus Gland* (1845) gained the Astley Cooper prize of £300. He has received honorary degrees from the Universities of Munich, Dublin, Oxford, and Cambridge. Among his works are *Aims and Philosophic Method of Pathological Research* (1848) and *Lectures on General Pathology* (1850). He has contributed largely to the *Cyclopædia of Anatomy and Physiology* and to scientific and medical periodicals, and edited (with a prefatory memoir) Dr. J. H. Green's *Spiritual Philosophy, founded on the Teachings of the late Samuel Taylor Coleridge* (2 vols., 1865). Revised by S. T. ARMSTRONG.

Simon, sê'môn', JULES FRANÇOIS SUISSE: statesman and political writer; b. at Lorient, department of Morbihan, France, Dec. 31, 1814; succeeded Cousin as Professor of Philosophy at the Sorbonne in 1839, but was dismissed in 1851 on account of his opposition to the *coup d'état*; lectured in 1855 and subsequently on philosophy in various cities in Belgium; was elected a member of the Legislative Assembly for the department of Loire in 1863; offered a strong opposition to the policy of Napoleon III., the plebiscite of 1870, the declaration of war against Prussia, etc., and was a member of the Government for the national defense established on Sept. 4, 1870, and of the Government of Thiers, Feb. 19, 1871-May 24, 1873, as Minister of Public Education. During his term of office he carried through important reforms, but provoked the hostility of the clericals by his efforts to establish compulsory education. On Dec. 13, 1876, he became premier, but difficulties with the

president caused his resignation in May, 1877. Chosen senator for life in Dec., 1875, he has been one of the principal representatives of the conservative republican party. His writings are distinguished by clearness and precision, both of style and ideas, and some are the result of very comprehensive studies. Among them are *Histoire de l'École d'Alexandrie* (2 vols., 1844); *Le Devoir* (1854); *La Religion naturelle* (1856; translated into English by I. W. Cole, London, 1857); *La Liberté* (2 vols., 1859); *L'Ouvrière* (1863); *Le Travail* (1866); *La Politique radicale* (1868); *Le Libre échange* (1870); *Souvenirs du 4 Septembre* (1874); *Dieu, Patrie, Liberté* (1883); *Thiers, Guizot, Rémusat* (1885); and *La Femme du XX^e siècle* (1891). F. M. COLBY.

Simon, RICHARD: biblical critic; b. at Dieppe, France, May 13, 1838; entered the Congregation of the Oratory in 1859, but left it again in 1878: was for a short time priest at Belleville, but retired in 1882 to his native city; devoted himself exclusively to literary pursuits. D. at Dieppe, Apr. 11, 1912. His writings—*Fides Ecclesiæ Orientalis* (1871); *Histoire critique du Vieux Testament* (1878; Eng. trans., *A Critical History of the Old Testament*, London, 1882); *Histoire critique de la Créance et des Coutumes des Nations du Levant* (1884); *Histoire critique du Texte du Nouveau Testament* (1889; Eng. trans., *A Critical History of the Text of the New Testament*, 1889); *Histoire critique des Principaux Commentateurs du Nouveau Testament* (1892); *Nouvelles Observations sur le Texte et les Versions du Nouveau Testament* (1895)—form the first and, both on account of the consistency of the ideas and on account of the learning of his arguments, one of the most powerful manifestations of that theological standpoint afterward known as rationalism. They were violently attacked by the Port-Royalists, Bossuet, and other theologians. See his *Life*, by A. Bernus (Lausanne, 1869). Revised by S. M. JACKSON.

Simone da Pesaro: See CANTAVIUS, SIMONE.

Simonians: See SIMON MAGUS.

Simonides, si-mon'i-dêz (Σιμωνίδης), or **Semonides (Σημωνίδης)**, commonly called of **Amorgos**, though b. at Samos: Greek iambic poet who flourished about 625 B. C. He is known chiefly by a satirical poem—a manner of "Mirror of Women"—in which various types of women are represented as descended from various animals and from earth and sea. Only one type of the sex receives his commendation, the "bee-woman"; the rest are handled without mercy and with a kind of personal spite. The remains of Simonides were edited by Welcker (1835), and by Bergk in his *Poetæ Lyrici Græci*, vol. ii., p. 441 fol. (4th ed.).

B. L. GILDERSLEEVE.

Simonides (Gr. Σιμωνίδης): one of the greatest lyric poets of Greece; b. at Iulis, in the island of Ceos, about 556 B. C.; d. about 468 B. C. His sunny temper and his easy philosophy of life made him welcome wherever his vocation took him, whether he sojourned with the Pisistratidæ at Athens or among the Scopadæ and Aleuadæ of Thessaly. After Marathon, this encomiast of tyrants and oligarchs won the prize over Æschylus for his elegy on those who had fallen in the great battle, and his distich on the dead of Thermopylæ is the most famous in the range of literature. In Sicily he served as mediator between Thero and Hiero (476), and was a special favorite at the brilliant courts of Syracuse and Agrigentum. It was at the court of Hiero that he came into collision with his great rival, Pindar, who claimed for himself a loftier spirit and a truer inspiration; and the very wit and grace of Simonides, his ready sympathy with the spirit of the age, the mundane tone of his poetry, his almost sophistic dexterity have justified the claims of Pindar in the eyes of modern critics. Of his many lyrical poems a fragment remains to warrant what the ancients say of the perfection of his style in everything that he touched, of the exquisite tenderness of his dirges, in which he surpassed all rivals, and of his unequalled command over the resources of the epigram. His fragments were edited by Schneidewin (Brunswick, 1835), and by Bergk in his *Poetæ Lyrici Græci*, vol. iii., pp. 384-535 (4th ed.).

B. L. GILDERSLEEVE.

Simon Magus: a Samaritan of the apostolic age; b. Justin Martyr says (*Apol.*, i., 26), at Gitton, which has been identified with *Kuryet Jit*, a village near Nablus. He is described in Acts viii. 9-24 as a sorcerer, called by the people "that power of God which is called great," who was apparently converted by the preaching of Philip, and sought to purchase with money the power of imparting the Holy Ghost; whence the expression *simony*. Of his subsequent

blows the ancient accounts are utterly dissimilar. The Simonsians, one of the earliest of the Gnostic sects, living for several centuries, took their name from him, and he became a sort of archetypal of heresy.

Simonoski : another spelling of SIMONOSKI (q.v.).

Simony : in canon law, the buying or selling of ecclesiastical offices or benefices. It received its name from Simon Magus, who wished to buy of the apostles, for gold, the power of conferring the Holy Ghost (Acts viii. 18-24). By all Christian denominations simony is considered and denounced as a grave crime, but it has been nevertheless, at various periods, an almost universal practice.

Simoon (from Arabic *samūn*, a sultry pestilential wind, deriv. of *saḥḥa*, to poison) : a hot, scorching wind which comes to the sandy deserts when intensely heated by the sun, and blows, loaded with fine sand and dust, over Palestine, Syria, and Arabia. It generally occurs at the time of the equinoxes, and lasts for several hours. It is much dreaded, as it often proves fatal to animal life, partly on account of its heat, which rises to 120°, partly on account of the suffocating dust with which it is filled. Similar winds are the khamsin in Egypt, the samiel of Turkey, the *sirocco* of Italy, the *solano* of Spain, the *harmattan* of Guinea and Senegambia, etc.

Simplexibentia (Mod. Lat.; Lat. *simplex*, *non plicis*, simple, single & double, toothed, deriv. of *dens*, *dentis*, tooth) : a suborder of rodents. See RODENTIA.

Simplexius : a Neo-Platonic philosopher, native of Cilicia; flourished in the first half of the sixth century A. D. Nothing is known of his personal history except that he had as teachers Ammonius and Damascius, that he taught at Athens, and that he was one of the philosophers who, after the edict of Justinian (A. D. 529) closing the schools of philosophy at Athens, emigrated, at the invitation of King Khosro Nushirvan (Khosroes) to Persia, where their high hopes were doomed to disheartening disappointment, and whence, with the aid of the friendly king, they soon returned to Athens, to enjoy liberty of thought indeed, but not liberty to teach. Simplexius is known principally as a scholar and conscientious commentator on Aristotle. Of his commentaries we still possess those on the *Categorica*, the *Physica*, the *De Caelo* (see *Philosophical Museum*, vol. II, pp. 597, seq.), and the *De Anima* of Aristotle, and one on the *Zoölogica* of Epicurus. Besides these, he is known to have written one on Aristotle's *Metaphysics*. Like most philosophers of his school, he makes no claim to originality. Adopting unquestioningly the doctrine of Plato, he endeavored to bring those of Aristotle into harmony with them by showing that, however much they may conflict in appearance, they do not do so in reality. He was a great admirer of Chaldean and Orphic lore. THOMAS DAVIDSON.

Simplon, Fr. pron. *sâ plô* (Ital. *Sempione*, Germ. *Simplon*) : village and mountain-pass near the boundary between Valais and Piedmont; famous for the military road which Napoleon I. built here from 1800 to 1806. That much-admired piece of engineering, extending from Brig to Domod'Osola, 42 miles long and 30 feet wide, with several long tunnels, 611 bridges, and 10 houses of refuge, was, after the Brenner Pass, the first carriage-road across the Alps. The culminating point is 6,218 feet above the sea. Near by, at the base of Monte Leone (10,977 feet), a hospice has been erected for the gratuitous accommodation of travelers. The scenery on the southern slope is grand and severe to the extreme.

Simpson, ALEXANDER RUSSELL : obstetrician and gynecologist; b. at Bathgate, Scotland, Apr. 20, 1833. He was educated at Edinburgh University, where he graduated M. D. in 1856. Afterward he studied on the Continent, and on his return to Edinburgh was assistant to Sir James Y. Simpson from 1856 to 1865. He practiced in Glasgow from 1865 to 1870, when he returned to Edinburgh University to fill the chair of Professor of Midwifery and the Diseases of Women and Children. He was president of the Obstetrical Society of Edinburgh 1870-77, 1883-85, and 1892-93; president of the Medical-Chirurgical Society of Edinburgh 1890-91 and president of the Royal College of Physicians of Edinburgh 1892-93. He was author of *Sir James Y. Simpson's Clinical Lectures on the Diseases of Women* (Edinburgh, 1877); author of *Contributions to Obstetrics and Gynecology* (Edinburgh, 1896), and of many papers and lectures published in the *Edinburgh Medical Journal* and *British Medical Journal*. S. T. ARMSTRONG.

Simpson, Sir GEORGE : b. at Lochbroom, Ross-shire, Scotland, about 1796; accompanied the Earl of Selkirk, who employed him in the establishment of his Red River colony, in Canada 1820; pushed his settlements northward to Athabasca Lake in rivalry with the Hudson Bay Company, and after the two companies had concluded (1821) received the appointment of governor of Rupert's Land and of general superintendent of the affairs of the Hudson Bay Company. He planned the successful expedition under his nephew, Thomas Simpson, 1836-39, which traced the coast of the Arctic Ocean from the mouth of Mackenzie river to Point Barrow, and from the mouth of Coppermine river to the Gulf of Boothia. He made an overland journey around the world 1841-42, of which he published a *Narrative* (2 vols., London, 1847); was knighted in 1855. D. at Lochbroom, near Montreal, Canada, Sept. 7, 1893.

Simpson, JAMES HENRY, A. M. : soldier; b. in New Jersey, Mar. 9, 1813; graduated at the U. S. Military Academy July 1, 1832, and was assigned to the artillery; was mainly in garrison until 1838, when transferred to the topographical engineers with rank of first lieutenant (captain 1856, major 1861, lieutenant-colonel of engineers 1865), and was thenceforward engaged on the survey and improvement of lakes and harbors, and on lighthouse and Coast Survey duty until 1859; was then appointed chief topographical engineer with the army in Utah, and opened a wagon-route from the valley of Great Salt Lake across the Great Basin of Utah, by which the journey to the Pacific coast was shortened some 200 miles; a report of which he submitted early in 1861. In the early days of the civil war he served as mustering officer in Ohio and chief engineer of department of the Shenandoah. He was appointed colonel of the Fourth New Jersey Volunteers Aug. 12, 1861, and in the Virginia Peninsula campaign led his regiment in the action at West Point and in the battle of Gaines's Mill, where he was taken prisoner and held until Aug., 1862. On his release he resigned his volunteer commission, and thereafter served as chief engineer of the department of the Ohio and had general charge of fortifications in Kentucky till the close of the war. In Aug., 1863, he was detailed as chief engineer of the Department of the Interior on proposed change of route of the Union Pacific Railroad, W. from Omaha, and served as Government commissioner of that road until 1868; subsequently engaged in the regular line of duty with his corps, in which he attained the rank of colonel in 1867; was brevetted colonel and brigadier-general; retired 1880. D. at St. Paul, Minn., Mar. 2, 1888. Revised by JAMES MERCUR.

Simpson, Sir JAMES YOUNG, M. D., D. C. L. : obstetrician; b. at Bathgate, Scotland, June 7, 1811; educated at the University of Edinburgh and at the medical school of the same institution, taking his degree 1832; lectured there on pathology 1836; became Professor of Midwifery 1840; introduced the use of chloroform as an anæsthetic 1847; became president of the Royal Society of Physicians at Edinburgh 1849, and of the Medical-Chirurgical Society 1852; foreign associate of the French Academy of Medicine 1853; received the Montyon prize for his introduction of anæsthesia 1856; was made a knight of a Swedish order about 1854; was created a baronet 1867, and enjoyed an exalted reputation, not only as a skillful medical practitioner but as an eminent antiquarian. D. in Edinburgh, May 6, 1870. In 1871 his principal works were collected under the title *Selected Obstetrical Works, Anæsthesia and Hospitalism, and Clinical Lectures on the Diseases of Women*; and his *Archæological Essays* appeared in 1872.

Revised by S. T. ARMSTRONG.

Simpson, JOHN PALGRAVE : author; b. at Norfolk, England, in 1805; was educated at Corpus Christi College, Cambridge; traveled for several years on the Continent, and published *Second Love* (1846); *Giulia and Letters from the Danube* (1847); *Lily of Paros; or, The King's Nurse*, and *Pictures from Revolutionary Paris* (1848). After his return to England, in 1850, he wrote with success for the stage—*The World and the Stage*, *Syllabus; or, Step by Step*, etc.—in all about forty pieces of various kinds. He also published a *Life of Karl Maria von Weber*. D. in London, Aug. 19, 1857. Revised by H. A. HARRIS.

Simpson, MATTHEW, D. D., LL. D. : scholar; b. at Cadiz, Harrison co., O., June 20, 1810; graduated at Madison College, Pennsylvania, 1822, and was tutor in the same institution 1824-25; studied medicine and received the degree of M. D. 1828; was licensed the same year in the ministry and joined the Pittsburg Conference of the Methodist Episcopal

Church; became vice-president and Professor of Natural Science at Allegheny College 1837; president of Indiana Asbury University at Greencastle, Ind., 1839; editor of *The Western Christian Advocate* 1848, and was elected bishop 1852. He was an intimate friend of President Lincoln, at whose request he devoted much of his time during the civil war to the maintenance of public sentiment in behalf of the Union by addresses in many Northern cities, being also employed by the Government in several important confidential commissions. In 1863-64 he made an extended tour of inspection of the missions of his Church in Syria and the East generally, and traveled through several countries of Europe upon a similar errand. He visited the Mexican missions 1874, and the European mission conferences 1875, and on his return became a resident of Philadelphia. Author of *A Hundred Years of Methodism* (1876); *Cyclopædia of Methodism* (1879); *Yule Lectures on Preaching* (1879); and *Sermons* (1885). D. in Philadelphia, June 18, 1884. See his *Biography*, by G. R. Crooks (New York, 1890).

Revised by A. OSBORN.

Simpson, THOMAS: mathematician; b. at Market-Bosworth, Leicestershire, England, Aug. 20, 1710; was in early life a weaver, but became an accomplished mathematician by private study; was for some years a teacher in Derby and in London; became Professor of Mathematics in the Royal Military Academy at Woolwich 1743, and a fellow of the Royal Society 1745; and published many ingenious papers on pure mathematics and physical astronomy. He published works on fluxions, the laws of chance, doctrine of annuities, algebra, geometry, and trigonometry. D. at Market-Bosworth, May 14, 1761.

Simrock, KARL: poet and author; b. at Bonn, Germany, Aug. 28, 1802; studied jurisprudence in his native city and in Berlin; entered the Prussian civil service, but was dismissed in 1830 on account of a song he wrote on the revolution of July in Paris; devoted himself to literature, and studied especially the old German language and literature, of which he was appointed professor at Bonn in 1850. His chief poetic work is *Wieland der Schmied* (1835), one of the best epic poems of modern German literature, in which the old hero-legend is successfully revived. He translated with excellent taste and remarkable skill the *Nibelungenlied* into modern German (1827); several works of the minnesingers: the *Edda* (1851); *Beowulf* (1859) and *Heliand* (1856); Shakespeare's *Sonnets* (1867); Tegner's *Frithiof's Saga* (1863); and many other medieval works of poetry. He also published a *Handbuch der deutschen Mythologie* (1864); *Die Rheinsagen* (1836); *Deutsche Volksbücher* (1839-67); *Quellen des Shakespeare* (1831), and other works. D. at Bonn, July 18, 1876.

Revised by JULIUS GOEBEL.

Sims, GEORGE ROBERT: journalist and dramatist; b. in London, Sept. 2, 1847; was educated at Bonn; entered journalism, and contributed to the press the *Dagonet Ballads* (1879); *Three Brass Balls* (1880); *The Social Kaleidoscope* (1880); *Ballads of Babylon* (1880); *The Theatre of Life* (1881); *How the Poor Live* (1883); *Stories in Black and White* (1885); *Mary Jane's Memoir* (1887), etc. His letters to the *London Daily News* on the condition of the poor attracted much attention, and led, in part, to the appointment of a royal commission. Has written with success for the stage—*The Lights of London* (1882); *The Romany Rye* (1883), etc.

H. A. BEERS.

Sims, JAMES MARION, M. D., LL. D.: surgeon; b. in Lancaster co., S. C., Jan. 25, 1813; graduated at South Carolina College, Columbia, 1832; studied medicine at Charleston and Philadelphia, graduating M. D. at Jefferson Medical College 1835; in 1836 entered upon the practice of his profession at Montgomery, Ala.; in 1845 called attention to his new theory of the nature and origin of trismus nascentium, and also to the subject of vesico-vaginal fistula, inventing instruments and an operation for the cure of that lesion. He urged the use of metallic sutures in every department of general surgery. In 1852 he published a full account of his discovery in *The American Journal of Medical Sciences*. In 1853 he settled permanently in New York. His investigations of the diseases peculiar to women early led him to perceive the importance and necessity of establishing a great permanent woman's hospital in New York, and a temporary hospital was opened in May, 1855. Dr. Sims was elected attending surgeon, with Drs. Mott, Francis, Stevens, Green, and Delafield as a consulting board. In 1857-58 he obtained from the Legislature a charter for the Woman's Hospital of the State of New York, and the city of New York

granted a site on which a hospital was built. In 1861 Dr. Sims went to Europe, and he operated in Dublin, in London, in Paris, and in Brussels. He received decorations from the French, Italian, Spanish, Portuguese, and Belgian Governments as a public benefactor. In 1868 he returned to New York. In 1870, on the breaking out of the Franco-German war, he organized in Paris the Anglo-American Ambulance Corps, took charge of it as surgeon-in-chief, and went with it to Sedan. Soon after this Dr. Sims returned to New York. To his labors and discoveries are mainly due the establishment of the science of gynecology as a new department in medicine, recognized by a special professorship in all well-organized medical colleges. Dr. Sims was a corresponding member of many learned societies in the U. S. and Europe, notably of London, Edinburgh, Berlin, Christiania, etc., and of the Royal Academy of Medicine of Brussels. He was elected president of the American Medical Association at its meeting at Louisville, Ky. D. in New York, Nov. 13, 1883. There is a monument of him in Bryant Park, New York. See his autobiography, *The Story of my Life*, edited by his son, H. Marion Sims, M. D. (1884).

Sinai, sī'nā, or sī'nī [from Heb. *Sinay*; cf. *Sin*, the wilderness of Sin, liter., clay]: (1) a triangular peninsula of Arabia Petraea, between the Gulfs of Suez and Akabah. Its apex points S.; its base is 150 miles across from gulf to gulf; its western side 186 miles long, its eastern side 133, and its area about 11,500 sq. miles. First comes the wedge-like protrusion of the limestone plateau known as the Desert of the Wandering, then a sandstone belt, and finally the mountain-masses of granite and porphyry, flanked right and left by narrow strips of lowland bordering the gulfs. These mountains may be divided into three groups, the highest peaks of which, respectively, are Serbal (6,734), Catharine (8,526), and Shomer (8,449). The ancient Egyptians called this peninsula "the land of the gods." Its solitary grandeur impresses all travelers alike. Mines of iron, copper, and turquoise were once worked here. It is still the home of about 5,000 Bedouin. The curious inscriptions, found mostly on the western side of the peninsula, are generally in the Nabataean character, and the Nabataeans were, about the beginning of the Christian era, the chief traders between Egypt and Assyria. They were an Arab people living on the east and southeast of the Holy Land. Some of the inscriptions are Greek and a few Coptic. With them are rude drawings. The whole was probably the work of caravans between 200 B. C. and 400 A. D., and of no more importance than such scratchings usually are.—(2) Used in the Old Testament interchangeably with Horeb to designate the Mountain of the Law. Lepsius and others have tried to identify it with five-peaked Serbal, the most picturesque of all the mountains of the peninsula; but the true Sinai is a gigantic mass, about 2 miles long from N. to S., and about half a mile wide from E. to W. Its southeastern peak, called Jebel Musa, is the traditional scene of the giving of the Law; but there was not open space enough on the south side of the mountain to accommodate the Hebrew host. Its northwestern peak, called Sufsafeh, overlooks three wadies (Rahah, Deir, and Leja), which might easily have held 3,000,000 or 4,000,000 people; and there is no other such spot anywhere in the whole peninsula. Here the Israelites encamped for a year, and here the Law was given. The watershed at the foot of Sinai is 5,140 feet above the sea, Jebel Musa 7,359, Sufsafeh a little lower. The famous convent of St. Catharine, in whose library Tischendorf discovered the Sinaitic Codex of the Scriptures (in 1844), and Mrs. Agnes Smith Lewis the oldest text of the Syriac Gospels (in 1893), is on the east side of the mountain.

Sinaitic Inscriptions: See CODEX SINAITICUS.

Sinaloa, sī-nāā-lō'ā (sometimes written CINALOA): a northwestern maritime state of Mexico, bounded by Sonora on the N. W., Chihuahua and Durango on the N. E., Tepic on the S. E., and the Pacific and the Gulf of California on the S. W. (see map of Mexico, ref. 4-D). Area, 36,184 sq. miles. The eastern and northeastern parts are covered with spurs and terraces of the Sierra Madre, which have a true mountainous character, and sometimes attain 6,000 feet in altitude; on their slopes are extensive oak forests, and the valleys are very fertile. The coast belt is low, and in parts unhealthy; there are many lagoons near the gulf. Several rivers cross the state, flowing down from the Sierra

Madras, but none of them is navigable. The greater part of the coast is in the temperate zone; in general, however, the climate of the coast belt is essentially tropical, and the interior lands have a mild and equable climate (tropical temperate). The rainy season (June to September) is well marked in the hills, but in parts of the coast belt the rainfall is insufficient for agriculture and the vegetation is scanty. The state is rich in gold and silver, and mining is the most important industry; agriculture is generally on a small scale, sufficient only for home consumption. There are considerable manufactures of cotton cloths, etc. Pop. (1881 estimated), 945,733; a large proportion are Indians or mixed races. Capital, Calicut; chief port, Madras. Among the ancient capital cities N. N. W. of Calicut, on the coast, Calicut, had formerly 10,000 inhabitants, now reduced to 5,000. D. H. S. S. S.

Sikapis: See Sikapis.

Sikapis, Sir James: author, b. at Thorne Castle, Wiltshire, England, May 10, 1734; educated at the University of Edinburgh, Glasgow, and Oxford; became a member of the Faculty of Advocates at Edinburgh 1755; was called to the bar at Lincoln's Inn 1782; published *History of the Public Revenue of the British Empire* (3 vols., 1785-86); was made a baronet in 1790, took up the post of Thorne; was induced to working the fisheries and in establishing the Scottish Society of Woolgrowers (1790) and Board of Agriculture (1791), of which associations he was the first president; maintained an extended correspondence with Gen. Washington and in Parliament with brief interruptions from 1790 to 1813; compiled *A Statistical Account of Scotland, drawn up from the Communications of the Ministers of the Different Parishes* (Edinburgh, 21 vols., 1791-99); wrote in all 39 volumes and 367 pamphlets, covering almost the whole range of literature, being aided therein during his later years by his daughter Catherine, who became eminent as a novelist. D. in Edinburgh, Dec. 21, 1813. — His eldest son, Sir George, b. in Edinburgh, Oct. 25, 1770, was for some years a member of Parliament, and wrote several works against Roman Catholicism. D. in Edinburgh, Oct. 9, 1802. — Another son, John, b. in Edinburgh, Aug. 20, 1777, was archdeacon of Middlesex from 1842; published *Memoirs of his father* (3 vols., 1817), and *Nicholas of Old Times* (1875). D. in London, May 25, 1875.

Sikapis River: See St. Clara River.

Sindh, Sind, or Seindia: western province of British India, adjoining Baluchistan; part of the Bombay Presidency; on the lower Indus, W. of Baluchistan and N. of the River of Ravi. Area, 47,729 sq. miles, or including the tributary state of Khairpur, which forms a part of it administratively, 54,490 sq. miles. It occupies the Indus delta, and is for the most part unbrokenly nearly level, with many dead and few live watercourses. The desert of Thar occupies its western part and that of Sukkur the northwest. The soil is sandy or clayey, and is much impregnated with salt and alkali. It lacks the monsoon and rain in some parts is almost unknown. The Indus bears to it the same important relation that the Nile does to Egypt. The climate is generally hot and the extremes great. It is considered unhealthy, and is especially subject to fevers and cholera. Only 7 or 8 per cent. of the land is cultivated, and nearly all of this has to be irrigated. The canals have a total length of about 3,000 miles. There are two annual crops; those of the spring are chiefly cereals, legumes, and oil-seeds. The second harvest yields millet, rice, and cotton. The fruits are numerous and excellent. The fauna includes the tiger, hyena, wolf, fox, mung, wild boar, antelope, and deer. Fishing was an important industry, and dried fish are exported. The population in 1891 was 3,974,774 for the districts of Sindh and 1,046,161 for Khairpur, an increase since 1881 of nearly 20 per cent. in the districts, but a decrease for Khairpur. The inhabitants are mostly Mohammedans, including the indigenous Sindhis, formerly Hindus, now Samitis. These form about half of the population; they are tall, robust, athletic, and fair, are without caste, have a pure Neo-Sanskrit language of great interest, with a small literature, chiefly historical and from Arabic sources. The capital is Karachi (see Karachi); pop. (1891) 165,129. A railway extends from this place up the Indus to the Punjab, with a branch from Sukkur into Baluchistan. This is a very ancient country historically. It was probably visited by the Persians under Sogdian, and by one of the generals of Alexander the Great. It probably formed a part of the Gissos or Juk-district, kingdom. The second city of Patala was

once its capital, and it is supposed that Haidarabad, a later capital, occupies the site. It has undergone remarkable political revolutions, and the variations in the course of the Indus have made its physical changes more remarkable. It contains numerous cities of towns and cities, often in locations now entirely untenable because of lack of water. It became a British province in 1843. See Ross, *The Land of Five Rivers and South, Northern History and Description* (1891). MARK W. HARRISON.

Sin'dia, or Seindia: the dynasty named the most powerful of the native Malabar princes of India, having their capital at Swat. The family took its rise in the person of Hadrat Sura, a low-caste ruler of the Malabar country, who rose to a high rank in the body-guard, and in 1740 received as a fief half of the province of Malabar.—His son, Muzumdar (d. 1794), joined the Malabar confederacy, fought against the Afghans at the great battle of Panipat (1791), became a useful ally of the Emperor of Delhi, expelled the Sikhs from Panipat, India, and became virtual ruler of the empire; fought against the British 1770-82; was confirmed in his possessions by the treaty of 1782, captured Swat (1784), acted as Delhi and Agra; reduced the Rajput states, and formed a vast army, well disciplined by French adventurers.—His grand-son and successor, Daulat Rao Sinha, ruled from 1794 to 1807; waged war with varying success against the rival family of Holkar; was defeated by Sir Arthur Wellesley (afterward Duke of Wellington) at Assaye, and by Lord Lake at Laswari, and submitted to British influence, but retained his capital and a portion of his territories.—Rao Rao Sinha (1843-50) was a loyal ally of the British during the mutiny of 1857-58.

Sin-gan-fu, sing-gan-fu, or Si-an-fu (sometimes Si-nan-fu): city of China; capital of the province of Shensi, and the capital of the empire during some of its most famous dynasties—e. g. the early Han (202 B. C.-24 A. D.), the Tang (618-907 A. D.), and the Sung (960-1127). It is splendidly situated in the basin of the Wei, the most important affluent of the Yellow river, and is surrounded by great importance. Its walls, which have a circuit of 24 miles, are well built, and its pavilioned gates surpass in magnificence those of Peking. It is the seat of a Roman Catholic bishopric, and contains the oldest mosque in China, founded about 1,100 years ago. In 1808-71 the city and surrounding country suffered much from the Mohammedan rebellion. Pop. about 200,000. Here in 1857 was found an immense tablet covered with inscriptions in Chinese and Syriac, and dated 827 A. D., recording the establishment of Christianity in this neighborhood by the Nestorians in the fourth century. See Yule's *Book of Ser Marco Polo* (3d ed., 1876). R. L.

Singapore: an island at the extremity of the Malayan Peninsula. It contains the town of Singapore, founded by the Malays 1283, ceded to the British by the Sultan of Johor 1819, and rendered a free port in order to strike a blow at the Dutch; became in 1833 the capital of the Straits Settlements (see map of East Indies, vol. 6-11). The area of the island is 297 sq. miles; the surface varies from 20 to 80 feet above the sea-level; low hills are numerous, varying from 50 to 200 feet; Bakensta, a hill in the center of the island, has a height of 517 feet. The climate is agreeable to Europeans; the mean annual temperature is 80° F.; during the day the heat is intense; the atmosphere is very moist, there being usually a fall of rain every week. The drainage of the town, formerly as bad as possible, has been considerably improved. The women's hospital is an excellent building, well adapted for its purpose and well attended to. The population of the island was 184,554 in 1891, of whom 121,508 were Chinese, 55,002 Malays, 16,003 natives of India, and 2,160 whites. The city was once a dreaded lurking-place for pirates, but developed into a great commercial center of the Malayan Archipelago, doing in 1891 a total business in native produce and foreign goods of \$232,490,724. Numerous harbors on the Malayan Peninsula, especially Pulo-Penang, in Borneo, in Sumatra, in Siam, and Cochin-China, formerly traded exclusively through Singapore, but afterward established direct communications. The city had 410,000 inhabitants in 1891. The port has excellent docks and is strongly fortified. It has considerable trade with the U. S., and is connected by telegraph with Madras, Java, Australia, and Japan. See STRAITS SETTLEMENTS. Revised by M. W. HARRISON.

Singh, RUMART: See RUMART SINGH.

Singhalose (the people and language of CEYLON (q. v.).

Single Tax: a term which has come into use since 1887 to denote the proposal, theory, or movement which aims at the collection of all public revenues from one single source, what in political economy is termed "rent," the value of land itself, irrespective of the value of any improvement in or on it; or, to adopt another form of statement, a proposal or movement which aims at the appropriation of economic rent, the "unearned increment of land values" to public uses, by means of taxation.

These two forms of statement, though often indiscriminately used, since the practical method of reaching the single tax from existing conditions is "to abolish all taxation save that on land values," are suggestive of two different points of view—the fiscal and the moral—that of governmental expediency and that of social justice. Although social justice must really include governmental expediency, the argument for the single tax may perhaps be most concisely put by presenting it first from the narrower and then from the wider of these standpoints.

From the fiscal side, the single tax offers the cheapest and in all respects the best mode of raising public revenues. Every owner of a valuable estate has the power of raising revenue from those who use it. He may, as was largely the custom of feudal landlords, require from his tenants a multiplicity of payments, conditioned on what they may do or have—as on the building or repairing of houses, the growing of crops, the engaging in certain occupations, the possession of certain amounts or forms of wealth, the bringing in or taking out of goods; or even on such occurrences as births, deaths, or marriages. But reason and experience both show that the largest revenue can be raised with the least trouble and expense by substituting for such small exactions one single charge or rent, and this has become the custom of enlightened landlords. Now the taxing power of the state is simply that of the superior landowner or "over-lord" of a certain area. It exists only within that area, and, as in the case of the individual landlord, is limited by what people are willing to pay for the privilege of living in it. For though the state still retains the power of seizure and punishment, which once belonged to the larger landlords (the "right of pit and gallows"—i. e. of life and death—having in Scotland been taken from them only in comparatively recent times), this avails nothing in the raising of permanent revenues. If taxes be imposed beyond a certain point in any given area, men will refrain from coming into it, those already there will leave if they can, and those who can not leave will become impoverished and finally starve and die. There are many instances of populous cities reduced to ruins and fertile districts to deserts by ill-laid and excessive taxation.

Thus the same principles that enable the individual landlord to raise the largest revenue with the least waste, cost, and trouble, by a single rent-charge, apply in the case of public revenues; and the common-sense way for the state or any of its subdivisions to obtain revenues is by a single tax on the value of land. The attempts of governments to raise revenues by other taxes are really as stupid and barbarous as would be the resort of an individual landlord to petty feudal exactions. Such taxes invite evasion, fraud, and perjury; they require an expensive array of tax-gatherers, and even then can not be fairly assessed or fully collected. They check production, lessen accumulation, and take from the people much more than the state receives. The waste involved in the more important of them is not merely in the expenses of trying to collect them and of trying to evade them. Taxes on imports, taxes on internal production or exchange, taxes on capital in any of its forms, nearly all license taxes, and all that part of real-estate taxes that rests on buildings and improvements do not really fall on those who pay them to the state, but with added interest and profits finally fall upon the ultimate user or consumer. These taxes are really of the nature of that most destructive of fiscal devices, the farming of revenue.

Since a tax on the value of land is not a tax on land, but on an advantage accruing on specially desirable land, which can in no case go to the land-user as user, it can not check production, or lessen the return from use or improvement, or be shifted from shoulder to shoulder, increasing in weight as it goes. Avoiding all the waste, loss, and fraud of indirect taxes, it also avoids the evasions and injustice that attend attempts to tax incomes of all kinds, and is of all possible taxes that which may be most cheaply, certainly, and equitably obtained. It can not be evaded. It must fall on the owner, wherever he may be, taking from him, not in

proportion to anything his labor or capital may have contributed to the general wealth, but only in proportion to the unearned income which the adjustments of the state give him the special privilege of receiving. Land can not be concealed or removed, and its value can be ascertained with greater ease and certainty than any other value. A small sign on each separate piece of land, giving boundaries, area, and valuation, would bring public knowledge and opinion to the aid and correction of the assessment, while under a proper system the collection would involve little more than the clerical labor of receiving. In the U. S., as taxes are levied on land-values for state and local purposes in the tax on real estate, and as the percentage needed for national purposes could be collected by the same system, the substitution of this one method of raising public revenues for the complicated system in use would involve no new machinery, but only the abolition of many offices and the great lessening of corruptive and demoralizing agencies.

From the Moral Side.—The perfection of the single tax as a fiscal measure does not, however, account for the rapid spread of the idea and the ardor it excites. These come from its moral side, in which it is apprehended as the easy, yet, under the conditions of the times, the only possible way of relieving undeserved poverty, establishing social justice, and avoiding that monstrous inequality in the distribution of wealth that is so rapidly developing destructive tendencies in modern civilization. The argument from this side may thus be briefly stated:

The equal right to land flows from the right to life, and is the corollary of the right of property, or exclusive right of the producer to the product. In the rude stage of social life, where a simple industry seeks to satisfy primary need from the spontaneous offerings of nature, the equal right to the use of land and the exclusive right to the products of labor are secured when all have free access to the land ranged over by the tribe, and each may dispose of what his efforts obtain. But as society begins to take settled form, the division of labor begins to separate occupations, and a higher use of land calls for the use of capital, social order, industrial necessities, and the recognition of the right of property, all require such exclusive possession of land as shall assure to him who plants that he may reap, and to him who builds that he may enter in. This need becomes wider as civilization advances and improvements become more costly and industry more complex.

But no matter how far civilization advances, the exclusive right of property need never interfere with the equal right to the use of land. For these rights are correlative, the one involving the other, and the denial of one being really a denial of the other. Thus to deny to a man his equal right to the use of land is to deny him the benefits of his own labor, and to compel him to yield that labor or its products without due return. So far from the right of property making it necessary to attach to land that right of ownership which by natural law attaches to things temporarily drawn from land by labor, such treatment of land is as truly a denial of the right of property as making property of men. Between chattel slavery, the rude method of appropriating labor, and industrial slavery, the more civilized method, the difference is only of form. In the one, the man himself is treated as the property of another; in the other, the land on which the man must live is treated as the property of another. The result in either case is robbery, and robbery that may go to the same pitch. To the chattel slave must be left enough of his earnings to support life. Are there not to-day in so-called free countries great bodies of men who think themselves fortunate to get this?

In the relations of individuals with each other we find no difficulty whatever in combining exclusive possession with equal rights to use. A man may leave a horse, a ship, a building, or anything else incapable of division, to his children or to others equally; or such equal rights may be acquired in daily transactions without difficulty being encountered. Where a right to use can not be divided, its value may. So the exclusive possession of land called for by social advance need involve no denial of the equal right to use. That equality may be secured in a way permitting the best use of land by requiring from him who is accorded exclusive possession of any piece of land a contribution to common uses equivalent to any advantage it gives over that obtainable from the best land that others are free to use. There is nothing new in this. The principle lay at the base of feudal tenures, and is applied partially in Chicago, where the equal right of the whole community to the use of a cer-

same piece of land now covered with very valuable buildings, the property of individuals, is recognized by the appropriation of the ground-rent to municipal expenses; and there are similar examples in many other cities. The special advantages attaching to the possession of any piece of land is always exactly measured by ground-rent, since it is what gives value to land itself. By taking that, and that alone, for common needs, the equal right to land and the exclusive right of property may both be secured in any stage of civilization, however advanced, and the society placed on the only enduring basis, that of exact justice between man and man.

Economic considerations and moral considerations both point to a complementary relation between the need for public revenues and the value of land. If we consider the appearance, growth, and direct cause of the two phenomena, the connection becomes irresistible; and the same recognition by which we see that the milk secreted in the mother's breast is intended for the sustenance of the babe shows us to what values the intended provision for public revenues.

In that primitive social condition in which land may be left to free access, the state exists only in the rudimentary form of patriarchal authority or an occasional council, and there is no need for regular public revenues. The division of labor, which is the mark and measure of civilization, does not yet require that some men shall devote themselves to public service; there are no courts or schools to maintain; no roads to make, no public buildings to erect; no streets to pave and clean and sewer; none of the public needs of civilization to provide for. In this social condition land has no value whatever, for land has no original value, such as attaches from the first to things produced by labor. But the same advance in civilization that brings the need for public revenue attaches value to land; and while, by lessening the cost of production, it tends steadily to lessen the value of products of labor, it as steadily tends to increase land-values. When a few self-contained families roamed over Manhattan Island there was no need for public revenue and no value to land. In New York to-day immense public expenses are needed to meet legitimate public wants, and land has such an enormous value that the most costly and towering buildings are not so valuable as the bare land they cover.

This we may see wherever civilization centers. The same social advance which by increasing public needs calls for larger public revenues, correspondingly, and even more than correspondingly, increases the value of land. The reason is that the integration of individuals, to which civilization consists, besides increasing the power of individual exertion to satisfy desires, develops in the society itself an additional power of satisfaction which tends to localization, not merely bringing out important differences in the original qualities that adapt land to the satisfaction of human desires, but, in places where exchanges center, attaching enormous value to mere standing-room. It is not only that all public improvements, material, political, and even moral, increase this "unearned increment"; it also grows by private improvement, for the erection of a beautiful dwelling, the opening of a good hotel, or well-appointed store, or of a mine or factory, or even improvement in the personal qualities or conditions which make people more desirable neighbors, localize an advantage that becomes tangible in land-values. The adoption of the single tax itself, while it would destroy speculative rent, would, by promoting general prosperity and so vastly increase the aggregate of economic rent, the value attaching to land itself.

"Rent" is not produced by land, which is but the passive factor in production; not yet is it produced by the landlord, who as landlord contributes no more to production than could a sunlord or air-lord. The active factor in all production is human exertion or labor, of which capital (wealth applied to further production) is a subdivision. In the most primitive form of industry the whole product goes to labor as wages. In the next higher form it is distributed between the economic terms labor and capital, in wages and interest; but in that still higher form of industry which comes as the point in social development when a value begins to attach to land, the distribution of the product is in wages, interest, and rent. This distribution is a matter of natural law, and there is no possible device of human law or of individual ingenuity by which rent can be made to increase wages or interest. If it be turned over to a selector or a capitalist, he becomes in receiving it a landlord; in that extent, and may at any time separate what he receives of it from what he receives as laborer or as capitalist,

for there is no true rent until, and so long as, some one stands willing to pay for the privilege of using land.

This economic rent, the "unearned increment," is a natural growth, born of civilization and increasing with its advance; belonging to the society itself as distinguished from its individual members, by the same right of property which gives to the individual the ownership of his product. It is the natural provision for the natural need of public revenues; a fund created by the social organism to meet the wants, analogous to those of the physical body for sustenance, which come with its definite appearance and grow with its growth.

To see this is to see more. For that civilization develops a fund belonging to the social all and not to the social each, shows that the wider and closer co-operation of man with his fellows, to which all increase in his knowledge and powers is due, should bring a greater and greater equality of condition, and thus that our highest moral perceptions are not mocked by, but correspond to, the design of that Originating Intelligence manifest in the phenomena of nature. Now good and evil lie not in things, but in their uses, whatever is potent for good being correspondingly potent for evil. Thus the neglect or perversion of the natural provision by which the advance of civilization tends to bring about a higher and higher equality in human conditions must turn that advance toward a more and more monstrous inequality.

In the perversion of the great law of rent lies the explanation of those threatening facts which threaten modern civilization to-day. Rejecting what rightfully belongs to it, the state is driven by its need for public revenues to ignore the moral right of property and to take what rightfully belongs to individuals, by taxes that necessarily fall most heavily on those least able to bear them, that check production, render distribution inequitable, foster monopolies, create artificial crimes, put a premium on fraud and perjury, corrupt government, and debauch morals. But worse than this: what the state refuses to take must go to mere land-owners, thus not only creating a class of idle rich, who become demoralized and demoralizing social factors, but by attaching a premium to the forestalling of land and developing speculative rent turn the very forces of invention and improvement which directly increase the productive power of labor into agencies which degrade and impoverish the laboring masses, by creating an artificial scarcity in the indispensable natural element of all production and all life.

This is why those who apprehend the single tax from the moral side see in it the only yet only possible way of saving our civilization from otherwise certain destruction, and turning its advance to nobler heights than have yet been more than dreamed of. To them the single tax means the abolition of all real taxes: the taking for society of the provision made in the natural order for its needs; the conforming of the most fundamental of all social adjustments to the moral laws of the Creator.

HENRY GEORGE.

Sing Sing: village; Westchester co., N. Y.; on the Hudson river, and the N. Y. Cent. and Hud. River Railroad; 31 miles N. of New York (for location, see map of the State of New York, ref. 8-J). Its streets and avenues, rising one above another to the height of from 200 to 300 feet, afford views of the lovely scenery of the Hudson. The river is wider at this point than at any other; the broad Tappan Zee and Haverstraw Bay are separated by the long peninsula known in Revolutionary times as Teller's Point (where the Vulture waited for Arnold and André), and now, as Croton or Underhill's Point, famous for its vineyards. The Croton aqueduct crosses the Kill brook by a magnificent stone arch of 88 feet span and 70 feet above the stream, and beneath this arched bridge is a second one for highway use. Among the articles manufactured here are porous plasters, pills, baking-powder, self-feeding cotton-gins, cotton-gin saws, gas and water pipes, steam-engines, files, wrenches, carriages, and sleighs. A soldiers' monument was unveiled here May 30, 1887. The village contains several churches, 4 boarding-schools for boys, 2 being under military discipline, a boarding and day school for young ladies, 5 public schools, several private schools, a public library (founded in 1838), 4 other libraries, one of the most noted prisons in the U. S., gas and electric lights, electric street-railways, a national bank with capital of \$100,000, a savings-bank with deposits of over \$1,579,000, and a monthly, a bi-monthly, and 2 weekly periodicals. Pop. (1880) 6,579; (1890) 9,832.

M. F. ROWE, EDITOR OF "REPUBLICAN."

Sinim: the name used in the Bible for the Seres, or ancient Chinese. See CHINA.

Sink-hole: a hollow of the land drained at the bottom. Districts underlain by limestone or gypsum are often drained through subterranean channels, and the surface waters find their way to these channels through vertical crevices which are sometimes opened out into shafts of some size. The washing of soil, etc., into such shafts usually produces a funnel-shaped cavity, and this is known in the U. S. as a sink-hole or limestone-sink, and in England as a swallow-hole. Such hollows are abundant in the great Appalachian valley, which is underlain by limestone from Pennsylvania to Alabama. The word sink is sometimes inappropriately applied to drainless hollows which receive the water of streams, and discharge it to the air by evaporation. See PLAYA.

G. K. GILBERT.

Sinking Fund: See FINANCE (*Public Loans*).

Sinnett, ALFRED PERCY: journalist; b. in London, 1840; the son of E. W. Sinnett, a journalist; joined the staff of the London *Globe* in 1859; afterward edited *The Daily Press* at Hongkong; returned to England in 1868; went to Allahabad, India, in 1871, as editor of *The Pioneer*; joined the Theosophical Society in 1879, and, returning again to England in 1882, expounded theosophy to the British public in two widely circulated volumes, *The Occult World* (1881) and *Esoteric Buddhism* (1883).

H. A. BEERS.

Sino'pe (Gr. *Σινώπη*, Turk. *Sinûb*): town; in Asia Minor, in the vilayet of Castamouni (see map of Turkey, ref. 4-G). Situated on a peninsula with a splendid harbor, it was the most important of the Greek colonies on the Black Sea. It was the capital of the kingdom of Pontus. Mithradates the Great was born here (134 B. C.). During the Middle Ages it belonged to the empire of Trebizond, and was captured by Mohammed II. (1470). In its harbor the Ottoman fleet was defeated with a loss of 4,000 men and twelve ships by the Russian admiral Nachimoff (Nov. 30, 1853). This event decided France and Great Britain to interfere, and brought on the Crimean war. The town is well fortified, and has an arsenal and shipyard. It exports dried fruits, fish, skins, nuts, and tobacco. Pop. (1889) 7,162, of whom 2,840 are Greeks.

E. A. GROSVENOR.

Sinters [loan-word from Mod. Germ. *sinter* < O. H. Germ. *sintar*: O. Eng. *sinder* (the spelling *cinder* due to influence of Fr. *cendre* < Lat. *cinis*): a general designation for mineral substances deposited as incrustations or porous and cellular masses from the waters of mineral springs. The principal kinds are siliceous and calcareous sinters. Some siliceous sinters are classed by Dana with the crypto-crystalline varieties of quartz. They proceed from waters containing silica itself in solution, or sometimes, doubtless, soluble silicates of bases which are decomposed by the carbonic acid of the air. The great mass of siliceous sinters are composed of hydrates of silica. Florite, michaelite, and geyserite are names that have been given to some of these. Calcareous sinters are also called calcareous tufas. They are similar in nature and origin to the material of STALACTITES (*q. v.*).

Sintra: See CINTRA.

Sinus: See FISTULA.

Sion, Mount: See ZION.

Sioot, or Siut: See ASSIUT.

Siouan (soo'an) **Indians**: that linguistic stock or family to which the "Sioux" and cognate tribes of North America belong. According to Trumbull, Sioux, the popular appellation of the tribes which call themselves Dakota, Lakota or Nakota, is an abbreviation of Nadowessiou, which is a corruption of Nadowe-ssi-wag, "the snake-like ones" or "enemies" (derived from the Algonquin word *nadowe*, a snake). The characteristic languages are eminently vocalic and abound in inflections; agglutination and juxtaposition are also found.

Tribes.—The family comprises a number of tribes commonly arranged in ten groups, as follows: 1. (A) *Dakota* and (B) *Assiniboin*. The former includes the six Dakota sub-tribes, (a) Santee, comprising the Mde-wa-ka-to-wa (Spirit-lake village) and Waqpe-kute ("to shoot among deciduous trees"); (b) Sisseton (Sisito-wa); (c) Wahpeton (Wa-qpeto-wa, "dwellers among deciduous trees"); (d) Yankton (Ihañkto-wa, "end village"); (e) Yanktonnai (Ihañkto-wa-na, "little end village"), divided into Upper Yanktonnai (including the Cut Head band or Pa-baksa gens) and Lower Yanktonnai; and (f) Teton (Ti-to-wa, "dwell-

ers on the prairie"), in seven divisions, namely, Brulé-Si-tea-xu, "burned thighs"), including Upper or Highland Brulé and Lower or Lowland Brulé; Sans Arcs (Ita zi-pes, "without bows"); Blackfeet (Sihasapa); Minneconjou (Mun-ko-oju, "planting beside streams"); Two Kettles (Oo-ho-no-pa, "two boilings"); Oglala (o-gla'la, "she poured out her own"), including the Wazaza and the Loafers (Waglu-xu, "inbreeders"); and Huñkpa (Uncapa or Uncapapa). The tribal organization of the Assiniboin is uncertain; they are called Hohe (rebels) by the Dakota. 2. *Dhegiha* (or *Cegiha*, consisting of the tribes known as (a) Omaha (Uma-ha, "upstream people"); (b) Kwapa or Quapaw (Uka'qpa, "downstream people," the Arkansa or Arkansas of early writers); (c) Ponka or Ponca; (d) the Osage (Wacaca, etc.), divided into Little Osage (Utséhta, "campers on the lowland"), and Big Osage (Pahe'tsi, "campers on the mountain"), and the "Arkansaw band" (Santsu'kei, "campers in a highland grove"); and (e) the Kansa (Kaw, Ka'ze, referring to the wind). 3. *Tciuere*, comprising (a) the Iowa (Pa'qote, "dusty noses" or "dusty heads"); (b) the Oto (Watota, "lovers of sexual pleasure"); and (c) the Missouri. 4. *Winnebago*, including only the Winnebago tribe (who call themselves Hotcañgara, "people of the parent speech"). 5. *Mandan*, consisting of the Mandan tribe. 6. *Hidatsa* (Minnetaree or Gros Ventres of the Missouri), consisting of (a) the Hidatsa and (b) the Crow (Absoroka or Absaruka, etc.) tribes. 7. *Tutelo* (Yesa), comprising the Tutelo, Sapona, and cognate tribes. 8. *Biloxi* (calling themselves Tanéksa-yadi, including the Biloxi and very probably the Paskagula or Paskagula tribes. 9. *Catawba* (Flatheads), comprising the Catawba, Woccon, and cognate tribes (f Eutaw, f Chickoree, f Nachees, etc.). 10. The "Virginia group," composed of the Mannahok, Monacan, and cognate eastern tribes and confederacies (mainly extinct).

Habitat.—Excepting the Biloxi, Paskagula, Tutelo, Sapona, Catawba, and Woccon tribes, the territory of the Siouan Indians was mainly in one body, extending from about 33° N. in the Hudson Bay Company territory to about 38° N. including a considerable part of the watershed of Missouri river and that of the upper Mississippi. The detached portion of Siouan territory on the E. was occupied by Catawba, Biloxi, etc. It comprised a portion of the present States of Virginia, North Carolina, and South Carolina. Contrary to current opinion, the general trend of Siouan migration has been westward.

General Characteristics.—The Dakota tribes were warlike. They were hostile not only to the white people and Indians of other families (especially the Ojibwa and Pawnee), but also to the Crow, Hidatsa, Mandan, Omaha, and other tribes of their own family. Many of the Dakota have come under the influence of Christianity, and are advancing toward civilization. The Omaha and the Ponka have been warlike, but they have never fought against the U. S.; this might be said also of the southern tribes of this family.

Sociology.—The civil and religious institutions are determined by kinship as expressed in terms of consanguinity and affinity. The unit of the social organization is the *gens*, which is usually characterized by one or more taboos. The religious and the legislative, executive, and judicial functions are not differentiated, being exercised by chiefs whose tenure of office is limited by age or other physical incapacity, or by misconduct. The chiefship descends from father to son, unless the ambition and influence of a near relative displace him. With some exceptions descent is in the male line, although the entire system of consanguinity and affinity bears traces of a period in which descent was in the female line. A plurality of wives is deemed essential to the amassing of wealth, which is one avenue to power; divorce is optional with the husband. Civil government, personal conduct, property rights, corporations or organized bodies of persons, war, and international relations are regulated by laws and compacts. Indirectly related to the civil government are two kinds of associations for religious, industrial, and other purposes, the first being the feasting organizations and the second the brotherhoods or dancing societies, to some of which the shamans belong. Murder and rape, as a rule, are punished or avenged by death at the hands of kindred of the victim.

History.—The Dakota were mentioned in the *Jesuit Relations* as early as 1639-40. In 1658 they had thirty towns. W. N. W. from the mission St. Michel of the Potawatami; in 1689 they were on the upper Mississippi near St. Croix river. In the nineteenth century the Teton Dakota went into the Black Hills region, previously occupied by the Crow tribe.

The Yankton and Yanktonai passed from the upper Missouri into the upper Missouri country prior to 1800. In 1809 and 1810 and other Dakota joined in a formidable uprising in which over 1,000 whites were killed. Spotted Tail, Red Cloud, Crazy Horse, Sitting Bull, American Horse, and Brown-Blackhorse (popularly called Man-afraid-of-his-horse) are among the most famous Dakota chiefs and warriors of the nineteenth century. An outbreak of serious pestilence was narrowly averted during the ghost-dance excitement at Pine Ridge agency in the winter of 1890-91. In all, over 100 Dakota are located in Canada and over 27,500 in the U. S., chiefly in North and South Dakota, Montana, and Nebraska.

Bismarck (1890) described the Assiniboin as dwelling S. E. of the Iowa (Manyah, Nankov, or Molewakantonian), who were on Knife Lake, Minnesota. The Jesuit map of 1681 placed them on Lake of the Woods, then called Lake Assinipouan. They were near this lake in 1760, when they were said to have 1,000 warriors. In 1829 they were W. of the Isarens and N. of the Missouri and Assiniboin rivers, with a population of 8,000. Drake (1848) numbered them at 10,000 before the smallpox epidemic of 1838; that epidemic carried off 4,000. Since 1843 they have been decreasing in numbers. In 1890 there were about 8,000, mostly in Canada; some 700 were at Fort Peck reservation, Montana.

According to tribal traditions, the Omaha, Ponka, Kwapo, Gage, and Kansa tribes were originally one people, dwelling on the Ohio and Wabash rivers. A separation took place as early as 1600, as it preceded de Soto's discovery of the Mississippi. Those who went down the Mississippi became the Kwapo, and those who went up the river the Omaha; the Ponka settled on Nebraska river. The Omaha subsequently occupied the country between Covington, Neb., on the N. and Omaha river on the S., ranging W. as far as the Ponka and Pawnee habitats. About the beginning of the nineteenth century they were near Omaha, Neb. In 1890 they numbered nearly 12,000. They are citizens of the U. S. and of Nebraska.

Although archaic, the name Ponka does not appear in history till 1790. The Ponka were met by Lewis and Clark in 1804, when they had been reduced by the smallpox to about 200. In 1829 they numbered 600; in 1842, 800; and in 1871, 747. Prior to that time they had been friends of the Dakota; but a cession of lands to the Sioux reservation made the tribes enemies. The warfare continued until the forcible removal of the Ponka tribe to the Indian Territory in 1877. A commission appointed in 1880 visited both settlements of the Ponka, and their investigations resulted in legislation in favor of the tribe. Those who agreed to remain in the South are said to be prospering. In 1890 they numbered over 600, while those in Nebraska numbered 217.

Two Kwapa were found in 1541 by de Soto on the Mississippi, above the St. Francis, apparently near the site of the present New Madrid. La Salle (1681) found them in three villages along the Mississippi. The earliest mention of "Arkans" is by La Metairie in 1682. Saint-Côme says the greater part of the Kwapa died of the smallpox in Oct., 1690. Griener (1791) mentions five villages, the Imaha (equivalent to Omaha in meaning), which he terms "the largest village of the Arkansas confederation," being the highest up the Arkansas, while Sidley (1805) says the Arkansas were in three villages about 12 miles above Arkansas Post. The Kwapa subsequently affiliated with the Caddo, though of another linguistic family. In 1877 the Kwapa were on their reservation in the Indian Territory, but most of them later removed to the Osage country. Their total number in 1890 was 202.

The Osage were mentioned by Marquette (1673) as the Ouchagay and Antrochaba. In 1820 Porter gave their number as 5,000, and described their country as beginning 25 miles W. of the Missouri line, running to the Mexican line of that date, being 30 miles wide. Schoolcraft said that in Apr., 1823, they numbered 3,788. In 1894 they were on the Osage reservation, Oklahoma; in 1890 they numbered 1,581.

After the cession of Louisiana to the U. S., a treaty with the Kansa tribe was made by the Government. They were then on Kansas river, at the mouth of the Saline, and numbered about 1,600, in 160 earth lodges. In 1825 they ceded their lands on the Missouri, retaining a reservation on Kansas river. In 1840 they again ceded their lands, and a reservation was assigned them on Neosho river, in Kansas. This was soon after sold, and a new reservation acquired in Indian Territory. In 1890 they numbered 214.

In 1761 Jefferys located the Iowa Indians on the east side of Missouri river, W. of the head of Des Moines river, above

the Oto and below the Maha (Omaha). Drake (1848) said that in 1805 they numbered 800, and dwelt 40 leagues up Des Moines river, on the southeast side. Part of the Iowa afterward removed to the Sac and Fox reservation in what is now Oklahoma, but the rest remain on the Great Omaha reservation, Kansas. Their number in 1890 was 273.

The Oto was the third tribe to separate from the Winnebago, the Iowa being the first, and the Missouri the second. In 1673 they were placed by Marquette between 40° and 41° N. lat., W. of Missouri river, E. of the Maha (Omaha) and S. E. of the Pans (Pawnee or Ponka); in 1690 they were 130 leagues from the Illinois, almost opposite the mouth of Miskonging (Wisconsin) river; and in 1697 they were on Osage river. Irberville (1790) located the Iowa and Oto with the Omaha, between Mississippi and Missouri rivers, about 100 leagues from the Illinois tribe. In 1823 Catlin found the Oto and Missouri together in the Pawnee country. In 1894 they were with the Missouri on the Ponka, Pawnee, and Oto reservation, Oklahoma. Together with the Missouri, they numbered nearly 400.

The name Missouri first occurs about 1687. Their village was placed by Bourgmont (1733) 80 leagues below Kansas river, and 60 leagues below the principal Kansa village. The tribe formerly dwelt at the mouth of Missouri river, but gradually ascended that stream. About 1798 or 1800 they were dispersed by the Sac and Fox and other Indians; five or six lodges joined the Osage tribe, two or three took refuge with the Kansa, and most of the remainder amalgamated with the Oto. In 1803 Lewis and Clark found the Missouri in villages S. of Platte river, numbering 300 souls. They were with the Oto in 1829, when they numbered 20, and followed them to Indian Territory in 1852.

The Winnebago are closely related to the Iowa, Oto, Missouri, and Mandan. The earliest mention of the name is in the *Jesuit Relations* of 1640. Nicolet found them on Green Bay, Wisconsin, in 1650. Kelton says that they derived their popular name from their former residence on Winnebago Lake, called by the Algonquin tribes near it *Winibi*, dirty water. In 1811 Pike named seven Winnebago villages. In 1822 the Winnebago population was estimated at 5,900, with 900 warriors. By treaties in 1825 and 1832, they ceded all their land S. of Wisconsin and Fox rivers for a reservation on the Mississippi above the Osage. Out of their villages in 1832 was at Prairie la Poudre. During their third visitation of smallpox, in 1836, more than one-fourth of the people perished. In 1837 they relinquished their title to the country E. of Mississippi river, and in 1840 removed to the Territory of Iowa. In 1846 they surrendered their reservation for one above Minnesota river, and in 1850 removed to Blue Earth, Minn., and thence to a new reservation on the Omaha lands above Fort Randall, where they occupy lands allotted in severalty. In 1890 there were 1,215 here, with nearly 1,000 elsewhere, chiefly in Wisconsin.

The Mandan settled about 1750 on Missouri river, near the mouth of Heart river, in nine villages; they afterward ascended the river to a point 1,430 miles above its mouth. In 1837 the Mandan were almost destroyed by the smallpox, there being left only thirty-one (according to one account, though others vary from 125 to 145) out of 1,600. About 1872 a reservation was set apart for the Mandan, Hidatsa, and Arikara, in Dakota and Montana, along Missouri and Yellowstone rivers. In 1890 the Mandan numbered 262.

The Hidatsa were formerly known as the Minnetaree or Gros Ventres of the Missouri, and so were often confounded with the Minnetaree or Gros Ventres of the Plains, or the Arikara, of the Algonquian family. In 1796 there were three villages of this tribe on Knife river, in what is now North Dakota. The largest, Hidatsa, gave its name to the tribe. After the smallpox epidemic of 1837, the villages united. In 1845 the Hidatsa tribe (and about the same time the Mandan) moved up the Missouri and established a permanent village 20 miles by land and 60 by water from their old home. They were joined by the Arikara in 1862. In 1890 the Hidatsa on Fort Berthold reservation numbered 522.

The real name of the Crow tribe, which is Apsaroka or Absaruga (Hoffman), does not mean "crow," but refers to a species of hawk. When met by Lewis and Clark the Crow were in four "bands." In 1817 Brown located them on Yellowstone river. The Indian *Report* of 1842 gave their number as 4,000, inhabiting the head waters of the Yellowstone. They were later gathered on the Crow reservation, Montana, and in 1890 numbered 2,287.

The Tuto or Yoes was the leading tribe of the seventh group of Siouan Indians. To this group belonged the

Sapona and probably the Occaneeche or Akenatzy, Keyauwee, Shoccorie, Stenkenock, and Meipontsky tribes. The Tutelo were first referred to by Capt. John Smith. They were in Southern Virginia in 1671, according to Batt; in North Carolina in 1714, according to Lawson. They and the Sapona returned to Virginia, and in the eighteenth century, with the Nottoway and Meherrin, migrated into Pennsylvania and subsequently joined the Six Nations. At the close of the Revolutionary war the Tutelo followed the Six Nations into Canada, settling on Grand river reservation, Ontario. The tribe was nearly exterminated by smallpox in 1848, and the last survivor died in 1870.

In 1669 the Biloxi had one village on Biloxi Bay, near the Gulf of Mexico; thirty years later there were three villages, Biloxi, Paskagula, and Mactobi. In 1804 the Biloxi were on Red river, and in 1828 they were reduced to twenty families on Neches river, Texas. In 1894 about twenty-five of the tribe survived in Lecompte, Rapides parish, La.

Of the Catawba tribes, those mentioned earliest were the Wateree and St. Helena, seen by Juan Pardo's expedition in 1567. In the earlier part of the next century the Catawba proper (who were called Flatheads) were on Catawba creek, in Botetourt co., Va., and may have occupied the adjoining county, Roanoke, where there is now a settlement bearing their name. About 1660 they migrated to South Carolina. Lawson (1701-02) spoke of the Kataba on Catawba river, South Carolina, as Esaw, and distinguished them from the Kadapaw on Lynchess creek. Adair states that in 1743 the Catawba had 400 warriors; Ramsay (1795) that in 1780 they numbered 490 with 150 warriors. In 1780 they withdrew before Cornwallis to Virginia, where some of them joined the American army, returning to establish themselves in two new villages. About 1841 they sold to the State of North Carolina 14 sq. miles of their territory, reserving only 1 sq. mile and a tract of land on the east side of Catawba river. At that time, as also in 1890, they numbered about 120.

The Mannahock confederacy of Virginia consisted of about a dozen tribes, of which the names of eight have been preserved. Their habitat was between tide-water and the Blue Ridge. Of the Monacan confederacy of Virginia five tribes were named by Capt. John Smith, Lederer, and Jefferson. Both confederacies are extinct.

For a description of the manners, customs, etc., of the Siouan Indians (with others), see INDIANS OF NORTH AMERICA.

Ethnology, 1894); *Indian Linguistic Families*, by J. W. Powell (in 7th Ann. Rep. Bur. Am. Ethnology); *Information respecting the Indian Tribes of the United States*, by H. R. Schoolcraft.

JAMES OWEN DORSEY.

Sioux (soo) City: city; capital of Woodbury co., Ia.; at the junction of the Big Sioux and Missouri rivers; on the Chi., Mil. and St. P., the Chi., St. P., Minn. and Om., the Ill. Cent., the Sioux City and North., the Sioux City and Pac., the Sioux City, O'Neill and W., and the Union Pac. railways; 80 miles S. of Sioux Falls, S. D., and 100 miles N. by W. of Council Bluffs (for location, see map of Iowa, ref 4-C). It is the second city in size in the State, has a large frontage on the Missouri river and a picturesque residence quarter on high bluffs, and is an important commercial center. It is the gateway to South Dakota, the upper Missouri region, and the Black Hills mining and grazing country.

Public Interests.—The city has all the modern improvements: water-works (cost \$1,000,000); 51 miles of electric and 8 miles of elevated railway; gas and electric lights; over 40 miles of sewers; 25 miles of paved streets; city-hall and public library (cost \$80,000); police building (\$30,000); county courthouse; U. S. Government building (\$250,000); Y. M. C. A. building (\$60,000); 2 hospitals; a Union dépôt (\$600,000); and a bridge across the Missouri river (\$1,000,000). There are over 40 churches, several of which cost from \$50,000 to \$75,000 each; 30 public-school buildings (cost over \$650,000), including a high-school building that cost \$130,000; the University of the Northwest, and 3 daily and 13 weekly papers.

Business Interests.—The census returns of 1890 showed

195 manufacturing establishments (representing 50 industries), with a combined capital of \$4,938,606, employing 2,997 persons, paying \$1,862,612 for wages and \$10,329,994 for materials, and turning out products valued at \$14,164,667. In 1895 there were 5 meat-packing houses with a capacity for slaughtering and packing 13,000 hogs, 3,000 cattle, and 1,600 sheep per day. Over \$6,000,000 was invested in manufacturing. The principal productions were stoves, engines, shoes, flour, soap, starch, wagons, plows, tile, brooms, furniture, and clothing. The jobbing trade amounts to about \$30,000,000 per annum. There were 17 banks of all kinds, having a combined capital of \$3,575,000 and a surplus of \$940,000, and 2 loan and trust companies.

History.—The city was settled by traders in 1849, was an important Government post during the early Indian troubles, and was the outfitting point for the Black Hills expeditions. It achieved great fame from its corn palaces, beautiful structures decorated with grains, grasses, and other products of the soil. Five were built, in which annual fairs and festivals were held, lasting a month. Since the palaces were abandoned annual interstate fairs have been held at Riverside Park, a beautiful retreat in the suburbs, with ample grounds and a race-track.

Pop. (1880) 7,366; (1890) 37,893; (1895) estimated, over 40,000. ORA WILLIAMS, MANAGING EDITOR OF "JOURNAL."

Sioux Falls: city (incorporated as a town in 1877, as a city in 1888); capital of Minnehaha co., S. D.; on the Big Sioux river, and the Burl., Cedar Rap. and N., the Chi., Mil. and St. P., the Chi., St. P., Minn. and Om., the Great N., and the Ill. Cent. railways; 90 miles N. of Sioux City, Ia. (for location, see map of South Dakota, ref. 7-G). It is in an agricultural and stone-quarrying region; has large stock-raising interests; derives great power from the river, which falls nearly 100 feet in a series of cascades within a distance of half a mile; and contains water-works, sewers, and gas and electric-light plants. The streets are paved with jasper, quarried near the city, and many buildings are constructed with the same stone. There are 30 churches, 7 public-school buildings, public-school property valued at over \$175,000, Sioux Falls University (Baptist), All Saints' School (Protestant Episcopal), a Norwegian-Lutheran college, a business college, the State School for Deaf Mutes, the South Dakota penitentiary, 4 national banks with combined capital of \$450,000, 3 State banks with capital of \$200,000, and 2 daily, 7 weekly, and 3 monthly periodicals. Sioux Falls is the seat of the Protestant Episcopal bishopric of South Dakota and of the Roman Catholic bishopric of Sioux Falls. Pop. (1880) 2,164; (1890) 10,177; (1894) 13,564.

CHARLES M. DAY, EDITOR OF "ARGUS-LEADER"

Siphon [from Lat. *si'pho*, *sipho'nis* = Gr. *σίφων*, reed, pipe, tube, siphon]: a bent tube for conveying water from a reservoir, A, to a lower level, C, over an elevation, B, which is not more than 33 feet higher than A. To put the siphon into action the air must be exhausted, and then the atmospheric pressure on the surface of the water at A causes the water to rise and flow over, with a velocity depending upon the difference of level between A and C. The siphon is used for emptying casks, and sometimes on pipe-lines for water-works, but in the latter case a pump is placed at B, in order to remove the air which otherwise accumulates there and diminishes the flow. See HYDRAULICS. M. M.

Siphonap'tera [Mod. Lat., from Gr. *σίφων*, tube + *ἄπτερος*, wingless]: an order of insects which contains the fleas. See ENTOMOLOGY.

Siphonap'ta [Mod. Lat., deriv. of *sipho* = Gr. *σίφων*, tube]: one of the two divisions into which the lamellibranch molluscs (clams, etc.) were formerly divided, the name being given in allusion to the fact that the posterior edges of the mantle were united with a tube (familiar in the so-called "head" of the common clam). See LAMELLIBRANCHIATA.

Siphonoph'oræ [Mod. Lat., from Gr. *σίφων*, tube + *φάρος*, bearing]: a group of HYDROZOA (q. v.) characterized by the formation of free-swimming colonies, the individuals of which have become highly differentiated. These individuals are each modified jellyfishes, and are connected by a tube, whence the name. In a typical form the following individuals may occur: (1) A float, to suspend the colony, occurring

at the end of the tube; (3) swimming-bells; (4) feeding polyps; (5) digestive polyps; (6) reproductive polyps; (7) sensory polyps; (8) tentacles; (9) covering scales, which cover and protect some of the others. Of these the swimming and reproductive individuals retain most clearly the median features. Usually one or more of the individuals may disappear, while in many forms the tube may be contracted into a disk. The siphonophores, of which there are many species, vary greatly in size and appearance. Some are but an inch or two in length, while others are 2 yards or over. Some are perfectly transparent and colorless, while others (e. g. *Physalia* and *Valoniopsis*) are brilliantly colored with blue, red, and green. Many of the species are armed with powerful batteries of nettle-cells, and contact with them will cause severe pain to man. Most of the species inhabit tropical seas. See Haeckel, *Zoological Reports of the Challenger Expedition*, vol. XXIII (1889), and papers by Gegenbaur, Huxley, Dana, and Peckol. J. S. KIRKMAN.

Siphonostomata: See Ctenophora.

Sipunculærea, or **Sipunculidea** [Mod. Lat., named from *Sipunculus*, the typical genus, from Late Lat. *sipunculus*, for Lat. *siphunculus*, dimin. of *siphon*, *siphonia*, tube. See Siphon]: a group of marine worms in which the body is usually elongate and cylindrical, without traces of segmentation, and without bristles or other appendages. The mouth is at the anterior end of the body, and this region can be invested into the rest by the action of retractor muscles. The mouth is usually surrounded by tentacles. Internally, all traces of segmentation are lost, and the viscera are suspended in an extensive body-cavity. The intestine is usually coiled upon itself, and the vent is dorsal, near or in front of the middle of the body. There are one or two excretory organs (nephridia), and the genital products, which arise at the origin of the retractor muscles, and which are set free in the body-cavity, pass out through the nephridia. A circulatory system is well developed, and the tentacles subserve respiratory purposes. There is a metamorphosis in development, the larva being strikingly like that of the true annelids. These worms burrow in the sand or inhabit tubes, dead shells, etc. Over 100 species are known. See Sarsen, *Sipunculidae*, in *Saunders's Philippine Reise* (1889); Andrews, *Qual. Sipunculina*, *Studies Johns Hopkins Laboratory*, iv. (1890); Haeckel, *Entwickelung*, in *Arbeiten d. Inst. Zool. Wiesn*, v. (1884). J. S. KIRKMAN.

Sirbonian Bog, or **Sirbonic Lake**: formerly a long, narrow body of water, separated from the Mediterranean by a low strip of shore, and extending eastward from Pelusium in Egypt. It is now dry and covered with sand. At the beginning of the Christian era Strabo (*Geogr.*, i. 3, 4) spoke of it as a marsh, and just previously Diodorus reported that it was overgrown with reeds and papyrus. These statements do not agree with the further statements of Strabo (*op. cit.*, 2, 68, and 43, 43) that it was a deep body of heavy water into which one could not dive, and that asphalt or bitumen rose to the surface near the middle of it, whence it was gathered by men on rafts. One of the principal routes to Damascus along the narrow neck between sea and lake, but it was dangerous at certain states of wind and tide. Artabanus is said to have lost a part of his army when attempting the passage. The route of the Exodus proposed by Brunsch included the crossing of the bog by the Israelites, but the discovery of the site of Pithom overthrew his theory by locating the initial stages of the itinerary about midway of the pathos. CHARLES R. GILBERT.

Sir-Darya: See Sir-Darya.

Sire'don [Mod. Lat., from Gr. *sirēnē*, late collateral form of *sirens*, *siren*: a name at first applied to the axolotl of Mexico, but now extended to include the large larva with external gills of several species of salamanders belonging to the genus *Amblystoma*].

Siren [Mod. Lat., from Gr. *sirēnē*, *siren*]. So named because supposed to have a singing voice: a genus of tailed amphibia of the southern parts of the U. S. The only species is *Siren lacertina*, the mud-eel of the Carolina rice-swamps. It has two weak fore legs, no hind limbs, permanent gill-slits, as well as lungs, is 2 feet long, and black. It is considered venomous by the Negroes. *Pseudobranchius* affines to a smaller but very similar animal.

Sirene: See Acrotheria.

Sire'nia [Mod. Lat., from Gr. *sirēnē*, *siren*]. So called from a fancied resemblance of the dugong to the fabled sirens: an order of mammals, containing species familiarly

known as manatees. They are adapted for habitual life and progression in the water, but less modified than the cetaceans. The form is fish-like, the skull short and broad small in proportion to the body; front limbs are present as flippers, hind limbs are absent; the body ends in a transversely flattened tail, which may be rounded, as in the manatee, or, as in the dugong, forked like the flukes of a whale. The brain essentially resembles that of the higher mammals, but is notable for the compression and elevation of the cerebrum, the upturned bulbous olfactory nerves, and the depression of the cerebellum. Molar teeth, adapted for the trituration of herbages, are in the sides of both jaws; the neck is moderate, and the second vertebra has a distinct odontoid process; the heart is deeply fissured between the ventricles. The species are all herbivorous, and feed upon the vegetation growing on the banks of estuaries and rivers, as well as seaweed. When at rest they remain upright from the bottom of the water by their tail, but with the head downward, and the back consequently arched; at intervals of about one minute to one minute and a quarter they rise to breathe, and the valves of the nose open and shut as they come to the surface and go downward again. The order is now represented by two families—*Trichechidae*, including the manatees, and *Hydrochidae*, containing the dugongs. Up to the end of the eighteenth century a third family (*Albirochidae*) existed in the North Pacific (Bering Sea), but its only living species was in a short time exterminated by the attacks of man. The earliest extant representatives of the order yet known are of Eocene age, and since then several peculiar forms have flourished and died out. See DODD and NARAYAN. Revised by P. A. LUDAN.

Sirenoidea: same as DRYOS (q. v.).

Sirens [plur. of *Siren* = Lat. = Gr. *Sirēnē*, plur. of *Sirēnē*, the Sirens]: in Grecian mythology, maidens who lived on an island between Scylla and the island of Circe, and by their ravishing songs charmed mariners to their ruin, for whom heeded their singing saw not wife nor home again. It was fated that the Sirens should die as soon as any one should pass by without heeding their singing. Odysseus escaped their allurements only by stuffing his companions' ears with wax and having himself securely tied to the mast. The Argonauts escaped them because they were charmed by the superior singing of Orpheus. The Sirens were changed for one reason or the other to sunken rocks located at Pelorus, or Sorrento, or Capri, or the Sirens. In earliest times they were represented as birds with the heads of maidens, and later as creatures with the body of a maiden and the legs and wings of a bird. J. R. S. STRECHT.

S'rius [= Lat. = Gr. *Sirius*]: the dog-star, a star of *Canis major*, the brightest star in the heavens. It may be seen in the S. in the winter evenings. From the expressions of several ancient writers it is sometimes claimed to have been red in ancient times, though now a brilliant white, but the question of its former color is not yet settled. It was formerly believed to exercise a powerful and, to some extent, a baleful influence upon human affairs.

Revised by S. NEWCOMB.

Siro'co [= Ital., from Arab. *sharq*, deriv. of *sharq*, sunrise, east, deriv. of *sharq*, rise; cf. *SARACUS*]: a hot, relaxing wind which rises in the Sahara, then blows across the Mediterranean, where it occasionally becomes filled with moisture, and finally over Sicily, Southern Italy, Malta, etc. It generally occurs in spring and autumn, lasts for one or two days, though sometimes for a whole week, and is very injurious to vegetable and animal life, causing general exhaustion, great prostration, and mental depression.

Sisal' Hemp [named from *Sisal*, a port of Yucatan]: the fiber of various species of *Agave* (q. v.). Sisal hemp is produced in considerable quantities in Yucatan and at Key West, Fla., and adjacent islands. It makes excellent cordage, superior to that of true hemp, but it is chiefly made into hammocks of great strength and durability.

Sis'co, or **Cisco**: any one of several fishes of the genus *Osmerus*, natives of the Great Lakes of North America. The principal species are the *C. arctici* (also called herring) and the *C. hoyi* of the deep waters of Lake Michigan. They are recognizable by their herring-like form, terminal mouth, with the lower jaw longest, short interopercular bones, and the long and narrow suborbital bones. They are small, rarely weighing as much as a pound. The *C. arctici* inhabits the shallower waters. It is in some places exceedingly abundant.

Sis'cowet, Siskowit, or Siskawitz [from native (Amer.-Ind.) name]: a variety of the great lake-trout (*Salvelinus namaycush*, var. *siskawitz*), found in Lake Superior. It is similar to the namaycush, but is less elongated, and becomes extremely fat.

Sisen'na, LUCIUS CORNELIUS: historian; b. about B. C. 119; was prætor B. C. 78; defended Verres in 70, and died B. C. 67 in Crete, being at the time legate of Pompey in the war with the pirates. Having been an actor in public affairs, he was well fitted to relate the events of his own time (including the Social war and the civil wars of Sulla) in his work entitled *Historiæ*, written in an archaic style. Cicero says of him (in his book on *Laws*) that he surpassed all previous Latin historians, and Sallust highly praises his diligence. Sisen'na translated also into Latin the Milesian tales (*Μυληνιακά*) of Aristides. Whether the Sisen'na who wrote commentaries to several plays of Plautus is the same is disputed. Only fragments of the *Historiæ* remain, collected by Peter in *Hist. Roman. Fragmenta*, pp. 175-189.

Revised by M. WARREN.

Siskin [from Dan. *siegen*, or Swed. *siska*; Germ. *zeisig*, from Sloven. *žizek*: Polish *tyż*, siskin]: an Old World bird, *Spinus* or *Chrysomitris spinus*, of the family *Fringillidae*. The male is a prevailing olive green above and yellowish white below, streaked with black on the back and sides, and with a black throat and crown. It is a favorite cage-bird. The pine-siskin (*S. pinus*) and the American goldfinch are related North American species.

Sismon'di, JEAN CHARLES LÉONARD SIMONDE, de: historian and political economist; b. at Geneva, Switzerland, May 9, 1773; educated in the college of his native town, and was a clerk in a large counting-house in Lyons; political disturbances drove his family into exile, and he lived in England and later in Italy for several years; settled finally in his native town in 1800; devoted himself to studies and literary work, though at the same time participating very actively in politics; married in 1819 an English lady. D. near Geneva, June 25, 1842. His first work was a treatise on political economy, *De la Richesse commerciale* (1803), based on the ideas of Adam Smith, which, however, he afterward abandoned, and even opposed, in his *Nouveaux Principes d'Économie politique* (2 vols., 1819) and *Études sur les Sciences sociales* (8 vols., 1836). His acquaintance with Madame de Staël, Benjamin Constant, Guizot, etc., turned his attention from political economy to history, and it was as an historian that he acquired his great celebrity. His *Histoire des Républiques italiennes du moyen âge* (16 vols.) appeared at Zurich in 1807-18; *La Littérature du Midi de l'Europe* (4 vols., 1813) was translated into English by Thomas Roscoe in 1823. Of his principal work, *Histoire des Français* (31 vols., 1821-44), he gave an abstract, *Précis de l'Histoire des Français* (2 vols., 1839). See *Sismondi, Fragments de son Journal et de sa Correspondance avec Mlle. de Sainte-Aulaire* (1863), *Lettres inédites à Madame d'Albany* (1864), and another collection of *Lettres inédites* (1878).

Sistan: See SEISTAN.

Sisterhoods: in the religious sense, unions of women devoted by public vows to religious work. They are in idea nearly as old as monasticism, for female branches of all the principal monastic orders were organized by the original founders, whose members are called nuns, and are technically spoken of as female religious. A distinction should be made, however, between a sister and a nun, for the former, unlike the latter, is not shut up in a convent, nor given up to contemplation and ascetic practices. Sisterhoods in the strict sense are modern, for the first one, still the most famous of all, was founded by St. Vincent de Paul in 1629, and is known variously as Daughters or Sisters of Charity, Gray Sisters, and Sisters of St. Vincent de Paul. (See article CHARITY, SISTERS OF.) There are now many sisterhoods, all doing similar work. One of them, the Irish Sisters of Charity, founded in 1815, uses an adaptation of the Jesuit rule. The vows of all are the monastic ones of poverty, celibacy, and obedience. To these are added, in some cases, other obligations. The sisters wear a distinctive dress, and have houses to live in and start from on their daily round of labor.

Protestant women, although equally devoted to the relief of suffering, do not, as a rule, favor sisterhoods. They prefer to work independently. Besides, they resent the implication of the vow as to "chastity," that the married relation

is in any sense derogatory, instead of being in every respect an honor and glory to woman, and that it is a hindrance to spiritual life, whereas it is a divinely ordered help. Protestant sisterhoods date from the revival of what is called "Catholic" teaching in the Church of England. The first sisterhood in the Church of England was founded by Dr. Pusey in 1845. The Society of the Holy Trinity was founded at Devonport in 1847, and many others have since been organized. One of the largest is Sisters of the Poor, founded in 1851. The saintly Sister Dora (Dorothy Pattison, 1832-78) belonged to the Sisterhood of the Good Samaritans.

The first Protestant sisterhood in the U. S., the Sisterhood of the Holy Communion, was founded by Rev. Dr. W. A. Muhlenberg in New York in 1852. It took charge of St. Luke's Hospital in that city in 1859, and St. Johnland in 1866. The Sisterhood of St. Mary was founded in New York in 1865. There were in 1895 nineteen sisterhoods in the Protestant Episcopal Church, four being branches of English ones.

The Protestant sisterhoods differ somewhat in methods and objects, but agree in promoting a combination of piety and good works. They pay particular attention to the inner life, and strive to put the spiritual force thus gained to practical account. In dress their members resemble those in the Roman Catholic Church, except that they do not cover up the hair. They take vows, but not irrevocable ones, although it is very seldom that a woman leaves a sisterhood. For the allied order of Deaconesses, see DEACONESSES.

Sadlier's Catholic Directory (New York) annually gives the figures for the Roman Catholic sisterhoods in the U. S. and Canada, and the *Catholic Directory*, published in Dublin, those for Great Britain and Ireland. For the sisterhoods in the Church of England, see the yearly list in the *Kalendar of the English Church* (London). For those in the Protestant Episcopal Church see the *Living Church Quarterly* (Milwaukee, Wis.). On the general subject, see Mrs. Jamieson, *Sisterhoods of Charity* (London, 1855); Mary Goodman, *Sisterhoods in the Church of England* (1863; 2d ed. 1865); J. M. Ludlow, *Woman's Work in the Church* (1865); W. A. Muhlenberg, *Evangelical Sisterhoods* (New York, 1867); C. E. Stephen, *The Service of the Poor* (London, 1870); H. C. Potter, *Sisterhoods and Deaconesses at Home and Abroad* (New York, 1871); C. C. Grafton, *Vocation; or, The Call of the Divine Master to a Sister's Life* (1886).

SAMUEL MACAULEY JACKSON.

Sisters of Charity: See CHARITY, SISTERS OF.

Sisters of Mercy: a Roman Catholic religious sisterhood, founded at Dublin, Ireland, in 1827, by Miss Catherine McAuley. The rule is similar to that of the Presentation nuns. Originally each convent was independent, but offshoots from the parent house, especially outside of Ireland, are usually subject to it. These religious women are always under the jurisdiction of the bishop in whose diocese they are located. They were introduced into the U. S. in 1843, at Pittsburg. Their convents are more than 200 in number, and the sisters are chiefly occupied in the conduct of parochial schools, private academies, hospitals, and homes for the aged. See *Life of Mother Catherine McAuley, Leaves from the Diary of a Sister of Mercy*, and *Hoffman's Catholic Directory* for 1895.

J. J. KEANE.

Sisto'va: town and fortress; in Bulgaria, on the Danube, between Nicopolis and Rustchuk (see map of Turkey, ref. 3-D). It manufactures leather and cotton goods and carries on a large trade in wheat and wine. The treaty of Sistova was signed here between the Ottoman empire and Austria (1791), and the Russians crossed here in 1877. Pop. (1893) 13,212.

E. A. G.

Sis'yphus (Gr. *Σίσυφος*): in Grecian mythology, son of Æolus, father of Glaucus, grandfather of Bellerophon, and king and founder of Corinth. Because of his wickedness Zeus sent Death to take him to Hades; but Sisyphus bound Death and held him long time prisoner, so that no one died until Death was finally released by Ares. For this reason (though other reasons also are given) Sisyphus, when finally he had come to the house of Hades, was doomed to roll to the top of a high mountain a huge rock, which always broke away from him just as the top was being reached.

J. R. S. STERRETT.

Sit'ka (formerly NEW ARCHANGEL): capital of Alaska Territory, on Baranof island, near the Pacific coast, in lat. 57° 2' N. (see map of Alaska, ref. 4-H). It has a harbor that is deep and commodious, but is difficult of ingress and egress. It was founded by the Russians in the eighteenth

century, and was long the headquarters of the Russian-American Fur Company, but consisted, when transferred to the U. S. in 1867, of only about 100 log huts. Since then several large edifices have been built, and the presence of a detachment of U. S. troops until 1877 did much to contribute to the prosperity of the place. A noteworthy relic is the Greek church of St. Michael, built in 1816. The Presbyterian mission established an industrial school there in 1878; also a hospital and a warehouse. Pop. (1890) 1,108. Revised by M. W. HARRINGTON.

Sittidae (from *Sitta*, the typical genus): a family of birds containing the nuthatches. See **SITTARINAE**.

Sitting Bull (Indian name, TATANKA YOTANKA): Sioux chief and medicine-man; b. on Willow creek, Dakota, 1867; became the leader of the unruly members of his tribe, who resisted settlements of whites and small reservations of Indians—murdered whites at Spirit Lake, Iowa, and in Minnesota, 1882, and were driven by Gen. Sully into the Big Horn region and to the Yellowstone 1864. They were defeated in a battle on the Muclos Shell river 1885; were placed on a reservation in the Black Hills, from which they were driven by troops, 1879; refused to be transported to the Indian Territory; resisted and slew a party of troops under Gen. Crocker. On being pursued by Gen. Terry, Sitting Bull and many of his followers escaped into Canada. He surrendered on a promise of pardon 1880, and returned to Dakota, but continued in ferment trouble among the Sioux, and in 1890 the military authorities determined to arrest him. He was attacked Dec. 15 in his camp near Grand River, North Dakota, and during the fight that ensued was killed.

Sitot: See **ASITOT**.

Siva, or **Shiva** (Sanskrit, the gracious or blessed one): a Hindu god, mostly spoken of as the "Destroyer and Regenerator," the third member of the Hindu Trimurti or triad of divinities, of which Brahmā, the "creator," and Vishnu, the "preserver," are the first and second respectively. His agencies, however, under a great variety of names, attributes, and functions. As the Destroyer he is represented by Rudra. As the Regenerator or Repurifier his symbol is the linga or phallus, and under this he is now usually worshipped. (See **YOGA**.) He also represents the contemplative and ascetic side of Hinduism. He is represented as sitting absorbed in thought, naked, and smeared with funeral ashes, with matted hair, and wearing a necklace of human skulls and bones. He has three eyes, and fire from them consumes those who dare to interrupt his devotions. His worship is called *Nataraj*, or *Nataraj*, and his worshippers *Saivas*.

Sivas (anc. *Schadisa*, *Schadisa*): town; in Asia Minor, in the valley of Sivas, on the Kizil Irmak (see map of Turkey, vol. 4-6). Though situated in the center of an extensive and fertile plain at the juncture of natural routes, lack of roads nullifies these advantages, and the town is poverty-stricken and lifeless; hundreds of the natives work in distant places, above all in Constantinople, and thus support their families. It manufactures excellent carpets and woven and linen goods. Pop. (1890) 10,000, of whom 23,619 are Muslims and 14,439 Armenians. R. A. G.

Sivatherium [Mod. Lat.; Eng. *Siv*, L. *Civ*, the Hindu god + *Gr. tērion*, wild animal]: an extinct genus of ruminating animals from the Siwalik Hills, India, remarkable for their size and peculiar horns. *S. giganteum* nearly equaled the elephant in size, and was armed with two pairs of horns, a small pair springing from the anterior part of the head, and a much larger pair from the top. The bony cores of these horns, the only part preserved in the fossil state, show that these animals belonged to the hollow-horned type of ruminants. The front pair were divergent, apparently coarsely straight, and simple. The posterior pair were branching, and had at least three points. The American osteologist or prong-horn is the only living hollow-horned ruminant with branching horns. It is also the only one known to shed its horns. The posterior horns of *Sivatherium* seem to have closely resembled in structure those of the prong-horn, and may have been deciduous. The bones of the skeleton of *Sivatherium* were massive, like those of oxen. The nose was probably more or less movable, as evidenced by the short projecting nasal. Falconer and Cautley supposed the animal to have possessed a true proboscis, but Dr. Murray concludes from a study of the remains and a comparison with allied forms, that this nose was similar to that of the walrus of Tertiary.

Sivah (anc. *Ammon*, or *Ammonium*, Egypt. *Amun*): an oasis in Northwestern Egypt, 300 miles W. of Cairo, and

160 miles S. of the Mediterranean. Area, 9 sq. miles. The eastern part of the oasis is very fertile and rich in springs; in the northern part some limestone hills are found. In ancient times the place was celebrated as the seat of the temple of Jupiter Ammon, of which remains are extant, and of the Fountain of the Sun, whose waters were cold at noon and hot at midnight. The temple was immovably rich and guarded by strong fortifications. Cambyses attempted in vain to capture it. Alexander visited it, and was hailed by the priests as a son of the god. The Emperor Justinian built a Christian church here. The oasis is inhabited by about 3,000 Berbers and Negroes, who profess Mohammedanism, and speak a peculiar dialect much mixed with Arabic. The town of Sivah is in lat. 29° 12' N., lon. 35° 20' E., near the site of the ancient temple.

Revised by M. W. HARRINGTON.

Six Nations: See **IROQUOIS INDIANS**.

Six-principle Baptists: a sect of American Christians who take as their creed the six principles laid down in Heb. vi. 1, 2, viz.: (1) repentance, (2) faith, (3) baptism (of repentance, of fire, and of Christ's sufferings), (4) laying on of hands, (5) the resurrection, (6) the eternal judgment. They especially insist upon the laying on of hands, and refuse to commune with those who do not practice it. They are Arminians, and neither educate nor adequately support their ministry. They are found in Rhode Island, Massachusetts, New York, and Pennsylvania. They were first organized in 1852 by William Wickenden, Chad Brown, and Gregory Dexter, at Providence, R. I., and once composed the most numerous and influential section of American Baptists. In 1890 they reported eighteen organizations and 937 communicants. Revised by W. H. WERRITT.

Sixth: in music, an interval comprising five degrees of the diatonic scale. See **INTERVAL**.

Sixtus: the name of five popes. (See **POPE**.) **SIXTUS IV.** (Francesco della Rovere), b. 1414, entered the Franciscan order, attracted notice by his eloquence and learning, became the close friend of Cardinal Bessarion, through whose influence, it is said, he was chosen pope 1471. His pontificate was marked by munificence in founding and improving useful institutions, and in the patronage of arts and letters, but his nepotism caused great scandal, his conservatism in the Pazzi conspiracy against the Medici was most dishonorable, and the war with Florence which he entered into was inglorious for the Holy See and disastrous for Italy. D. in Aug., 1484. **SIXTUS V.** (Felice Peretti), one of the ablest of the Roman pontiffs, was born near Montalto, Dec. 16, 1521; entered the order of the Franciscans in 1544; became a teacher of canon law at Rimini and at Siena, acquired great reputation as a preacher, and became a cardinal in 1570. Arrived at this point, his ambition seemed to go no further. He was not anxious either to exercise influence on the papal government or to procure lucrative positions for his relatives. He lived quietly, and gave the impression of being a man easy to lead. After the death of Gregory XIII. (1585) the cardinals, thinking he would be a mild and indulgent pope, elected him to the Holy See, but to their astonishment he threw off all concealment of the natural energy of character, and at once began vigorous measures of reform. In all theological controversies he was cautious and tried to remain neutral. His great idea was to raise the papal see once more to its former splendor, and although his negotiations with the Emperor Rudolph II. of Germany and Stephen Báthori, King of Hungary, led to no permanent result, they show his ambition and his talent. He pronounced the ban upon Henry III. of France; and when that monarch was assassinated by the Dominican monk Jacques Clement he openly approved of the deed. The celebrated aqueduct Acqua Felice, the great dome of St. Peter's church, the obelisk in front of this church, and the library buildings of the Vatican, are among the public works that he successfully executed. He also suppressed the banditti, encouraged commerce and manufactures, and enforced the law in his states. He died suddenly at Rome, Aug. 27, 1590. See *Ranke's History of the Popes*. F. M. COCHRAN.

Sjöberg, *sjö bärj*, BARK (pseudonym *Vilhelms*): poet; b. in Södermanland, Sweden, Jan. 14, 1794. The son of a laborer, his life was a hard struggle with poverty and disease. He was a master of satire, and his ridicule of the excesses of the Pöplers had a wholesome influence upon Swedish literature. His style strongly resembles that of Byron. During the last years of his life he was a sincere Christian, and de-

voted himself to the study of Thomas à Kempis. D. at Upsala, Mar. 14, 1828. The complete works of Vitalis were published at Stockholm in 1878.

D. K. DODGE.

Skagerrak', or **Skager-Rack**: an arm of the North Sea, 80 miles broad, extending between Norway and the Danish peninsula of Jutland, and connecting the German Ocean with the Cattegat or Kattegat. The current generally sets E. along the coast of Jutland, where the depth varies between 30 and 40 fathoms, and W. along the Norwegian coast, where the depth generally is 200 fathoms. There is neither haven nor good anchorage on Jutland, but good harbors abound on the opposite coast.

Skaneateles, skān-ē-ā'lēez: village (settled in 1796, incorporated in 1833); Onondaga co., N.Y.; at the outlet of Lake Skaneateles; on the Skan. Railroad; 7 miles E. by N. of Auburn, 18 miles W. S. W. of Syracuse (for location, see map of New York, ref. 4-F). It is in an agricultural and teasel-growing region; derives good power for manufacturing from the lake; contains flour-mills, woolen-mills, iron-works, hydraulic lime-kilns, printing-paper mill, carriage-factories, Union School and Academy, public library (founded in 1877), a State bank with capital of \$60,000, a savings-bank, and two weekly newspapers, and is a popular summer resort. Pop. (1880) 1,669; (1890) 1,559; (1895) estimated, 1,700.

EDITOR OF "FREE PRESS."

Skate: a name given to certain species of fish of the family RAIIDÆ (q. v.). See also RAIDÆ.

Skeat, skēt, WALTER WILLIAM: clergyman and philologist; b. in London, England, Nov. 21, 1835; educated at King's College School and at Sir R. Cholmeley's school, Highgate; graduated at Cambridge University 1858; became a fellow of Christ's College 1860; took orders in the Church of England; curate 1860-64; became lecturer on mathematics at Christ's College Oct., 1864, and subsequently lecturer on English; was in 1873 one of the founders of the English Dialect Society. A prolific and useful writer and editor, he has published some forty works, among which are the following for the Early English Text Society: *Lancelot of the Laik, a Scotch Metrical Romance* (1865); *Parallel Extracts from 29 MSS. of Piers the Plowman* (1866); *The Romans of Partenay or Lusignan, otherwise known as the Tale of Melusine* (1866); *Pierce the Ploughman's Crede* (1867); *The Vision of William concerning Piers the Plowman* (3 parts, 1867-73); *The Romance of William of Palerne, or William and the Werwolf* (1867); *The Lay of Havelok the Dane* (1868); *The Bruce, by Master John Barbour* (part i., 1870); *Joseph of Aramathie, or the Romance of the Saint Graal* (1871); and Chaucer's *Treatise on the Astrolabe*. For several of these he prepared introductions, notes, and glossarial indexes. For the Philological Society he edited a *Mæso-Gothic Glossary* (1868), for the Oxford University Press 2 vols. of *Specimens of English Literature* and several of Chaucer's *Canterbury Tales*, and completed for the Cambridge University Press the variorum edition of the *Anglo-Saxon Gospels* left unfinished by John Mitchell Kemble. In a new edition of Chatterton's *Poems* he settled the question of authenticity by showing the precise sources of Chatterton's diction; is author of a *Hand-list of some Cognate Words in English, Latin, and Greek* (1871); *Questions for Examination in English Literature* (1873); an *Etymological Dictionary of the English Language* (1882); *The Principles of English Etymology* (2 vols., 1887-91); an edition of *Chaucer's Minor Poems* (1888); and *Complete Works of Geoffrey Chaucer* (6 vols., 1894).

Revised by BENJ. IDE WHEELER.

Skeleton [= Mod. Lat., from Gr. σκελετόν (sc. σώμα, body), dried body, mummy, skeleton, liter., neut. of σκελετός, parched, dried up, deriv. of σκέλλειν, dry, parch]: in its broadest sense, the structures serving to support and protect the more delicate tissues of the body of an animal. Among the invertebrates the skeleton is often represented by calcareous or siliceous plates or masses developed in connection with the integument, hence known as the exoskeleton, as distinguished from the more highly specialized supporting apparatus developed within the connective tissue as the cartilage or the true osseous substance which constitutes the endoskeleton. Ignoring the feeble attempts at the formation of a connective-tissue skeleton which are found among the lower animals, as the *Vermes* and the *Mollusca*, a true skeleton, composed of cartilaginous or osseous pieces forming a definite framework throughout the body, may be said not to exist except in vertebrate animals.

In addition to the endoskeleton, many vertebrates also possess in connection with the integument supplementary protecting structures which constitute an exoskeleton. Conspicuous examples of such structures are seen in the external skeletal plates of the sturgeon, the tortoise, or the armadillo. In other animals, again, a partial bony support is formed within the substance of certain organs, as, for example, the bony plates within the heart-walls of ruminants, the osseous rods within the tongue of certain lizards, or the slender bone within the male copulative organ of many carnivora, rodents, bats, and some monkeys. Such osseous structures occurring within the substance of the viscera constitute the splanchno-skeleton.

The first framework formed within the immature animal is the primary cartilaginous skeleton which is developed by the specialization of parts of the connective tissue of the embryo. This framework of cartilage in a general way outlines the bony skeleton, although much simpler than the latter in its details. Among the higher vertebrates the cartilaginous structures are only temporary, and after affording support to the delicate softer tissues of the developing organs for a limited time are replaced by the permanent bony skeleton. While such substitution is almost complete among the higher animals, some of the lower vertebrates, as the sharks, retain the primary cartilaginous framework throughout life as their permanent skeleton. Usually, however, after a time, at certain points called centers of ossification, the cartilage becomes invaded by true bone-producing tissue, and the substitution of osseous for cartilaginous structures is effected. For the details of the process of bone-formation, see the article HISTOLOGY.

Every vertebrate, whether fish, amphibian, reptile, bird, or mammal, possesses in the spine or vertebral column a fundamental axis in regard to which the remaining portions of the endoskeleton are symmetrically arranged. This axis is not necessarily bony in character, since in some fishes it never develops beyond the cartilaginous condition. In the lancelet, or amphioxus, it never attains even to the cartilaginous stage, but represents the primitive embryonic axis, the notochord. See EMBRYOLOGY.

The vertebrate axis is formed by a series of disks, the bodies of the vertebrae extending from the base of the skull to the caudal pole and including a variable number of segments, as few as fifteen or as many as 365. From this fundamental axis two series of very unequal dorsal and ventral arches extend. The dorsal arches are formed by the union of short vertebral plates—the lamina—which thus form a tube extending from the cephalic to the caudal pole of the animal. This tube is the vertebral canal and contains the spinal cord. At its anterior, or cephalic extremity, the tube usually widely expands into the cranial cavity containing the brain. The brain-case, or cranial portion of the skull, may be considered in a qualified sense as being composed of enlarged and modified vertebral segments. The dorsal or vertebral canal is distinguished therefore as containing and protecting the great cerebro-spinal nervous axis.

The ventral arches proceeding from the vertebral axis, on the other hand, are less constant, varying greatly in their number and position. The ventral arches are principally represented by the ribs, thoracic or abdominal, and by the variable series of branchial bows, or gill-arches, placed at the base of the head. The ventral arches inclose the thoracic and abdominal organs, affording them protection and support.

The osseous framework of man, in common with that of other high vertebrates, consists of two parts—the axial and the appendicular skeleton. The former includes the more constant and essential portions of the vertebrate framework, namely, the vertebral column, the skull and the ribs, with the breast-bone. The appendicular skeleton depends for its development upon the presence of limbs, since it includes the bones of the extremities, together with those forming the skeletal connection between the framework of the limbs and the spine. These connections are known respectively as the shoulder-girdle and pelvic girdle.

The shoulder-girdle in man consists of the collar-bone or clavicle, and the shoulder-blade or scapula, by means of which the bones of the upper limb are indirectly connected to the axial skeleton, an arrangement favoring the great latitude of motion enjoyed by the upper extremities. The pelvic girdle is much more fixed, consisting of the hip-bones or innominate, which give firm support to the thigh-bones and transmit the weight of the upper portions of the body. In animals, as the whales, where the hind limbs are wanting, the pelvic girdle, and hence the pelvis, is absent.

The individual osseous pieces composing the skeleton are so related that usually more or less extended movement is possible between the several bones. These latter are united by fibro-elastic bands—the ligaments—and the structures of the joints. The apposed surfaces of bones may be so inti-

The human skeleton.

mately united that only a thin membrane intervenes. This may undergo absorption at a later period, in which case the earlier distinct bones become fused and the original line of articulation disappears. The bones of the skull afford examples of such union, followed by the obliteration of former lines of contact of the sutures.

The more usual relation between the bones allows of a certain amount of movement, the surfaces of contact and motion being inclosed within the structures of the joints. The articulations at the shoulder, the elbow, the knee, and the hip afford striking examples of the wide latitude of movement enjoyed by the bones of the extremities. For the details of the joints, see articles *JOINTS* and *SYNOVIAL MEMBRANES*.

In addition to affording support and protection to the viscera and the organs of the body, the skeleton supplies the points of attachment for the numerous voluntary muscles. These latter, with very few exceptions, have at least one extremity, and more usually both ends, attached to portions of the skeleton, acting upon the more movable parts from the fixed points. The leverage afforded by the long bones of the skeleton is an important factor in many movements essential to the proper use of the limbs.

The exact number of separate bones composing the human skeleton varies with age, since many bones which at middle life consist of a single piece in early infancy are represented by several distinct segments, as instanced in the sacrum and innominate bones forming the pelvis. Again each fully formed bone in very many cases is the product of the fusion of several segments, which before maturity become united by the substitution of true osseous tissue for the layer of cartilage connecting the pieces. Thus the thigh-bone as found represents the fusion of at least five distinct segments, the union not being fully completed until about the seventeenth year. The adult human skeleton consists of 206 distinct bones, as follows:

The skull, including 22 vertebrae, the sacrum, and the coccygus	81
The ribs, 12 pairs, the sternum, and the hyoid	31
The scapulae, 2, together with the 6 ear bones	26
The upper extremities, each 27	104
The lower extremities, each 26	102

At birth their number is 278; at the age of twenty-five, 324; and in advanced old age, 104. About 600 segments are needed in the formation of the 206 permanent bones.

Notwithstanding the great diversity in size, shape, and proportions, the general groups of long, short, broad, and irregular bones suffice for the usual purposes of classification of the constituents of the skeleton. A description of the individual bones is contained in the article *OSTEOLOGY*, while their chemical composition and structural peculiarities are given in the articles *BONE* and *HISTOLOGY* respectively. See also *FIBRO*, *BANDS*, and *SEVERAL* *CHANGES*.

G. A. PIERCE.

Skeleton Leaves: See *CELASTRACEAE*.

Skelton, John; poet; b. probably in Norfolk, England, about 1455; graduated at Cambridge about 1492; was incarcerated at Oxford University about 1499; was ordained deacon 1499 and priest 1499; was tutor to Prince Henry (afterward Henry VIII.); held a nonresidential position at court, by some considered equivalent to king's poet, by others to post-laureate; became rector of Diss, Norfolk, and vicar of Trimpington, Cambridge, 1504; subsequently became royal orator; was suspended from his bench by the Bishop of Norwich, having concealed the fact of his marriage; incurred the resentment of his former patron, Cardinal Wolsey, by his satirical verses; was obliged to take sanctuary at Westminster, and died there June 21, 1529. Skelton was one of the earliest English poets whose writings are easily intelligible to modern readers. Most of his verses are coarse, but were highly esteemed by Erasmus and the wife of the day. His best-known poems are *Philip Spurne* and *Churl's Complaint*; he also enjoyed fame as a writer of Latin epigrams. The only good edition of his complete works is that of Rev. Alexander Dyce (2 vols., 1845). Revised by H. A. BEARS.

Skene, skene, ALEXANDER JOHNSTON CHALMERS, M.D.; gynecologist; b. in the parish of Fyvie, Aberdeenshire, Scotland, June 17, 1837; studied medicine at King's College, Scotland, the University of Michigan, and at Long Island Medical College, where he graduated in 1863; served as acting assistant surgeon in the Union army 1863-64; returned to Brooklyn in the latter year, and was appointed adjunct professor and instructor in medicine in Long Island Medical College; subsequently was appointed Professor of Gynecology in that institution, and for a time occupied the same chair in the Post-Graduate Medical School, New York. He is a member of various domestic and foreign scientific societies. His best-known works are *Diseases of the Bladder and Urethra in Women* (New York, 1878) and *Diseases of Women* (New York, 1888). S. T. ARMSTRONG.

Skene, PHILIP; soldier; b. in London, England, in Feb., 1725; entered the British army 1759; served in the taking of Portofello and Cartagena in South America, at the battles of Fontenoy and Culloden, and in the American campaigns against Ticonderoga and Havana; received in 1759 a large grant of land on Lake Champlain, and with a view to strengthening the hold of the British on Canada founded Skenesboro (now Whitehall), N. Y.; was made governor of Crown Point and Ticonderoga, with rank of colonel in the army; was arrested as a loyalist in Philadelphia June, 1775, and exchanged Oct., 1776; accompanied Burgoyne in his invasion of Northern New York; was taken prisoner at Saratoga; was attainted by the Legislature of New York 1779, his estate being confiscated; was granted a pension by the British Government, and spent the remainder of his life in England. D. near Stoke Goldington, Bucks, June 10, 1810.

Skene, WILLIAM FORBES, LL.D.; historian; b. at Inverurie, Kincardineshire, Scotland, June 7, 1809; educated at the High School and University of Edinburgh, also at that of St. Andrews, and in Germany; became a lawyer, a distinguished archaeologist, an officer of several learned societies; and in 1851 historiographer for Scotland. He was the author of *The Highlanders of Scotland, their Origin, History, and Antiquities* (2 vols., 1857), and editor of *The Dean of Lismore's Book, a Selection of Ancient Gaelic Poetry* (1861); *Chronicles of the Picts and Scots and other Early Memorials of Scottish History* (1868); *The Four Ancient Books of Wales* (2 vols., 1869); *The Pictish Stone* (1869); *John of Fordun's Chronicle of the Scottish Nation* (2 vols., 1871); and *Celtic Scotland* (3 vols., Edinburgh, 1876-80).

Skepticism: See *SCPTICISM*.

Skimmer, or Scissors-bill: any bird of the genus *Rhycolopus*. These birds skim over the sea with the lower mandible.

ble, which is much longer than the upper and compressed like a knife-blade, cutting through the water. They are related to the terns, but belong to a distinct family. The black skimmer (*R. nigra*) is black above, white below. The spread of wing is 3½ to 4 feet; length, 16 to 20 inches. It ranges northward to New Jersey, but *R. albicollis* is Indian and *R. flavirostris* African.

F. A. L.

Skin: See HISTOLOGY.

Skin Diseases: diseases affecting the skin. These diseases appear as primary or secondary eruptions. The following are the primary forms: (1) The *macule* or *spot*, a change of the normal color of the skin without elevation, arises from hyperæmia, hæmorrhage, or inflammation, sometimes from anomalies of the distribution of the coloring granules of the skin. (2) The *papule* or *pimple*, a projection above the surface, varying in size from that of a millet-seed to that of a lentil, is produced by diseases of the cutaneous glands, inflammation, and new growths of the papillary layer. (3) The *tubercle* is a solid projection of the size of a lentil up to that of a hazel-nut. (4) The *wheel* is slightly raised above the surface, and greatly exceeds the thickness in horizontal extension, varying in size from that of a finger-nail to that of the palm of the hand. (5) The *tumor* forms a solid projection of the size of a walnut to that of a man's fist. (6) *Vesicles* are elevations of the epithelial layer of the skin produced by a transparent or milky fluid, corresponding in size to that of papules, and as such never being of a long duration; while (7) *blebs* surpass the size of vesicles up to that of a goose's egg, and (8) *pustules* always contain pus, and therefore form superficial abscesses of the skin. Vesicles, blebs, and pustules almost always are surrounded by inflammatory areas.

Secondary forms of eruptions are (1) the *excoriation*, a flat abrasion of the epithelial layer of the skin, arising from destruction and rupture of primary eruptions, very often through scratching with the finger-nails. They always heal without the formation of a scar. (2) The *ulcer* presents a loss of substance penetrating into the derma, which heals slowly and with formation of a cicatrix. (3) *Fissures* are elongated cracks in the skin on parts liable to much stretching. (4) *Scales* are produced by detached epidermis. (5) *Crusts* result from drying of an exuded fluid or of extravasated blood. (6) *Scars* or *cicatrices* are connective-tissue formations which replace deeper losses of substance of the derma.

The causes of diseases of the skin are either rooted in the whole organism, or they are local ones, by which the skin is primarily or chiefly attacked; hence the division into symptomatic and idiopathic affections of the skin. Certain rashes occur in variola, scarlet fever, measles, syphilis, in typhoid fever, in purulent infection of the blood, so-called pyæmia, in scrofulosis, scorbutus, etc. Moreover, diseases of internal organs may involve the skin, especially affections of the intestinal tract, of the liver and spleen, of the internal genital organs, of the urinary apparatus, of the nerve-centers. There are, lastly, normal processes—dentition, menstruation, pregnancy—which lead to various kinds of cutaneous affections. Besides general injurious influences—heat and cold, dryness and moisture, different arts and trades—merely local diseases are caused by the operation of caustic substances, neglect of cleanliness or exaggerated washing and rubbing with strong kinds of soap, long-continued pressure upon certain parts, and parasitic organisms which penetrate the skin. The scratching of the patient himself who suffers from itching is an important cause for producing mechanically lesions of the skin. Thus parasites give rise to such affections by irritating the skin directly or by exciting the sensibility of the cutaneous nerves by producing the sensation of itching.

The changes of the skin, by too great an afflux of blood (hyperæmia) or lack of blood (anæmia), as such do not produce diseases of their own, being always of a transient character or rooted in diseases of the whole organism, and are therefore omitted in the following enumeration.

1. *Diseases due to Perverted States of the Secretions of the Cutaneous Glands.*—The sweat-glands of the skin (see HISTOLOGY) produce a fluid, the perspiration, which contains 99.3–99.5 per cent. of water, the residue consisting of solid matters, among which are chloride of sodium, phosphate of lime, hydrochlorate of ammonia, and traces of iron and of fatty matters. Even in the normal state each individual diffuses a special odor. There are persons with a peculiar rancid odor of their perspiration, a disease called *bromidrosis*, either universal or local—for instance, lasting in the

armpits, on the feet—in spite of the most scrupulous cleanliness. This disease is always dependent on too copious perspiration (*hyperidrosis*), and curable by repeated treatment with diachylon ointment. The secretion of a colored perspiration is termed *chromidrosis*. The sebaceous glands, which secrete a fatty mass, may produce the sebum in excessive quantity, there being no impediment to its secretion—the so-called *seborrhœa*. The disease is very common on the scalp (dandruff), and always leads to loss of the hair. It yields readily to certain preparations of tar, and a new growth of hair can very often be obtained. If, on the contrary, the excretion of the sebaceous mass be interfered with, the result is its accumulation within the glands or their ducts, the so-called flesh-worm—*comedones*. In the mass of a flesh-worm there is often found a mite, the *Acarus folliculorum*. The flesh-worms, again, are the most common causes of pimples, as they act upon their neighborhood like foreign bodies.

2. *Diseases due to Inflammation.*—Inflammatory affections of the skin may be acute or chronic. The acute contagious inflammations, so-called *exanthemata*, are due to diseases which attack the whole organism, are attended with febrile symptoms, present certain definite appearances on the surface of the body, and run a course the duration of which can be computed beforehand. In these diseases—*measles*, *scarlet fever*, and *smallpox*—the sympathy of the entire organism is manifested by symptoms of various kinds, both while the rash is present and also after its disappearance. The acute, non-contagious inflammations have a definite typical course, as their symptoms succeed one another in regular order. If the inflammation be manifested mainly by redness, with a slight exudation of the fluid part of the blood, fugitive rashes are produced, which, when spread over large parts of the surface are termed *erythema*, but when presenting isolated red spots are termed *roseola*. Extended and isolated superficial inflammations, accompanied with stinging or itching sensation, receive the name of *urticaria*, the latter being always characterized by the development of wheals. Diseases of this kind often are produced by disturbances of the stomach or by local irritations of the skin. They usually disappear after a short time without special treatment, but are very liable to recurrences. Lastly, there exist acute inflammations with accumulation of fluid beneath the epidermis, leading to the formation of vesicles and blebs, with short duration and no liability to return. The *herpes zoster* (shingles) is the most important of the forms of HERPES (*q. v.*). Shingles attack the individual, in most instances, only once during life. The chronic inflammations, such as PSORIASIS, LICHEN (*qq. v.*), and *pityriasis rubra*, are characterized by a tendency to repeated relapses and the protracted course which they run. Psoriasis is a very common disease, characterized by white, rough patches on a dark-red ground, dispersed all over the body, mainly on the elbow and knee. The patches are not liable to any further change, such as supuration and ulceration; they leave no scars, though they are sometimes followed by persistent pigmentation. Sensations of pricking or itching are complained of only when the patches first come out; afterward there are no subjective symptoms. The disease occurs often on otherwise healthy and strong individuals.

A second group of inflammatory affections is characterized by intense itching, and besides the primary form of eruption they irresistibly provoke scratching in consequence of the itching; this, again, gives rise to further changes in the skin known as excoriations. To this group belong ECZEMA (*q. v.*) and *prurigo*.

A third group of chronic inflammatory diseases embraces those pimply and pustular affections which arise from inflammation of the hair-sacs and sebaceous glands. They include *acne*, *sycosis*, and *rosacea*. Acne on the face, the chest, and the back—one of the most disfiguring diseases—is always produced by accumulation of sebaceous masses in the glands (flesh-worms), and is entirely curable by repeated emptying of the glands.

To the fourth group of chronic inflammations belong the eruptions in shape of blebs, termed PEMPHIGUS (*q. v.*). Chronic inflammations of the skin of very variable but characteristic forms are produced by a general disease, *syphilis*; here the skin is merely symptomatically attacked, besides different other organs. With traumatic lesions of the skin, as well as with its inflammatory diseases, hæmorrhage is very often combined. Hæmorrhage is furthermore a symptom of universal disease in *scorbutus* and in *purpura rheumatica*. See PURPURA.

4. Diseases due to Hypertrophy.—Two explain production of any disease of the skin may be a consequence of a chronic inflammatory process, or it may occur without the symptoms of irritation as a consequence of anomalous congenital productivity. The *corns* and the *tyloma*, for instance, are products of a long-continued local irritation of the skin, but instances are known in which tyloma, the hardening and hypertrophy of the skin of the palms and the soles, must be considered as a congenital disease. The *Exanthematous* (q. v.), an immense hypertrophy of all constituting tissues of the skin, is doubtless due to chronic inflammation of the lymphatics; while *Ichthyosis* (q. v.), the exuberant growth of epidermis, is due to the congenital hypertrophy of the papillae. *Warts* and *papillary growths* of the skin may be produced by either kind—local irritation as well as anomalous function of papillae. *Horns* of the skin, hypertrophy of the nails and the hairs—*polytrichosis*—always are dependent on congenital anomalies in the formation of the tissues of the skin. The pigment-granules of the rete mucosum are very often hypertrophied, leading to formation of brown spots, *ephelides* (freckles), *adrenas* (liver-spots), while long-continued irritation of the skin leads to universal dark discoloration—*melasma*.

5. Diseases due to atrophy are based on the same principles as hypertrophy. Inflammation often produces first hypertrophy, afterward ulceration, loss of substance, and atrophy. Hypertrophy of the pigmentation is not rarely combined with its partial atrophy in *vitiligo*, *leukopilia*, etc. Mostly to atrophy are due the senile changes of the skin, the white color of the hairs, the early falling out of the hairs without visible cause, the localized atrophy of hairs in *alopecia areata*. (See BALDNESS.) A plain atrophy is also the *anorexia*. Very little can be done with regard to the cure of these diseases.

6. Diseases due to New Growths.—New growths or tumors either belong to the connective-tissue formations of the skin, the *derma*, or are products of an anomalous epithelial growth. Tumors of the former kind may be benign or innocent, viz., painless, not ulcerating, not recurring after excision, and not infecting the organism, such as *fibroma*, a variety of which is the formation of scars without preceding lesion, the so-called *chloïd*; furthermore, *papilloma*, growth of the papillary layer, embracing most of the *warts* and *naevi*; lastly, *myxoma*, erectile tumors produced by enormous new formation of blood-vessels. Or the connective-tissue tumors are malignant, viz., painful, ulcerating, producing new growths around the first-formed tumor, and easily recurring after excision, even leading to secondary formations of identical tumors in the lungs, the liver, etc., such as *scirrhus*, one variety of which, the *pigmented* or *melanotic scirrhus*, forms the most malignant kind of tumors of the organism. Cancer is considered to be essentially an epithelial formation, which always is malignant. In all tumors the radical extirpation is the only reliable means of curing the disease, very often of saving the life of the patient.

7. Diseases due to Anomalous Innervation.—*Neuroses*.—Many of the already named diseases of the skin can be looked upon as being disturbances of the nerves in the first instance *urticaria*, *herpes zoster*, *leprosy*, *atrophy of pigment*. Disturbances in the property of sensation of the skin are lowered sensibility—*anesthesia*—and excited sensibility—*hyperesthesia*. To the latter kind belongs the itching of old persons, *pruritus senilis*.

8. Diseases due to Parasites.—The *Scabies* (q. v.) is produced by the presence of the itch-insect within the epidermis. The disease is readily curable by local application of preparations of sulphur. Analogous is the action of the flea, the bedbug, and the louse. By vegetable parasites are produced slightly swelling and itching brown spots, *pityriasis versicolor*; furthermore, *herpes tonsurans* (ringworm), a very common disease, appearing first in the shape of small vesicles or ring-like red eruptions, which, when situated on the parts provided with hairs, lead to baldness; lastly, *Favus* (q. v.), a disease limited to ringworm. If the parasites are killed locally, a perfect cure can be obtained; but on the scalp and the beard, where the parasites advance deeply into the root-sheaths of the hairs, these diseases usually are very obstinate.

Revised by G. H. Fox.

Skink : any one of the lizards of the family *Scincidae* (q. v.).

Skin-moths : beetles of the family *Dermestidae*, which attack skins, etc., and are often very destructive in museums. The most notable species are (1) *Dermestes lardarius*, (2)

Dermestes vulpinus, and (3) *Anthrrenus venosus*. The first is for the most part blackish, with a broad brownish-gray band on the elytra, relieved by three black spots on each side. Both the larva and the larva are very destructive. The second is totally black above, but the sides of the thorax and the under part of the body are covered with white scales. It is less common and less generally distributed than the preceding, but almost equally to be dreaded. Both the preceding attain about a quarter of an inch in length. The third species has three transverse wavy lines on the elytra. It is often very destructive to museum specimens, and especially to collections of pinned insects. It has become a household pest, and is known as *buffalobug* or *carpet-beetle*. It is only about a tenth of an inch in length. All these species may be killed by applications of benzoin; and this remedy is perhaps the most efficacious, although camphor and turpentine are also used. Specimens for museums should be prepared for resistance to the attacks of these insects by applications of arsenic, carbolic acid, corrosive sublimate, and boracic.

H. S. Huxar.

Skinner, JOHN SEYMOUR; editor: b. in Maryland, Feb. 12, 1758; was admitted to the bar 1809; settled at Baltimore 1813; was postmaster of that city 1808-17; began in 1819 the publication of *The American Farmer*, the first periodical exclusively devoted to agriculture in the U. S.; afterward edited several other periodicals of similar character, including *The Turf Register* and *The Plough, Loom, and Anvil*; was the first organizer of agricultural shows and fairs in the Middle and Southern States; wrote several works on farming and sporting topics, and was third assistant postmaster-general 1841-45. D. in Baltimore, Mar. 21, 1851.

Skinner, STEPHEN, M. D.; etymologist; b. in London, England, in 1623; graduated at Christ Church, Oxford, 1646; studied philology and medicine on the Continent, especially at Heidelberg; became a physician at Lincoln; was an earnest student of many languages, and devoted his life to the preparation of a vast work on English etymology, which he left incomplete at his death, which occurred at Lincoln, Sept. 5, 1667. Fortunately his MSS. fell into the hands of Thomas Henshaw, who edited them under the title *Etymologicon Linguae Anglicanae* (London, folio, 1671), a work of great value to the critical student of English.

Skipjack : any one of several fishes having a tendency to leap from the water, as the *Bostry* (q. v.), the *Bufo* (q. v.), the *Saur* (q. v.), and a fresh-water herring, *Clupea chrysocloria*.

Skipper : (1) the *Saur* (q. v.); (2) any one of several small dark-colored butterflies of the family *Hesperidae*.

Skirret : the *Sium sisum*, an umbelliferous parsley-like plant, a native of Asia, long cultivated in Europe, and rarely in the U. S., for its root, which is very nutritious and palatable. Skirret affords a good percentage of alcohol when distilled, owing to the large amount of sugar present.

Skittagetan Indians [*Skittagetan* is derived from Skitket, the name of a chief, and was first employed by Gallatin in 1848] : a linguistic family, also well known as the *Haida*. They are in two divisions, the *Haida* proper and the *Kaigani*. The former are confined to the Queen Charlotte Islands, Northwestern America; the *Kaigani*, who form an offshoot of the *Haida* proper, emigrated to Forrester and Prince of Wales islands, probably since 1750. In the *Haida* division there are thirteen villages, besides eleven that have been abandoned, and in the *Kaigani* division there are seven occupied villages and three abandoned ones. Five other villages, which can not be identified with any of the preceding ones, were named by Krause in 1855.

General Characteristics.—Investigations into the native languages by Dr. Franz Boas render it quite probable that the family should be merged into the neighboring *Koluschan* family. (See *KOLUSCHAN INDIANS*.) They are larger, better proportioned, and of lighter complexion than the *Salish* and other southern coast-tribes. The *Haida* are essentially maritime Indians, and derive their subsistence from the rivers and sea. Shellfish are much used, as are all edible roots and berries. The first rude beginnings of agriculture are discernible among them in the cultivation, from a remote period, of tobacco, either the true plant or one of the several substitutes employed. The dog was their only domesticated animal. The *Haida* live in permanent villages, but they scatter more or less at different seasons in pursuit of food. The houses, which are the large structures common to the northwest coast, are occupied continually, several

related families dwelling under one roof, the household being governed by an elder or sub-chief. There is nothing in the nature of a confederacy of the several villages. The chieftaincy was hereditary, and, as descent was through the female line, it passed, on the death of a chief, to his eldest brother, or, there being no brother, to his sister's son. Customs came to have the force of laws, and persons were restrained from injury to the person or property of a fellow tribesman by the custom of reprisals. In some respects, apparently, the tribes of the northwest coast, especially the Haida, had advanced beyond the condition of the eastern Indians, as partially shown by the extent to which they possessed personal property, and by the establishment of personal ownership in land. The Haida appear to have been of martial character, internal warfare having been common, as also forays upon distant tribes for the purpose of procuring slaves. The institution of hereditary slavery seems to have been intimately woven into the social system of the Haida, and slaves were regular objects of barter. The Haida are skillful workers in wood, and to some extent in metal, particularly copper. Their great skill at carving is seen, perhaps at its best, in the well-known carved totem-posts which adorn each village. Tattooing was formerly universal; labrets were worn by the females. The institution of the potlatch—the free distribution of property on certain ceremonial occasions—exists among the Haida, as among all the tribes of the northwest.

Population.—Dawson estimates the present number of the Haida to be from 1,700 to 2,000; Petroff gives the number of the Kaigani as 788. These figures indicate a marked decrease of population since 1850.

Authorities.—H. H. Bancroft, *Native Races* (1882), iii., 564, 604; J. C. E. Buschmann, *Spuren der aztek. Sprache* (1859), 673; Dawson, *Queen Charlotte Islands* (1880); A. Gallatin, in Schoolcraft's *Indian Tribes* (1853), iii., 402; Krause, *Thinkit Indianer* (1885), 304; L. H. Morgan, *Ancient Society* (1878), 176; I. Petroff, Tenth Census, Alaska (1884), 32; Poole, *Queen Charlotte Islands* (1872), 195, 309; H. R. Schoolcraft, *Indian Tribes* (1855), v., 489; Tolmie and Dawson, *Comparative Vocabularies* (1884), 15, 26. See **INDIANS OF NORTH AMERICA**.

JAMES OWEN DORSEY.

Skittles: See **BOWLS AND BOWLING**.

Sko'beleff, MICHAEL DMITRIEVITCH: Russian general; b. in 1841; served in the army against the Polish insurrection in 1863; was called to join the general staff in 1866; and in 1869 was sent to Turkestan, where he secured much valuable geographical information, which he afterward employed to great advantage in the expedition against Khiva in 1873. In this expedition he won great distinction. He afterward crushed the rebellion in Khokand, and became governor of the territory he had subdued. In the Russo-Turkish war he showed a degree of valor and skill in marked contrast to the inefficiency at the Russian military headquarters. He commanded the left wing at Plevna, captured the so-called Shipka army, Jan. 9, 1878, and took Adrianople. D. suddenly in Moscow, July 7, 1882. See Ossipovitch, *Michael Dmitrievitch Skobelev* (Hanover, 1887).

Skoke: See **GARGET-ROOT**.

Skowhegan: town; capital of Somerset co., Me.; on the Kennebec river, and the Maine Central Railroad; 35 miles N. by E. of Augusta, and 50 miles W. of Bangor (for location, see map of Maine, ref. 6-C). It derives excellent water-power from the river, which has here a perpendicular fall of about 30 feet, and has manufactories of woolen goods, scythes and edged tools, shoes, oilcloth, pulp, lumber, and flour. There are electric-light and power plants, water-works, 7 churches, free public library (founded in 1867), 2 national banks with combined capital of \$275,000, a savings-bank, and 2 weekly newspapers. The town was originally known as Canaan; was incorporated under the name of Milburn in 1823; has been called Skowhegan since 1836. It was enlarged by the annexation of the town of Bloomfield in 1861. Pop. (1880) 3,869; (1890) 5,068.

J. O. SMITH, EDITOR OF "SOMERSET REPORTER."

Skua, or Skua-gull: See **JAEGER**.

Skull [M. Eng. *skulle*, loan-word from Scand.; cf. *icel. skál*, bowl; Germ. *schale*; cf. *hirsnschale*. Eng. *scale* (of balance) is a doublet, of native origin]: the hard framework of the head of vertebrates. It consists of two portions, the cranium which forms the protecting case for the brain, and the facial structures. These may all consist of cartilage throughout life, as in the sharks, or entirely of bone, as in

adult birds and mammals, or of both bone and cartilage, as in many fishes and amphibians. In the lower forms no separate cranial elements can be recognized, the brain-case forming a continuous structure, with openings here and there for the passage of nerves, blood-vessels, etc. In the higher vertebrates distinct elements or bones can be recognized in the cranium, and these arise either by ossification of the cranial cartilage or by the formation of bone in the membranes outside the cartilage cranium. A similar distinction can be drawn between the cartilage-bones and the membrane-bones of the face. For the details of the bones of the skull, reference should be made to works upon comparative anatomy. The following are the bones more frequently found in the skull, arranged according to their origin and position:

Cranium.

Cartilage-bones:

Floor. Basisphenoid, basisphenoid, presphenoid.

Sides. Exoccipital, bones of the ear-capsule (otic), orbitosphenoid, alisphenoid.

Roof. Supraoccipital (part).

Front. Mesethmoid, lamina cribrosa.

Membrane-bones:

Floor. Parasphenoid.

Sides. Temporal or squamosal, parietal, supra- and post-orbital.

Roof. Supraoccipital (part), frontal, pre- and post-frontal.

Face.

Cartilage-bones: Palatine, pterygoid, quadrate, and articular.

Membrane-bones: Premaxillar, maxillar, vomer, nasal, lachrymal, jugal, and quadratojugal, and in the lower jaw the dentary, splenial, and angular.

It is rarely that all these bones are present in one and the same form. Usually there is an over-development (hypertrophy) of one and an under-development (atrophy) of its neighbors, or a fusion of two or more may occur. Still other bones may exceptionally appear (e.g. in the suspensory apparatus of fishes), which are properly not to be regarded as belonging to the skull. Although the subject of an enormous amount of study, the skull is yet far from thoroughly known. The best general account will be found in Parker and Bettany's *Morphology of the Skull* (London, 1877).

In the human skull but twenty-two bones exist, eight in the cranium and fourteen in the face. This is largely due to the fusion of bones distinct in the embryo as well as in the adult of lower forms.

J. S. KINGSLEY.

Skull-cap [so called from the helmet-like appendage to the upper lip of the calyx]: any one of a genus (*Scutellaria*) of perennial herbs found over a wide range of climates in America, especially in Mexico and the sub-tropical regions, though several species grow in northern parts of the U. S. and in Europe. They derive their name from an envelope around the fruiting calyx, have little aroma, and—especially for the cure of hydrophobia—enjoy a popular reputation which is entirely undeserved.

Skunk [from Abenaki (Amer.-Ind.) *sekan'ku*, skunk]: a musteloid carnivorous mammal of the sub-family *Mephitinae*. The body is moderately elongated and arched backward; the legs comparatively short; the feet sub-plantigrade; the tail rather long and very bushy; the color is particolored, black and white being contrasted. Their anal glands, according to Chatin, are essentially like those of the badgers and rats, and are in a single pair and of large dimensions; their outer walls are formed by a thick fleshy tunic formed of two layers of interlaced fibers, capable of sudden strong compression of the receptacles; these are enormous reservoirs, with a dense resisting fibrous coat, always containing a considerable quantity of the follicular product. The glandular substance is not spread all over the central pouch, but is restricted to a particular portion, and contrasts by its dark color with the white ground of the envelope of the pouch. The receptacles contain a nauseous liquid, which the animal, on being alarmed, discharges with such force that the jet is carried to a distance of from 8 to 12 feet. The voiding of the liquid must be sudden; and it does not suffice that the receptacle is large and powerfully muscular; the offensive liquid must be directed far backward, so as to flow as little as possible upon the rectal muscular membrane; so the opening is large and upon the summit of an umbilicated papilla, around

which vents a cutaneous fold which in a measure directs the discharge. The skunks are distributed throughout America, North as well as South, except the colder parts, and are found in no other portion of the world. The species are all active, carnivorous animals, feeding on small quadrupeds and birds as well as reptiles. They burrow in the ground, and in the northern parts of North America remain torpid during the winter. They bring forth from six to nine young at a birth. The mephitic fluid has been employed medicinally to some extent as an antispasmodic in hysteria, asthma, etc. The bite of the animal is in some quarters much dreaded, and is said to induce hydrophobia. *Mephitis mephitis* is the common large skunk; *Mephitis putorius* is the little striped skunk; *Conopatus macrurus* is about the size of *Mephitis mephitis*, and extends into the southwestern parts of the U. S. (Texas, etc.), from Mexico. Although they vary much in color, they can generally be distinguished as follows: The common species is black, with the crown white and with two white streaks diverging thence; the little striped skunk is black, with a spot on the forehead and one on each temple, and a number of white but interrupted longitudinal streaks on the back; *Conopatus macrurus* is black, but with a broad white dorsal median band.

Revised by F. A. Lucas.

Skunk-cabbage: the *Symplocarpus foetidus*, a large marsh-plant of the arum family, common in the U. S. from Maine to South Carolina, distinguished by the unpleasant smell of its large, broad, and veiny leaves. It is a monocotyledon, producing early in the spring its four-petaled flowers in a globose cluster upon a short stem within a shell-shaped spathe or hood, of a dark purplish, or with yellow and purple stripes and spots, variegated with patches of red or green. The fruit is oval and fleshy, inclosing large purple seeds. The roots and leaves have been used as stimulants.

Revised by CHARLES E. HENRY.

Skye: an island of Scotland, the largest of the Inner Hebrides, belonging to the county of Inverness, from the mainland of which it is separated by the channel of Kyle Rhea, half a mile broad. Area, 365 sq. miles. The surface is mountainous and rugged; the coast-line is steep, abrupt, and wild, but often strikingly picturesque on account of its smaller basaltic formations, its caves, and waterfalls. The soil is not unproductive, but, on account of the extreme dampness of the climate, it is unfit for agriculture. The name of the island, *Skye*, means cloud in the old Scandinavian tongue, and is very appropriate, as the days during the year on which no rain falls are very few. Turnips and potatoes grow well, however, and sheep-breeding is carried on with some success. Fishing is the principal occupation, and large quantities of salt and dried cod, herring, ling, and salmon are exported. The inhabitants, who are of Gaelic descent, interspersed with Norse settlers, and who still use the Gaelic language, are poor, and their number decreases, as many emigrate. Pop. (1851) 21,521; (1891) 15,795.

Sky-lark: the *Alauda arvensis*, an Old World bird, noted for its song. It has the feathers of the occiput slightly prolonged, the first primary very small, the second and third (which exceed the fourth) equal, and the external tail-feathers margined with white; the upper parts are variegated with blackish and reddish gray; the lower parts white on the abdomen, but with the neck, breast, and sides tinged with reddish and spotted with brown. The length is about 7 inches, the tail being 3. The skylark is found all over Europe, as well as in Northern Africa and the corresponding parts of Asia. It frequents meadows, and does not perch. It feeds chiefly on the seeds of various plants and herbs. Its nest is formed on the ground. It lays four or five eggs of a whitish gray. It is almost equally esteemed for the delicacy of its flesh and the melody of its song.

Skyros, or **Neyros**: Greek island; in the Egean Sea; N. E. of Kuba. It consists of two mountains, the valley between forming a narrow isthmus. It has two good harbors, is well watered, and has fine forests of oak and pine. Its once lucrative silver mines and quarries of various-colored marbles are no longer worked. The inhabitants are supported by their vineyards and flocks of sheep and goats. Hence, according to mythology, Theseus was treacherously killed, and here Achilles concealed himself before the Trojan war. Pop. 2,198. See STRABO.

E. A. G.

Slag: from Swed. *slagg*, from, slag, or Dutch *slagge*; cf. Germ. *schlacke*, from, slack, borrowed from like source; also to *schlagen*, strike—i. e. the splinters struck off in forg-

ing; the imperfect glassy or vitrifiable compounds which are produced during the collection of metallic ores by various fluxes. The slags produced in metallurgical operations should have the following properties: They should fuse at the right temperature; be of such fluidity and specific gravity as to allow the metal or scale (*regulus*) produced to sink easily through them; have such a composition that they will not attack the desired product or the furnace-walls, and will not allow undesirable bodies to separate from themselves; must be able to take up foreign substances, and must be in sufficient quantity to protect the desirable products from the hurtful influence of the blast or other agencies. It is seldom the case that all of these conditions can be fulfilled, and therefore the efforts of the smelter must be directed to securing as advantageous a combination as possible. The slags of ordinary occurrence are siliceous, combinations of silicic acid with bases already present in the charges or formed during the operation; but they frequently contain partly sulphides and fluorides, as well as particles of metal and matte. Sometimes they may be looked upon as single chemical compounds, at other times they appear to consist of mixtures, but in normal slags the amount of silicic acid is always within certain limits.

Frequently, by judicious mixtures of ores, the proper slag can be obtained without adding any flux; at other times a basic flux, like limestone, will be absolutely necessary. Occasionally there will be an excess of alumina, and it is then to be regarded as playing the part of an acid, but aluminas without silicates do not serve as slags. The most infusible silicates, like silicate of zinc or tin, can be made to fuse when combined with other silicates. A slag should not fuse before the desired effect has been produced in the furnace, such as the reduction of an oxide, absorption of carbon by iron, sulphurization of roasts, etc. Slags are often affected by the manner in which they solidify; rapid cooling producing a glassy, brittle slag, while slow cooling tends to produce a stony, tough slag, provided the chemical constitution is right. For this reason the slags when used for paving or building are slowly cooled. Slags have also been used to manufacture cement and alum, for fertilizers, and for ornament. The slag from the basic Bessemer-steel process is used as a substitute for phosphates.

The color of slags is very various. Generally a dark slag will owe its color to metallic oxides, dark green or black indicating iron oxides, and dark brown manganese; light green indicates protoxide of iron; red or reddish brown, sesquioxide of copper. Some very dark slags from iron furnaces, however, owe their color probably to sulphur, and contain little iron oxide. The peculiar blue of some blast-furnace slags has been referred to the presence of vanadium, molybdenum, cobalt, and titanium. While each or all of these may be present in blue slags, and may possibly cause their color, especially the cobalt oxide, Bontemps has shown that oxide of iron alone can impart all colors to glass; while Fourcet refers the blue shades of most of these slags to their physical constitution. The blue color of old zinc retorts has been also referred to the presence of titanium; and Wöhler considered that certain blue slags from blast-furnaces owed their color to a compound like ultramarine, but containing sulphide of calcium in place of sulphide of sodium. Among the minerals closely imitated by certain slags in composition and crystalline form may be mentioned amphibole, pyroxene, wollastonite, diopside, gabbroite, and labradorite.

Revised by C. KIRCHHOFF.

Slander: See LIBEL AND SLANDER.

Slate [M. Eng. *slat*, *selat*, from O. Fr. *selat*, a shiver, splinter, deriv. of *scaler*, shiver, chip (> Fr. *schaler*, burst, break forth)]; a rock, consisting largely of silicate of aluminum, which is easily split into slabs or plates. It is supposed to have been formed by the consolidation, under heat and pressure, of clay deposited in still water. It is known also as clay-slate and argillite. It weighs from 170 to 180 lb. per cubic foot, and its most extensive use is for roofs. The output of slate in the U. S. in 1892 was valued at \$4,117,125, of which \$2,529,000 worth was quarried in Pennsylvania and \$1,914,000 worth in Vermont. In 1894, owing to business depression, the output was much less. See Merrill's *Slates for Building and Decoration*, and articles on *The Strength and Weathering Qualities of Roofing Slates*, in *Transactions of the American Society of Civil Engineers* for Sept., 1892, and Dec., 1894.

M. M.

Slaters: town; Saline co., Mo.; on the Chi. and Alton Railroad; 12 miles W. of Glasgow, 96 miles E. of Kansas

City (for location, see map of Missouri, ref. 3-F). It is in an agricultural region, and contains 2 State banks with combined capital of \$150,000, a public high school, and a daily and 3 weekly newspapers. Pop. (1880) 771; (1890) 2,770.

Slater, SAMUEL: manufacturer; b. at Belper, Derbyshire, England, June 9, 1768; was apprenticed at the age of fourteen to Jedidiah Strutt, partner of Arkwright in the business of cotton-spinning; saw in a newspaper in 1789 the law passed by the U. S. Congress in that year for the encouragement of manufactures, and a notice of the bounty offered by the Pennsylvania Legislature for the introduction of the Arkwright patents into the U. S., the communication of the models of the new machinery to foreign countries being then forbidden by English law under severe penalties. Believing himself able to construct new machinery from memory, he sailed for New York. He entered into a contract with William Almy and Smith Brown, of Pawtucket, R. I., to construct and work the new cotton-spinning machinery, and started at Pawtucket, Dec. 21, 1790, a mill with three carding-machines and seventy-two spindles, which was the virtual beginning of the manufacture of cotton in the U. S. He erected cotton-mills at Oxford (now Webster), Mass., in 1812, to which he added woolen-mills 1815-16, the nucleus of the village of Slatersville. D. at Webster, Mass., Apr. 21, 1835. See Rev. George S. White's *Memoir of Samuel Slater* (Philadelphia, 1836; 2d ed. 1846).—His nephew, JOHN FOX SLATER (1815-84), became a manufacturer, and in 1882 gave \$1,000,000 for the education of freedmen in the South.

Slatington: borough (incorporated in 1864); Lehigh co., Pa.; on the Lehigh river, and the Lehigh Val. and the Phila. and Reading railways; 16 miles N. W. of Allentown, the county-seat (for location, see map of Pennsylvania, ref. 5-1). It has 9 churches, 14 public schools, including a high school with college preparatory department, extensive slate-quarries, rolling-mills, steam-boiler works, large school-furniture factory, a national bank with capital of \$100,000, and a weekly newspaper. Pop. (1880) 1,634; (1890) 2,716; (1895) estimated, 3,500. EDITOR OF "NEWS."

Slave Coast: old geographical name for that part of the coast of Upper Guinea which is about the Bight of Benin, so named because formerly a favorable place for obtaining slaves. It is now in part Dahomey, under French protection, and in part (to the E.) the territory of the Royal Niger Company. See DAHOMEY and NIGER TERRITORIES.

Slave Lake and River: See GREAT SLAVE LAKE.

Slavery (deriv. of *slave*, of like source with Germ. *sklave* < M. H. Germ. *sklave*, *slave*, Dutch *slaaf*, Fr. *esclave*, originally a Slave, a Slavonian. The word acquired its meaning in Italy in the eighth or ninth century): a state of bondage in which one human being is in complete subjection to the will of another. In its usual sense it is restricted to chattel slavery, in which the slave may be bought and sold like ordinary property, and it thus excludes the milder forms of bondage, such as serfdom or villanage. In its origin it was the sign of advancing civilization, in that it arose from the practice of sparing the lives of captives, who in the period of primitive savagery were generally slain by their captors. The arts of production must have reached the point at which a man's labor produced a surplus over what was necessary for his own support, for among barbarians clemency toward captives sprang from the perception that an economic benefit might be gained by their enslavement. The slavery of the industrial classes has characterized the early history of all civilized races, and as forcing men to labor, despite the natural reluctance inherent in barbarous tribes, seems to have been a necessary element of progress. It existed among all the races of antiquity of whom there is historic record, but in some its rigors were mitigated by peculiar laws and customs, as among the Hebrews, whose slaves became free after seven years had elapsed from the beginning of their servitude, while every fiftieth year, on the occasion of the jubilee, all slaves were emancipated.

Greek Slavery.—The Homeric poems bear witness to the antiquity of the practice of holding slaves among the Greeks. In the historic period the supply seems to have been kept up by capture in war, and by purchase from the slave-owners of Asia Minor and Thrace. Kidnapping, the sale of children by their parents, and enslavement for debt were also sources of supply. The rearing of slaves was never an abundant source in Greece, as it was cheaper to purchase those who had already reached the age of labor. They were employed in domestic service, in agriculture, and even in

commerce, manufactures, and occupations in which the risk and responsibility were great. As to the relative numbers of the slaves in Greece reliable statistics are lacking, but it is probable that in the cities they were greatly in excess of the free population. It is estimated that in Attica the slaves bore to the free native population the ratio of three to one, and in Sparta the Helots are said to have numbered 220,000, while the Spartans numbered only 32,000. Their treatment differed greatly in the different cities. In Sparta the Helots suffered cruel treatment at the hands of their masters, despite their kinship of race, while the Athenian masters were noted for their mildness. By the Athenian law a slave who had just grounds for complaint against his master could demand to be sold; he had a right to asylum in the temples and sacred places, and his death could be avenged like that of a free citizen. He could purchase his freedom with the money that he had saved during servitude, and could be liberated by the act of his master. As a reward for fidelity or honorable services emancipation was frequent. No consciousness of the injurious moral effects of slavery seems to have been felt by the greatest thinkers of classic Greece. Aristotle and Plato both regarded the institution as necessary, the former holding it to be beneficial to both parties if practiced with justice.

Roman Slavery.—In Rome slavery became more highly developed, and formed a more essential part of the social and political system than in any other ancient state. As in Greece, the sources of supply were wars and commerce with the slave-producing countries of the East, the latter being by far the more important source in the latter years of the republic and under the empire. The proportion of slave to free population is estimated by Blair at three to one in the period from the middle of the second century B. C. to the reign of Alexander Severus (222-285 A. D.), and the number of slaves owned by a single master was often very large. A freedman in the reign of Augustus is said to have left by his will over 4,000, and families of 200 or 300 slaves were not uncommon. As to the legal status of the slave, he was under the complete dominion of his master, against whom he had no legal redress. The marriage of slaves had no legal recognition, and their union (*contubernium*) was terminable at the will of the master; nor could a slave legally acquire property, though it became customary to permit him to enjoy a share of his earnings, known as his *peculium*. In general, punishments for crime were more severe against slaves than against free men. Their harsh treatment is attested by several servile insurrections, of which the most formidable were that of Eunus in Sicily in 133 B. C. and that of Spartacus in 73 B. C. By the second century, however, when the period of conquest had closed and the policy of the state aimed at peaceful development within existing limits, a greater humanity began to display itself in dealing with the slaves. This was furthered by the spread of Christianity, which, though it did not expressly forbid slavery or brand it as a crime, rested upon premises which must lead inevitably to its destruction. Accordingly, when the Teuton invaders settled within the Roman empire, they found the condition of slavery greatly modified. A system of caste or heredity in occupation had developed in both private and public business. The *coloni* on the landed estates were personally free, but could not leave the lands of the proprietors, and the prædial slaves in the course of time approached the condition of the *coloni*. Upon contact with the Roman civilization the Germanic tribes were naturally affected by the system of agricultural labor which they found in operation. Almost the only form of slavery known among them had been the slavery of the cultivator of the soil, and this gradually conformed to the condition of the Roman agricultural laborer. The resulting system was serfdom (see SERF), the effect of which was to lower somewhat the position of the old *colonus* while it raised that of the class of agricultural laborers as a whole.

Mohammedan Slavery.—During the Middle Ages slavery was still practiced, but among Christian races the enslavement of Christians was opposed by the Church. No such scruple applied to the enslavement of Mohammedan captives, many of whom were held as slaves throughout Europe, while numerous Christian slaves were left in the hands of the Turks and Saracens in the course of the many conflicts between Christianity and Mohammedanism. Many Moslem slaves were introduced into Europe by the great commercial cities of Italy, which carried on an extensive slave-trade with the East. On the other hand, the corsairs of Barbary carried off thousands of Christians into slavery, even pene-

leading into the interior of Spain and Southern France, and selling the peasants in their homes. Charles V. is said to have set free 20,000 Christian slaves after his expedition against Tunis in 1535, and 10,000 Christian galley-slaves were liberated after the battle of Lepanto in 1571. White slavery still exists among the Mohammedans, but the slaves are on the whole humanely treated. The traffic in black slaves, however, is marked by every form of atrocity, and has continued despite the prohibition of the Pope.

Yugoslav Slavery.—Though black slaves were to be found in Europe in the time of the Roman empire, African slavery on an extensive scale was not practiced by Europeans till after the discovery of America, when a great demand arose for Negro labor in the West Indian colonies of Spain. The Portuguese, who had introduced slaves into Europe some fifty years before, had at first a virtual monopoly of the slave-trade, but the English subsequently took part in supplying the Spanish demand. The rise of the North American colonies opened up another source of profit to the slave-traders. The first slaves sold to the English colonists were brought by a Dutch vessel to Jamestown in 1619, but the English afterwards supplied the greater number, and continued the trade throughout the eighteenth century, despite the increasing opposition to it on both sides of the Atlantic. The Quakers had from the first opposed it, but they lacked numbers and influence. Kinned, however, by Lord Mansfield's decision in the Somerset case in 1772, the enemies of slavery at last succeeded, through the labors of Clarkson, Sharp, Witherforce, and others, in bringing the matter before Parliament. After repeated failures to secure legislation against the slave-trade, they triumphed at last under the auspices of Fox and others, and an act abolishing the slave-trade was passed in 1807. They then turned their attention to the suppression of slavery itself. On Aug. 28, 1833, a law was enacted fixing Aug. 1, 1834, as the date for the emancipation of all slaves within the British empire, and providing for the payment of £20,000,000 to the masters, who, however, were to retain their slaves as apprentices till Aug. 1, 1840. The apprenticeship system was found to work badly, and was discontinued in 1848.

In the U. S. the slave-trade was forbidden by law in 1808. For many years before that time the abolition of slavery had been favored, not only by the Quakers, but by some of the leading statesmen. Franklin, Jefferson, Madison, and Jay were among the advocates of emancipation, and in the North this policy was so far carried out that by 1831 slavery had ceased to be a power in that region. The ordinance of 1787 prohibited slavery in the Northwest Territory. In the South, however, Eli Whitney's invention of the cotton-gin caused an ever-increasing demand for slave-labor, and the Southern States were growing more tenacious of slavery while the abolition sentiment was developing in the North. The more moderate opposition to slavery confined itself to attempts to restrict its sphere, and did not aim at unconditional abolition, but the latter policy was favored by radical reformers like Benjamin Lundy and William Lloyd Garrison, who represented a small and discredited but aggressive party. The story of the contest on the slavery question belongs to the history of the U. S., and is discussed under that title. In the Missouri Compromise (q. v.), in the struggle over the Wilmot Proviso, resulting in the formation of the Free-soil Party (q. v.), in the Kansas-Nebraska difficulty (see KANSAS), and finally in the formation of the REPUBLICAN PARTY (q. v.), the question of the extension of slavery became the leading issue in national politics. When civil war followed the secession of the Southern States from the Union, the expediency of the emancipation of the slaves as a war measure began to be seriously considered, and on Jan. 1, 1863, President Lincoln issued a proclamation granting immediate and unconditional emancipation. F. M. COLAR.

Slave-trade: dealing in slaves; in particular, the business of capturing or purchasing human beings, transporting them to another country, and selling them as slaves.

Slavery as a status is repugnant to the principles of the modern international law. In the Congresses of Vienna, 1815, Aix-la-Chapelle, 1818, and Verona, 1822, the contracting parties agreed to unite in suppressing the slave-trade. Several states forbade their subjects to engage in it; such were Denmark, Great Britain, and the U. S. Nevertheless it may exist, if recognized by the laws of individual states, within their jurisdiction only. The traffic in slaves carried on in the ships of such states could not be restrained without their consent, expressed by treaty. Accordingly, under the

influence of the agitation carried on by Zachary Macaulay, Sir Thomas Fowell Buxton, Witherforce, and others, the British Government, in the early part of the nineteenth century, began to make treaties with a number of states for the suppression of the slave-trade. To be effective, these treaties required one of two provisions: either (1) a reciprocal right to search the merchant ships of the contracting parties, or (2) cooperation by their naval forces. Such treaties were made by Great Britain with a great variety of powers, Spain and Portugal, the chief offenders, among them. As these treaties proved ineffective, they were amended or superseded by further negotiations. Most of these extended to British vessels the right to search ships flying the flag of the other nationality on suspicion of being engaged in the slave-trade, with provision for trial, either by mixed courts or by a court of the defendant. Two treaties with France and the U. S. bound the parties to maintain squadrons on the coast of Africa. The gradual success of these efforts has been in its field almost complete.

It was very natural that the efforts of Great Britain to draw the U. S. into an agreement to permit a mutual right of search should have been unsuccessful, for in the earlier half of the nineteenth century the memory of British pretensions in searching U. S. ships for British seamen and then impressing them was still fresh. The first treaty which concerned the slave-trade between the two countries is that of 1814. In it (Art. X.) both parties agreed to "use their best endeavors" to bring about its abolition, but no definite plan was arranged. By several acts during 1818, 1819, and 1820 the penalties for engaging in the slave-trade were increased; authority was given for the maintenance of ships on the African station; and for all persons under the jurisdiction of the U. S. the slave-traffic was declared to be piracy, that is, to be put into the same category with piracy by statute, and visited with the same penalty. Statutory piracy does not, however, warrant arrest and trial at the hands of any state, so that these statutes alone proved insufficient, and the British Government earnestly tried to persuade the U. S. to consent to a reciprocal right of search. This the latter steadily refused. The national sentiment against it was too strong; but the detestation of the slave-trade was strong also, and led to a resolution of the House, in 1820, in favor of an international agreement making it piracy. Nothing came of this, nor of negotiations in England the next year which provided a modified right of search, but the cases to be tried in the defendant's courts. In fact, it was not until 1842 that any joint arrangement was made, and this, avoiding the reciprocal right of search, provided that each country should maintain a squadron on the African coast, the two to act in concert. Finally, in 1862, the mutual right of search within certain limits, and under conditions, was conceded. Mixed courts were established at the Cape of Good Hope, Sierra Leone, and New York. The limits were extended a little by an additional article in 1863, and in 1870 the mixed courts were abolished, the ordinary prize-courts of the two countries taking cognizance of slave-trading cases.

It has been said that the slave-traffic off the African coast has been for the most part broken up, but the vast interior is given over to it, the hunting being carried on largely by Arab adventurers, and a market being found in the Mohammedan countries in the northeastern quarter of the continent. To check this traffic the civilized powers have addressed themselves, still under the lead of Great Britain. Thus in 1877 a convention was signed between Great Britain and Egypt, by which the slave-trade into or across the latter country was prohibited, with penalties for the parties implicated; the tribal wars having the making and selling of slaves as their object were to be discouraged; and a mutual right of search was granted on the Red Sea, the Gulf of Aden, the African and Arabian coasts, and in Egyptian waters. Another treaty with Portugal, in 1878, was aimed at the slave-trade within Portuguese jurisdiction in South Africa, and in 1884-85 the Berlin Congo conference decreed the abolition of the slave-trade within the Congo Free State. To make this abolition effectual, an important "General Act" was agreed upon in 1890, the parties to it including Turkey, Persia, the Congo Free State, Zanzibar, all the European maritime powers, and the U. S. This act begins by declaring the "most effective means of counteracting the slave-trade in the interior of Africa to be"—

(1) A civilized protectorate over the administration of the African territories.

(2) The establishment of strong stations by each power in its own territory to repress slave-hunting.

(3, 4, 5) The development of the country—Central Africa—by roads, railways, steamboat service supported by fortified posts, and telegraph lines to unite them.

(6) The organization of expeditions and flying columns to protect the communications and "support repressive action."

(7) The restriction of the importation of modern firearms and ammunition throughout the entire region in which the slave-trade is carried on.

This is a most attractive programme, if it can be carried out. Without good weapons the Arabs and their slave-hunting auxiliaries would not venture to attack the native tribes. Armed boats on the great lakes and fortified stations on the great highways would break the trade up effectively, while the growth of missions, of civilization, and of civilized trade would narrow its operations. To the carrying out of this programme the signatories pledged themselves with much detail and many provisions. At sea also, along certain stretches of coast, on the Indian Ocean and off Madagascar, the powers agreed to combine to put down slave-trading in small vessels.

Finally, those of the signatory powers whose domestic institutions recognized slavery agreed to forbid the importation of slaves, their transit, their departure, and the trade in them; while Zanzibar, Persia, and Turkey have bound themselves to assist actively in the suppression of this traffic. The provisions of the act to secure all these objects run through 100 articles.

THEODORE S. WOOLSEY.

Slavic Languages: a group of Indo-European languages which embraces Russian, Polish, Servian, etc. 1. Whether there ever was a unitary Slavic language is still a problem of philology. Theoretically, it is proper to speak, within the field of the Indo-European languages, of a unitary Slavic type, intimately related to the Baltic; and these two are often grouped as a Lithu-Slavic or Balto-Slavic branch of Indo-European, just as Sanskrit and Iranian are comprehended under Indo-Iranian. And the branch thus constituted undoubtedly stands in many characteristic phenomena nearer to the Indo-Iranian than to the Germanic, Celtic, Italic, or Greek. The Balts (i. e. the Lithuanians, Letts, and Prussians) have in common with the Slavs as against the remaining Indo-Europeans a richly developed vocabulary, similar formative suffixes, and noun and pronoun declensions closely related, especially in the formation of the so-called compound declension of the adjective with the pronoun stem *ja-*; e. g. *raū* *dydau* is in Lith. *gero-jo* (gen. of *geras*, good, and *jis*, he), in Slav. *dobra-jego*. In conjugation there are fewer points of contact, but the Lith. infin. in *-ti*, *-ti*, and the Slav. in *-ti* come close together: *dūti, dati*; likewise the supines in *-tum*: *tū*: *dūtum, datū*. In the consonant system Baltic shares with Slavic the loss of aspirates: Lat. *fero*, Gr. *φίρω*, Lith. *beriu*, Slav. *berq*; Lat. *fumus*, Gr. *θυμός*, Lith. (pl.) *dumai*, Slav. *dymū*; also the change of the palatal explosives to spirants somewhat as in Indo-Iranian: Gr. *ἐκάρω*, Lat. *centum*, Goth. *hunda-*, Lith. *szimtas* (*sz* = Slav. *š*), Slav. *sūto*; Lat. *hiems*, Gr. *χειμῶν*, Lith. *žiema*, Slav. *zima*; Gr. *γυμνάσιον*, Lat. *gymnaseo*, Lith. *žinoti*, Slav. *znati*. In syntax may be noted as common to both the use of the

genitive object in negative sentences, e. g. Lith. *nesa jis ne*
neg. acc. eum. voc. aetern. eum. cognoscetis
reg nej pažysta jos; bel jis je pažystate, Slav. *jako ne vidit*
jego ni znajetj jeho, vy že znajete i. Here *jos* and *jego* are objects in the genitive.

2. The Slavic type differs from the Baltic in two marked peculiarities: (a) the change of diphthongs into monophthongs; (b) by the finely organized laws of palatalization, i. e. by the regular change of *k, g, ch* to *č, ž, š* before the palatal vowels *e, ē, i, ī*, and by the later change of *k, g, ch* to *c, z, s* before the vowels *ē, i* which result from *oi, ai*. Here follow illustrations of both these typical phenomena: (a) Lith. *ai* corresponds to Slav. *ē* (a long, broad sound); *baisus*, terrible: *bēsiniū*, angry; *dailinti*, decorate: *dēlati*, carve; *mainyti*: *mēniti*, exchange; *raižyti*: *rēzati*, cut. Lith. *au* corresponds to Slav. *u* (orig. long); Lith. *ausis*: Slav. *ucho*, ear; *draugas*: *drugū*, friend; *jaunas*: *junū*, youth; *kaupas*: *kupū*, heap. Sometimes Lith. *au* corresponds to Slav. *y* (a deep guttural long *ū*); Lith. *au* is here plainly a resultant of *eu*; *krauti*: *kryti*, cover; *grauzti*: *grysti*, gnaw; *mauti*: *myti*, wipe; *raudoti*: *rydati*, moan. Lith. *ei* and *iē* correspond to Slav. *i*: *eiti*: *iti*, go; *mielas*: *milū*, dear; *teisus*: *tichū*, still; *pietūs* plur. dinner-time: *pišta* (from *pišta*), food. (b) The Slavic palatalization may be illustrated by the following parallels: Lith. *keturi*: Slav. *četyre*, four; *kibiras*:

šibiris, jug; *kirvarpa*: worm-hole: *šrūt*, worm, cf. Lith. *kirmis*: Lat. *vermis* for **kvermis*; *geidauti*, yearn: *o-šidati*, wait for; *gerli*, *geriu*, drink: *žrėti* (for *žerli*), *-žirg*, devour: *sarginti*, nurse: *stražiti* (for *storžiti*), watch over; vocat. *nebože*: *nebože* (from *nebogū*, poor). While this form of palatalization shows itself in all the Slavic languages and dialects, and consequently is their common property, dating from the time of their linguistic unity, there has been developed in one of the Baltic languages, viz., the Lettic, after the time of the division into the three chief branches, Lithuanian, Lettic, and Prussian, a phenomenon analogous to the Slavic palatalization, so that a *c* and *dz* correspond to the Slavic *č* (from *k*) and *ž* (from *g*); e. g. Slav. (Serv.) *čitarū*, whole: Lett. *ceeli*, firm (Lith. *kūlas*); Slav. *čirta*, mark: Lett. *cērtu*, cut, but Lith. *kertu*; Slav. *šrūt*: Lett. *cērms*, worm, but Lith. *kirmis*; Slav. *živū*: Lett. *dziwa*, vivus, but Lith. *gyvas*. With the primitive Slavic phenomena of palatalization belongs also the change *ch* (= Gr. *χ*) > *š*. The Slav. *ch* is, however, itself a product of *s*. Cf. Slav. *suchū*: Lith. *sausas*, to which the verbum causat. is Lith. *sausinti*: Slav. *sušiti*: Lith. *daušos* plur. air: Slav. *duchū*, but Lith. *daušinti*: Slav. *dušiti*.

A later palatalization, but one which nevertheless falls within the boundaries of the Slavic group, is the change of *k* > *c*, *g* > *dz* (*z*), *ch* (*s*) > *s* or *š*, which occurs in the special case where a guttural comes before an *ē* or *i*, resulting from original *ai, oi*. Cf. Goth. *haila*, which would be **kailas* in Lith. if it existed, and Slav. *čelū*, salvus; Lith. *kaina* (Lat. *poena*) and Slav. *cēna*, price; Lith. *gailus*, sharp: Slav. *dželiū*, violent. This appears prominently in suffixes and case-endings or verb inflexions; nom. plur. of *stogas*, roof, Lith. *stogai*: Slav. *stodzi* from *stogū*; dat. sing. Lith. *rankai* from *ranka*, hand: Slav. *račē* from *ranka*; imper.-optat. from *teka*, flow: *tici-ticēle*. The commonest appearance is in the Slav. suffixes *-ici*, *-ica*, *-ice*, *-ica*, which are used so widely as to give the impress of peculiarity to the entire body of the language. The corresponding Lith. suffixes show always *k*. Cf. Slav. *vēntci*, garland: Lith. *vainikis*; Slav. *juntci*, steer: Lith. *jaunikis*.

3. Another strong characteristic of the Slavic as against the Baltic type is the uniform loss of final *-s*. And as final *-ū* (< I.-E. *-ō, -ū*) and *-i* (I.-E. short *-i*) became silent at an early date, present Slavic word-forms often appear mutilated to the extent of the entire final syllable. Cf. Slav. *drugū* (now *drug*): Lith. *draugas* (usually *draugs*); Slav. *osilū* (now *osel*, *osiel*, *osai*): Lith. *asilas*; cf. also the casus obliqui, Slav. gen. sing. *nošti* (< *notji*): Lith. *nakties*, Slav. acc. sing. *nošti*: Lith. *naktį*. But as an offset to its poorer noun declension, Slavic has a fuller and clearer development of verb forms—a difference which constitutes one of the most difficult problems of philology. Cf. Lith. 3 pers. pres. *tekis*, 3 pers. *teka*: Slav. *tečēti*, *tečēt*, pl. *tekašt*; Slav. aorist formation *tekū-tekomū*, *tēchū-tēchomū*, *tekočū-tekočomū* and imperf. *tečaachū-tečaachomū* (also *tečēchū-tečēchomū*): Lith. perf. *tekėjau* and habitual imperf. *tekėdavau*. Lith. opt. *tekėtumei* (: supine *teketum + bei*) corresponds with change of category to Slav. condit. *tekū bi*. On the other hand, the Slavic language type lacks all except a few traces of the *s*-future: *tekēsū* must be expressed in Slav. either by the pres. *teka* (compounded with various prepositions to complete its meaning) or by the inf. *tekti* (= *teiji*, *tefi*, *teci*, *teci*) with the vb. *choštq*, will, *imamš*, have, or *bađq*, become. This last-mentioned distinction between the two language types is closely connected with the fine distinctions of the Slavic verb as regards the aspects of time-duration, which are not developed to the same degree in Baltic. In contrast to the Slavic use of the opt. as impv., *tici-ticēle* (where *i* and *ē* are parallel to Gr. opt. endings *-ous, -eure*), Lithuanian has a new formation from the true infinitive stem with *-k*: *tek-kikite*, *tekēkile*. A trace of the optative remains in *te-tekū*.

4. The separation of the Slavic from the Baltic must have been many centuries before our era. Many new acquisitions of sounds and vocabulary fall in the subsequent period of separation. The lexicographical material common to Slavic and Baltic shows no great or long-continued advance in culture from the primitive Indo-European period. The common Slavic vocabulary, on the contrary, is characterized by a great wealth of words important for the history of culture, and testifies to so long a period of common development and so rich and varied a community of life that the separation of the Slavs into various branches and peoples must be a comparatively very recent matter, and a result merely of local expansion. Especially worthy of notice is the borrowing of culture-words from the Teutonic, usually

reflected in the names given it. At the outset Dobrowský recognized in it a southern dialect, which he called at first Old Servian, later Bulgaro-Servian or Macedonian. Kopitar advanced the hypothesis of a Pannonian-Carantanian origin, which Miklosich followed with slight modifications. From these two scholars comes the name Old Slovenian. Šafařík defended the Old Bulgarian hypothesis, more on historical than on linguistic grounds. The name Old Slovenian is still used because in native sources the language was so called, *slověnskū* (*slovenica lingua*), but it is now known to have been a South Slavic dialect spoken somewhere in Macedonia in the ninth century, having the most points of contact not with modern Slovenian, but with Bulgarian, and some also with the present Servo-Croatian dialects. In location it probably formed a frontier between Bulgarian and Servo-Croatian; not necessarily in Northern Macedonia, however, for Constantine Porphyrogenitus speaks of Servians near Salonica. Aside from its philological importance, Church Slavonic is indispensable for the history of mediæval literature, serving beside the Christian Greek and Latin as the third international literary language. From the tenth century to the seventeenth a wealth of patristic literature, including lives, legends, and homilies, was assiduously translated—from the tenth to the fourteenth centuries especially in the South, but later also in Russia. It was also the state language in Bulgaria, Serbia, Bosnia, Russia (including Lithuania), Moldavia, and Wallachia; and while its supremacy, like that of Latin in the West, ceased with the end of the seventeenth century, yet even to-day the Russian literary language rests on centuries of Church Slavonic traditions as to forms, vocabulary, and orthography. See RUSSIAN LANGUAGE.

INDIVIDUAL SLAVIC LANGUAGES.

7. The southern Slavs, who in Byzantine times migrated in larger or smaller bands into the regions of the Hæmus, the Adriatic, and the Alps, are all called by Byzantine historians (Procopius, Menander, Theophanes, Theophylactus) by the name *Σλαβηνοί*, equivalent to Slav. *Slověne*, adj. *slověnskū*, a name continually met with in all historical periods in the Slavic South. The Bulgarians were originally called *Slověne* both by themselves and others, and their language *slověnskū*. The inhabitants of Styria, Carinthia, Carniola, and the coast around Trieste and Gorz are still called *Slovenet*, and their language Slovenian. The republic of Ragusa also, in spite of the identity of its language with the inland Servo-Croatian, held in its rich poetical literature of the fifteenth to the eighteenth centuries to the name of "Slovinian." Hence the Byzantine name *Σλαβηνοί* must have designated the whole of the southern Slavs. These tribes have never attained to a political or cultural unity. In Carinthia, Styria, and Carniola they early submitted to the Germans, and their closely resembling dialects formed the basis of the present Slovenian language. The dialect of Carniola forms the basis of the literary language. Slovenian was first treated grammatically by Kopitar (1808), later by Metelko, Dainko, Murko, and more recently by Miklosich, Levstik, and Šuman. A complete dictionary is (1895) being edited by Pleteršnik.

Nearest related to the Slovenian is the language of Slavonia in the old sense of the term, that is, of the region between the Save, Drave, and Mur (including scattered areas N. of the Mur in South Hungary). It probably extended formerly much farther toward the E., but the populations driven out of the Balkan Peninsula by the Turks entered the present Slavonia in such numbers that the Old Slovenian of the former kingdom of Slavonia is now restricted to the counties of Warasdin, Kreuz (Križevci), Agram, nearly to Belovar and Wirowitic. Since the end of the seventeenth century, this region has been known as Croatia and its language as Horvatian. Its literature began with the Protestant movement, and furnished in the seventeenth and eighteenth centuries a series of important prose works (also dictionaries by Belosteneć and Habdelić). It continued as a literary language until the rise of Illyrianism in Agram, after 1830, led to its displacement by the richer and more extended Servo-Croatian. As a popular dialect it still continues. It is often called the *kaj* dialect, from its use of the word *kaj* (quid?).

8. The Croatians proper and Servians extend farther south, roughly from the river Kulpa throughout Istria, the islands, the Croatian coast, Dalmatia, Montenegro, and throughout the interior (Bosnia, Herzegovina, Old Servia, Servia), and northward beyond the Save throughout Slavonia, Syrmia,

and Southern Hungary. The popular language deviates more or less from the literary dialect according to locality. That of Southwestern Serbia and Herzegovina, together with the Bezirk of Ragusa, is nearest in character to the literary dialect. Montenegrin offers many peculiarities in pronunciation and syntax. As a result of ecclesiastical and political separation, the Servians and Croatians, so nearly related in language, have had a very diverse historical development. Though both were originally converted by Rome, and both accepted the Slavic liturgy in the ninth century, the separation of the Church into Eastern and Western soon afterwards divided them into two hostile camps, Servia holding firmly to Constantinople and to Church Slavonic, while in the West the influence of Rome in ecclesiastical and public matters constantly increased. Not only in the old Romance cities of Dalmatia, but in the independent principality of Croatia, Latin was the ruling language in Church and state, though Church Slavonic still had a limited use in private congregational matters. After the end of the fourteenth century the popular language was used with Latin characters, at first in prose works for Christian instruction, but by the end of the fifteenth century for a poetical literature which reached its richest development in Ragusa in the seventeenth century. In 1595 Faustus Verantius (Vrančić) treated the "Dalmatian" (for so he called it) lexicographically and proved the Slavic loan-words in Hungarian. In 1604 appeared the first grammar of the "Illyrian" language by Bartholomew Kassi, and in 1649 a valuable dictionary by Jacobus Micalia. The literary life of Dalmatia spread to Bosnia in the sixteenth century—at least among Catholic adherents—and in the seventeenth and eighteenth books were printed in the popular language for circulation in Bosnia, with both the Cyrillic and Latin alphabets. The true founder of the popular language as a literary dialect for the Servians is Vuk Stef. Karadžić, who published much popular material, principally songs, in the second and third decades of the nineteenth century, and based the Cyrillic orthography on phonetic principles. Since this Servian dialect of Vuk is the same as the Dalmatian of the fifteenth to the eighteenth centuries (later used also in Bosnia), which, as above mentioned, was introduced into Agram in 1835 under the name of Illyrian, these two long separated branches have at last been united again into the Servo-Croatian literary language. Though this still preserves a dualism in name (Servian and Croatian), and in the use of different alphabets (Cyrillic and Latin), it is one in grammar and vocabulary. Vuk prepared a small grammar and an excellent dictionary (2d ed. 1852). The great *Academic Dictionary of the Croatian or Servian Language*, begun by G. Daničić (1882), is being published by the South Slavic Academy in Agram.

9. Most peculiar in its development has been the language of the Bulgarians, who borrowed their name from their Turkish conquerors, the Bulgars. They live to the number of about 3,000,000, E. of the Servians on the lower Danube in the Balkan and Rhodope Mountains, in Roumelia nearly as far as Adrianople, and in a large part of Macedonia. They were originally composed of seven Slovenian tribes, whose branches may have extended to the south as far as Greece, and northward as far as Eastern Pannonia and Transylvania; the resulting dialectal differences are not yet wholly obliterated. Besides the use of a post-positive article, Bulgarian has lost the true Slavic declension, replacing it by prepositions with the general case, which gives it a strange appearance in comparison with all other, even southern, Slavic dialects, with which in other ways it has many points of contact. This phenomenon probably dates back to the fourteenth century, and may have been partly due to the influence of Roumanian, in which it certainly developed much earlier. The Slavic conjugation, however, except for the loss of the infinitive, has been retained in Bulgarian in its old form, agreeing with the eastern Servo-Croatian dialects even in the formation of the future by means of the auxiliary *šā* (from *chošag*), and with all South Slavic dialects in the use of the conjunction *da* with object clauses (instead of *že* *iz* in Northwest Slavic, and *čto* in Russian). As noted above, Bulgaria was for a long time the center of Church Slavonic literary activity (under the Emperor Simeon, 927 A. D., and his immediate successors). As a result, the popular language does not appear in literature before the seventeenth century, and must be gathered from fragments found scattered through the Church Slavonic texts. The language was made known to the literary world by Vuk Stef. Karadžić and Kopitar, having been scarcely known to Dobrowský, and has been investigated

The Polish language is characterized most strongly among all the living Slavic languages by retention of the original Slavic nasalization: cf. prim. Slav. *dǫbŭ-dǫba-dǫbu*, Polish *dąb-debu*; prim. Slav. *rǫka-rǫkǫ-rǫkŭ*, Polish *ręka-ręke-ręk*. The Polish is rich, almost too rich, in sibilants, the original Slav. groups *te-ti*, *de-di* being assibilated: *cie* (i. e. *čē*), *ci* (i. e. *čī*), *dzie* (i. e. *džē*), *dzi* (i. e. *džī*); so also *s*, *z*, before palatal vowels become *š*, *ž*; *siano* (i. e. *šano*) *ziemia* (i. e. *žēma*). Polish differs widely from Czech in the treatment of the old Church Slav. vowel *ě*, making it now *ie* (before soft sounds), now *ia* (before hard); thus *wiatr* (Czech. *větr*, genit. *větru*), but *wierny*, *wierzyć* (Czech. *věřiti*). Polish forms from *or* + cons. and *ot* + cons. not *ra-ta*, like Cecho-Slovak. and South Slav., but *ro-to*, like Lusatian-Servian; *er* + cons. and *el* + cons. do not yield *ré* + cons., *lé* + cons. as in Czech and South Slav., but *re* + cons., *le* + cons., e. g. Czech *březa* or *bríza*, Pol. *brzoza*. Polish has no *r*-, *l*-sonans. In the umlaut of *ie* > *io* Polish is akin to Russian. Polish has retained *t* (hard) and *l* (palatal), whereas Czech has in recent centuries entirely relinquished *ř*. Beside other peculiarities of the Polish is to be noted its constant accentuation of the penultimate syllable, as distinguished from Czech and Lusatian-Servian, which accentuate the first; also its lack of distinctions in quantity as contrasted with the many long syllables, notably final ones, in Czech.

14. The Casubian was regarded by Kryński, Biśkupski, and Pobłocki as a dialect of Polish, but by most scholars has been more correctly regarded as the last remnant of the language of those Slavs who formerly extended throughout Pomerania and beyond the Oder to the Elbe. The Casubians of to-day (also called Slowincians or Slowincians) are a poor fishing people around the Gulf of Dantzig and in some places in the provinces of West Prussia (Putzig, Neustadt, Karthaus, Dantzig, Berent, Konitz, Schlochau) and Pomerania (Lauenburg, Stolp, Bütov), and number over 150,000. A comparison of their language (treated by Cenowa, Hilferding, Biśkupski, and others) with Polabian (as set forth by Schleicher) shows conclusively that Polabian and Pomeranian had much in common that can not be found in Polish. A most serviceable dictionary of Casubian by Ramult was published by the Cracow Academy in 1893.

15. For an account of the Russian dialects, see RUSSIAN LANGUAGES.

V. JAGIĆ.

Slavo'nia [= Late Lat., deriv. of *Slavus*, Slav; cf. O. Bulg. *Slavie nini*; Russ. *Slavya nini*, Slav, Slavonian; perhaps connected with O. Bulg. *slovo*, word, *slava*, glory]: a territory of Austria-Hungary, forming with Croatia a province attached to Hungary; bounded N. by the Drave and S. by the Save, and E. by the Danube. Area, 9,106 sq. miles. A branch of the Carnian Alps enters Slavonia from the W., and traverses it in its whole length, forming the watershed between the Drave and the Save, and terminating somewhat abruptly on the banks of the Danube. These mountains, which nowhere rise above 2,700 feet, are rich in copper, iron, lead, and beautiful marble, and their slopes are clothed with fine timber-yielding forests, vineyards which produce a sweet, strong, richly flavored wine, and orchards in which apples, pears, cherries, and peaches, figs, oranges, and walnuts ripen to perfection. Along the rivers extend low, rather marshy, but very fertile plains, where large crops of wheat and maize are raised and immense herds of cattle and swine reared. Of manufactures there are almost none; some linen fabrics are made from the excellent flax and hemp which are raised, but only for home use. The inhabitants, who call themselves *Slavonatz* and their country *Slavonska*, are at once warlike and dreamy, fond of music, poetry, and dancing, excelling in all kinds of horsemanship, and preferring the life of the shepherd to that of the tiller of the soil. They are deeply attached to their fatherland and proud of their nationality, and of late political ideas and passions have begun to play a conspicuous part in their lives. See CROATIA.

Revised by M. W. HARRINGTON.

Slavs [from Germ. *Sklave*, *Slave*, from the Slavic forms. See SLAVONIA]: a race of Indo-European relationship, characterized chiefly by their speech and constituting three-tenths of the population of Europe, and divided into three main branches—Eastern, Western, and Southern. To the first belong the Russians and Ruthenians; to the second, the Poles, the Czechs, the Slovaks, and the Wends; to the third, the Bulgarians, the Servians and Croats, and the Slovenes. For the Slavic population of Austria-Hungary, Prussia, and Russia, see the articles on those countries.

No information is given, even by legends, as to the first appearance of the Slavs in Europe. In the fourth century they were found in great numbers in the neighborhood of the Carpathians, and that is supposed to have been one of their earliest homes. Thither point the legends of many Slavonic peoples, especially the Poles and Czechs, and thence the Slavonic settlers appear to have spread northward to the Baltic and southward to the Adriatic. The earliest authentic records of the Slavs are given by Procopius, Jordanes, Agathias, the Emperor Maurice, and other writers during the second half of the sixth century. These authors all lived in Byzantium or in Italy, and were personally acquainted only with the Southern Slavs, who dwelt on the lower Danube and spread through ancient Mœsia and Pannonia. The Northern Slavs they knew by report only. No political unity seems ever to have existed among these early Slavs, but their different bodies consolidated at various periods between the seventh and eleventh centuries into monarchies, of which most have virtually disappeared. To the early Slavs, Jordanes and some other writers give the name of Wends, by which name the Slavonic inhabitants of Lusatia are still known to their German neighbors. This designation, under various kindred forms, appears to have been applied to Slavs by foreigners, just as that of Welsh (*Wâlsh*) was given by the Teutonic to the Latin-speaking peoples.

Of the ancient Slavs little information can be obtained except from the writings of Greeks, Germans, Arabs, and other foreigners. They appear to have differed but little in the various lands which they occupied, everywhere bearing the character of being a brave and hardy race, given to agriculture, and of a peaceable nature, except where they were influenced by more martial neighbors. Some modern writers suppose that the Slavs formed into clans, others that the foundation of Slavonic society was the family community. Among the Western Slavs, at least, a cluster of such communities formed a *jupa*, or district, at the head of which was a *jupan*, or chief, and in its center a *grad*, or town. The mode of life among all the Slavonic tribes was patriarchal, the father ruling his family with despotic power. Polygamy prevailed among them in heathen times, and also a kind of sutteeism, but women do not seem to have occupied an altogether degraded position. Of Slavonic heathenism not much is known, but its deities appear to have been for the most part personifications of nature-forces. Vague recollections survive of Svarog, the heaven-god, answering to the Greek Ouranos, the Vedic Varuna. He appears to have given place, in some parts, to a solar deity, Dazhbug, together with whom, as the representative of the sun, a Khors is mentioned. Another solar deity was Volos or Voles, the special protector of cattle, surviving in Christian times as St. Blasius or Vlasy. Kupalo and Garilo are supposed to have been representatives of the summer sun, the fertilizer of the earth. Fire is said to have been worshiped under the name of Ogon, answering to the Vedic Agni, and there was a wind-god, Stribog; but the chief deity of the Northeastern Slavs was Perun, the thunder-god, answering to the Teutonic Thor, and supposed to be the European representative of the Vedic Parjanya. Among the Western Slavs other deities were worshiped, such as Radigost and Sviatovit, and the three-headed Triglav, of whose images detailed accounts are given by old writers. These Western Slavs appear to have had temples and priests, but it is doubtful whether this was the case among their Eastern brethren. Of inferior deities the memory is still preserved in the belief of the common people of all Slavonic lands in Rusalkas, Vilas, and many other supernatural beings supposed to haunt woods, waters, and pastures. The Western Slavs appear to have been the first to accept Christianity, many of the Moravians, for instance, having been converted as early as the seventh century, their religious teachings coming from the West; but the submission of the great body of Slavs dates from the mission of the Greek monks Cyril and Methodius in the ninth century. See SLAV LANGUAGES.

Revised by M. W. HARRINGTON.

Sleep [O. Eng. *slēp*; O. Sax. *slāp*; O. H. Germ. *slāf* (> Mod. Germ. *schlaf*); Goth. *slēps*; cf. Lat. *la'bi*, *lapsus*, glide, slide, fall down, whence Eng. *lapse*]: a condition of the organism, normal, and occurring generally periodically, in which there is a more or less complete suspension of consciousness and the power of voluntary motion. It is somewhat difficult to analyze the various phenomena which go to make up the condition called sleepiness. The most

preconscious sensations are an impression of weight in the upper eyelids, and of a general relaxation of the muscles of the body; but there is besides an internal feeling of surprise and horror, to describe which is by no means easy. Along with this languor there is a general consciousness of all the senses, which increases the separation of the mind from the external world. The idealist seems loose to engage the attention, and the most exciting conversation no longer interests. For a time, indeed, such circumstances may dissipate the inclination for sleep, but eventually nature claims her ascendancy and consciousness is lost. Before this even there is usually yawning—a phenomenon strongly indicative of a wearied attention—the head nods and droops upon the breast, and the body assumes that position which is most conducive to muscular inactivity. The order in which the muscles lose their power is in general well marked, and leaves a distinct relation, as Lavoisier has pointed out, to the importance of their functions. The muscles which move the arms and legs become relaxed before those which support the head, and the latter before those which maintain the symmetry of the back. This, however, is not always the case.

During sleep the respiration is slower, deeper, and usually more regular than during wakefulness. The vigor of the processes is lessened, and therefore there is a diminution of the pulmonary exhalations. Owing to the general muscular torpor which prevails, mucus may accumulate in the bronchial tubes and require to be expectorated on awakening. The circulation of the blood is slower. The heart beats with more regularity, but with diminished force and frequency. As a consequence, the blood is not distributed to distant parts of the body so thoroughly and rapidly as during wakefulness, and accordingly the extremities readily lose their heat. Owing to the reduction in the activity of the respiratory, circulatory, and heat-producing functions, the temperature of the whole body falls, and richness of the atmosphere is less easily resisted. The functions of the several organs concerned in digestion indirectly have their activity increased during sleep. The blood which is thus directed from the brain goes, as Durham has shown, to the stomach and other abdominal viscera, and hence the quantities of the digestive juices are augmented, and the absorption of the nutritious elements of the food promoted. The urine is excreted in less quantity during sleep than when the individual is awake and engaged in mental or physical occupation, because the wear and tear of the system is at its minimum.

The nervous system continues in action during sleep, though generally with somewhat diminished power and sensibility. The reflex functions of the nerve-centers are still maintained, and thus various movements may be executed without consciousness being awakened. Somnambulism is a condition of exaltation in the functions of nerve-centers, without the controlling influence of the cerebrum being brought into action; but aside from this rather abnormal phenomenon, there are others which are entirely within the range of health. Thus, if the position of the sleeper becomes irksome, it is changed; if the feet become cold, they are drawn up to a warmer part of the bed; and cases are recorded in which individuals have risen from bed and emptied a distended bladder without awaking, as well as performing many other complicated and apparently voluntary acts.

The ability to be readily roused through the senses constitutes one of the main differences between sleep and stupor. Relative to the different faculties of the mind as affected by sleep great variations are observed. It has been thought by some authors that several of them are really excited above the standard attained during wakefulness, but this is probably a wrong view. The predominance which one or two mental qualities apparently assume is not due to any absolute exaggeration of power, but to the suspension of the action of other faculties which, when we are not asleep, exercise a governing or modifying influence. Thus, the *imagination*, as regards the imagination, which appears to be most lively in dreams, we find that, when we carefully study its manifestations in our own persons, although there is often greater brilliancy in its vagaries, uncontrolled as it is by the judgment, the pictures to which it gives rise are usually grotesques and silly in the extreme. Even though the train of ideas excited in the dream seems to be rational and coherent, we are fully conscious on awakening that we are capable of doing much better by intentionally setting the fancy in action and governing it by our will and judgment. Owing to the fact that these two faculties of the mind are

invariably acting normally during sleep, the imagination is left absolutely without controlling influence. Indeed, we are often cognizant in those dreams which take place when we are half awake of an inability to direct it.

That the imagination may in its flight during sleep strike upon fancies which are subsequently developed by the reason into solid and valuable ideas is very probable. It would be strange if, from among the innumerable absurdities and extravagances in which it utters something fit to be appreciated by the mind should not occasionally be evolved, and there are many instances of the starting point of important mental operations having been taken during sleep.

As regards the memory in dreams, it is undoubtedly exercised to a considerable extent. In fact, whatever sign of activity the mind may then exhibit is based upon events the recollection of which has been retained. But there is more or less error mingled with a small amount of truth. The unbridled imagination of the sleeper so distorts the simplest circumstances as to render their recognition a matter of no small difficulty, and thus it scarcely if ever happens that events are reproduced during sleep exactly as they would be recalled by the mind of the individual when awake. Frequently, also, recent events which have made a strong impression on our minds are forgotten, as when, for instance, we dream of seeing and conversing with persons not long dead. Yet there are many instances on record of knowledge which had passed out of the mind being re-acquired during sleep.

During sleep the power of bringing the judgment into action is suspended. We do not actually lose the power of arriving at a decision, but we can not exercise the faculty of judgment in accordance with the principles of truth and correct reasoning. An opinion may therefore be formed during sleep, but it is more likely to be wrong than right; and no effort that we can make will enable us to distinguish the false from the true, or to discriminate between the possible and the impossible.

As regards the will, very opposite opinions are entertained relative to its activity. In the course of his remarks on sleep, Darwin repeatedly alleges that during this condition the action of the will is entirely suspended, but he falls into the singular error of confounding volition with the power of motion. Thus he says: "When by one continued posture in sleep some uneasy sensations are produced, we either gradually awake by the exertion of the volition or the muscles connected by habit with such sensations alter the position of the body; but when the sleep is uncommonly profound and these uneasy sensations great, the disquieting member or members is produced. Here the desire of moving the body is painfully excited, but the power of moving it, or volition, is incapable of action until we are awake."

Duguid Stewart contends that during sleep the power of volition is not suspended, but that those operations of the mind and body which depend on volition cease to be exercised. In his opinion, the will loses its influence over all our powers both of mind and body in consequence of some inexplicable physical alteration in the system.

It seems, therefore, that during sleep the three great functions of the mind are differently affected. (1) Feeling, embracing sensation and emotion, is suspended in part so far as the first is concerned, but is in full action as regards the second. We do not see, hear, smell, taste, or enjoy the sense of touch in sleep, although the brain may be aroused into activity, and we may awake through the excitations conveyed to it by the special senses. The emotions have full play, unrestrained by the will, and governed only by the imagination. (2) The will or volition is entirely suspended. (3) The thought or intellect is variously affected. The imagination is active, and the memory may be exercised to a great extent, but the judgment, perception, conception, abstraction, and reason are weakened, and sometimes altogether lost.

As to the immediate causes of sleep, it was formerly almost universally attributed to an increase in the amount of blood in the brain, but others hold that sleep is the direct consequence of a diminished amount of blood in the cerebral blood-vessels, and that unless this diminution takes place sleep is impossible.

Revised by J. MARK BALDWIN.

Sleeper: any one of several sharks or fishes: (1) Either one of the nurse-sharks. (See NURSE-SHARK.) (2) In some of the West Indian islands a gobioid fish of the sub-family *Eleotridinae*; these rarely exceed a foot in length, and are of an elongated form, with two separated dorsal fins, the first of which has six slender spines, and thoracic ventral fins, which have each a spine and five rays.

Sleep of Plants: the nocturnal condition of many plants. Many leaves assume a particular position at nightfall or when placed in a darkened room, as is notably the case with certain sorrels (*Oxalis*), clovers (*Trifolium*), sensitive plants (*Mimosa*), and other *Leguminosae*. Many flowers close at night and open again in the morning, as of species of *Portulaca* and *Oxalis*, and the dandelion and many other *Compositae*. C. E. B.

Sleepy Eye: village; Brown co., Minn.; on Sleepy Eye Lake, and the Chi. and N. W. Railway; 48 miles W. of Mankato (for location, see map of Minnesota, ref. 10-D). It is in an agricultural region, and contains 6 churches, a State high school, 2 parochial schools, 6 warehouses and grain elevators, flour-mill, brewery, creamery, electric lights, a State bank with capital of \$25,000, a private bank, and two weekly newspapers. The place was named in honor of Ish-a-hum-bak, an Indian chief who was friendly to the whites during the massacre of 1861, the name meaning "Man whose eyes have appearance of sleep." Pop. (1880) 997; (1890) 1,513; (1895) estimated, 2,200.

EDITOR OF "DISPATCH."

Sleidan, JOHANN, whose true name was PHILIPPSOHN; historian; b. at Schleiden, 42 miles S. W. of Cologne, 1506; studied at Louvain and Paris and jurisprudence at Orleans; was secretary to Cardinal du Bellay, minister to Francis I., King of France (1536-41), although at Louvain he had imbibed Protestant opinions; was the representative of Francis I. at the Diet of Regensburg; led a wandering life till 1543 when he settled in Strassburg, which thenceforth was his home. He was appointed historiographer by the princes of the Smalkaldian League; represented Strassburg at the Council of Trent (1551), and on his return became Professor of Law. D. in Strassburg, Oct. 31, 1556. His fame rests upon his great history, *De statu religionis et reipublice Carolo Quinto Cesare commentarii* (Strassburg, 1553-56; best ed. by Chr. C. am Ende, 3 vols., Frankfurt, 1785-86), which gives a history of the Reformation from 1517 to 1556, resting on documentary evidence. It remains "the most valuable contemporary history of the Reformation, and contains the largest collection of important documents." It was translated into French (Geneva, 1557; new trans. The Hague, 1787), Italian (Florence, 1557), English (*A famous cronicle of our time, called Sleidan's commentaries*, etc., translated by John Daus, London, 1560; same, edited by Edmund Bohun, under title *The General History of the Reformation, etc., 1517-1556, with continuation to 1563*, 1689), and German (Frankfort, 1567, n. e. Halle, 1770-73, 4 parts). Another famous work, often reprinted, was his *De quatuor summis imperiis, Babylonico, Persico, Graeco, et Romano* (Strassburg, 1556; n. e. Amsterdam, 1705; Eng. trans. *The Key of History*, London, 1627, new trans. 1695; French trans. Geneva, 1563). His *Opuscula* appeared at Hanau, 1608. See his *Life* by H. Baumgarten (Strassburg, 1878), who also edited his correspondence (*Sleidans Briefwechsel*, 1881).

SAMUEL MACAULEY JACKSON.

Slemmer, ADAM J.: soldier; b. in Montgomery co., Pa., in 1828. He graduated from the U. S. Military Academy July 1, 1850, and was appointed brevet second lieutenant in the artillery; first lieutenant 1854. Detailed for duty at West Point in 1855, he served as Assistant Professor of Geography and History a year, and of Mathematics 1856-59. In the latter year he was ordered to Fort Moultrie, S. C., and in 1860 was transferred to Florida, where, in 1861, he commanded the small body of U. S. troops in Pensacola harbor, occupying with them Fort Barrancas and the neighboring feeble barracks. When intelligence of the surrender of the

Pensacola navy-yard to the Confederates reached him, he transferred (Jan. 10) his command to Fort Pickens, opposite, which action prevented the seizure of that important work. In May, 1862, he was attached to Gen. Buell's army, and participated in the siege of Corinth and in the subsequent movement to Louisville, Ky., and to the relief of Nashville, Tenn. He was commissioned a brigadier-general of volunteers Nov. 29, 1862, and engaged in the battle of Murfreesboro Dec. 31, where he was severely wounded and incapacitated from further active service in the field. He was promoted lieutenant-colonel Fourth Infantry Feb., 1864, and in Aug., 1865, he was mustered out of the volunteer service, and breveted colonel and brigadier-general. D. at Fort Laramie, Kansas, Oct. 7, 1868.

Sleswick: another spelling of SCHLESWIG (q. v.).

Slickensides: a peculiar polished and striated surface found commonly on the wall-rocks of mineral veins or faults, and where slate, shale, coal, and other fine materials have been crumpled and folded by pressure. Not unfrequently a foreign body, such as a concretion, shell, or nut lying in an argillaceous rock of which the particles have been moved on each other with great force, shows the polished striated surface to which this name has been given.

Slidell, JOHN: statesman; b. in New York about 1793; graduated at Columbia College 1810; settled at New Orleans, where he became a distinguished lawyer; U. S. district attorney 1829-33; member of Congress 1843-45; appointed minister to Mexico 1845, but not received by the Mexican Government; was U. S. Senator 1853-61, but withdrew in consequence of the secession of his State, which he had done much to promote. Sailing from Charleston as commissioner of the Confederate government to France, he and his associate, James M. Mason, ran the blockade and embarked at Havana on the British steamer Trent. On Nov. 8, 1861, Capt. Wilkes, of the U. S. frigate San Jacinto, stopped the Trent, seized the two commissioners, and brought them back to the U. S., where they were held prisoners at Fort Warren in Boston harbor. Bitter denunciations of the seizure appeared in the British press, and the attitude of the British Government was for the moment very threatening, but the U. S. disavowed the act of Wilkes and released the prisoners Jan. 1, 1862, thus putting an end to the difficulty. After the war Slidell settled in London, where he died July 29, 1871.

Slide-rule: an instrument for solving arithmetical problems where approximate results are sufficiently accurate. The form invented by William Oughtred (1573-1660) is best known, and the more precise one introduced by Edwin Thacher in 1885 is much used by engineers. The principle is that of logarithms, the divisions on one scale being those of the logarithms of numbers from 1 to 100, or from 1 to 1,000, while the numbers themselves are marked at the divisions of the other; by sliding one scale along the other the products and quotients of two numbers may be read off by inspection.

MANSFIELD MERRIMAN.

Sligo: county in the province of Connaught, Ireland, bordering N. on the Atlantic. Area, 721 sq. miles. The surface rises from the coast toward the E. and N. E., reaching 1,778 feet in the Ox Mountains. The western part is level, the soil mostly consisting of a light sandy or gravelly loam, interspersed with patches of bog. There are, however, districts with a deep and rich soil well adapted for tillage. Agriculture is the principal occupation, especially cattle-breeding and dairy-farming. Some coarse woollen stuffs are manufactured, and fishing is carried on. Two members are returned to the House of Commons. Pop. (1891) 98,013. Principal town, Sligo, at the mouth of the Garvogue, 137 miles by rail N. W. of Dublin, at the head of the Bay of Sligo (see map of Ireland, ref. 6-F). It has a good harbor, and exports cattle, grain, butter, etc. Sligo has a Roman Catholic cathedral and a modern town-hall. Pop. (1891) 10,110.

Slime-moulds: the *Mycetozoa* or *Myxomycetes*, a group of organisms of doubtful affinity; when referred to the animal kingdom called by the former name, when to the vegetable kingdom by the latter. They have hitherto been commonly regarded as plants, but are more probably related most closely to the rhizopods among animals. In their growing stage they consist of a naked mass of protoplasm of indefinite size and shape, and here their resemblance to the rhizopodous infusorians is evident; but in their reproductive stage they are definitely circumscribed masses of dry spores, here reminding one of some of the puff-balls

Didymopogon among the higher fungi. This latter reconsideration, which is now known to be altogether superficial, caused the earlier botanists to group the slime-moulds with the higher fungi. They have been studied almost exclusively by botanists who have written mostly all the literature relating to them, and as a consequence the treatment described above here is necessarily belated rather than adequate.

The reproductive or growing stage of a slime-mould, known as the plasmodium (Fig. 1), varies in size from minute amoeba-like masses to those as large as one's hand or larger. They may be dactylid and continuous or loosely reticulated, and in consistency they vary from extreme wateriness to a considerable toughness and firmness.

They are usually yellowish or reddish. Numerous nuclei are present, although not easily demonstrated. Plasmodia are mostly saprophytic in habit, and are to be found in decaying bark and wood. They move freely with an amoeba-like motion, and thus come to the surface or move from place to place. Hildreth observed the rapidity of the mass-movement of the plasmodium of *Didymopogon verpa* to be at the rate of about 2 mm. per minute. In this way they are able to make considerable distances during favorable (damp and quiet) weather. They are often found upon living stems and leaves, to which they must have moved a foot or more from the decaying matter in which they grow.

When they have reached maturity they come to the surface, and, losing water by evaporation, they divide their protoplasm into minute rounded portions, each of which secretes a wall of cellulose around itself, thus constituting a spore. At the same time the general contour of the plasmodium assumes a definite and in some cases a uniform outline which is characteristic of this stage, while its hardened boundary is known as the peridium. Internally other changes have taken place. The protoplasm usually secretes a more or less extended mass of filaments—the capillitium—which serves to give strength to the sporangium. The substance of the filaments is cellulose, or nearly allied to it, and is often incrustated or rimmed with lime.

The spores germinate by the bursting of their walls and the escape of the protoplasm as amoeba-like bodies, each at length provided with a cilia, which grow in size and coalesce into plasmodia. At one time it was thought that this coalescing method of the nature of conjugation in some of the green algae (*Volvox*), but this has been shown to be erroneous. It is not conjugation at all, but the simple fusion of two or more soft masses of protoplasm.

About 400 species of proper slime-moulds have been recognized, and if some closely related forms (*Manduca*) are added the number will be increased by about fifty. They are classified almost entirely upon characters derived from their spore-bearing stage.

Hustedt in 1975 made a thorough revision of the group, and proposed an arrangement based largely upon the color of the spores. This was followed by Berlese. Zopf made

many changes in the system, standardizing the color of the spores for the principal characters. He also adopted a modification of Zopf's system. The following arrangement is based upon Berlese's, with some changes.

Class 5 (EXOCYSTES). Plasmodium internal and saprophytic, its surface eventually forming a membrane (peridium), its interior developing (1) spores, and mostly (2) a filamentous framework (capillitium). Spore-bearing stage ("fruit") either (1) of irregular shape, plasmodium-like or plasmodia-like, or (2) sporangia of uniform and regular shape, which may be (a) single (an orthosporangium) or (b) coalesced into a compound body (an athallium). From a millimeter to many centimeters in extent.

Order CHARADRIACEAE (EXOCYSTES). Spores external.

Family *Choristogonaceae*. Spores borne singly on pedicels.

The genus *Choristogon* of Schreier (*Choristogon* of other authors) is the sole representative of this family (Fig. 2).

Order CEBRIACEAE (EXOCYSTES). Spores internal, in capillitium.

Family *Lecanaceae*. Peridium uniformly thickened (no network), when ripe irregularly torn. "Fruit" a plasmodia-like, sporangium, or athallium. The four genera *Lecan*, *Protodermis*, *Tubulin*, and *Lecanodermis* are represented by species of mostly small organisms.

Family *Chlorophyllum*. Peridium with internal thickenings, the thin parts breaking away when ripe, forming irregular projections. "Fruit" consisting of numerous sessile, globose, or cylindrical sporangia coalesced into an athallium.

Two genera—*Enteridium* and *Chlorophyllum* (Fig. 3)—represent this family.

Family *Cerberiaceae*. Peridium with internal thickenings, the thin parts breaking away when ripe, forming a network. Orthosporangia stipitate.

The two genera are *Dictydium* (Fig. 4) and *Cerberia*.

Order TAREBIACEAE (EXOCYSTES). Spores internal, capillitium present, peridium or capillitium sometimes with incrustations of lime.

Family *Trichaceae*. Without lime (except in *Perichone*), capillitium of tubes, free or combined into a network, the tubes mostly with rough prickly, plicate, or spirally thickened walls; no columella. "Fruit" an orthosporangium, rarely an athallium or a plasmodium.

Arceuthobium (Fig. 5), *Lygogon*, *Trichum*, and *Hemitrypa* (Fig. 6) are the most common genera in the U. S.

Family *Reticulariaceae*. Without lime, capillitium of solid filaments combined into an intricate network; columella present. Sporangia naked, many coalesced into an athallium.

The three genera are *Reticularia*, *Amurensia*, and *Siphonoglyphum*.

Family *Stemonitaceae*. Without lime, capillitium a net of solid filaments springing from the columella. Sporangia simple.

The commonest genera are *Leptodermis*, *Leptotrichum* (Fig. 7), and *Stemonitis*.

Family *Sporangioaceae*. With lime in the peridium or columella (not in capillitium); capillitium a net of much-

FIG. 1.—Plasmodium of *Didymopogon verpa* (x 100).

The plasmodium of *Didymopogon verpa* is at the rate of about 2 mm. per minute. In this way they are able to make considerable distances during favorable (damp and quiet) weather. They are often found upon living stems and leaves, to which they must have moved a foot or more from the decaying matter in which they grow.

When they have reached maturity they come to the surface, and, losing water by evaporation, they divide their protoplasm into minute rounded portions, each of which secretes a wall of cellulose around itself, thus constituting a spore. At the same time the general contour of the plasmodium assumes a definite and in some cases a uniform outline which is characteristic of this stage, while its hardened boundary is known as the peridium. Internally other changes have taken place. The protoplasm usually secretes a more or less extended mass of filaments—the capillitium—which serves to give strength to the sporangium. The substance of the filaments is cellulose, or nearly allied to it, and is often incrustated or rimmed with lime.

The spores germinate by the bursting of their walls and the escape of the protoplasm as amoeba-like bodies, each at length provided with a cilia, which grow in size and coalesce into plasmodia. At one time it was thought that this coalescing method of the nature of conjugation in some of the green algae (*Volvox*), but this has been shown to be erroneous. It is not conjugation at all, but the simple fusion of two or more soft masses of protoplasm.

About 400 species of proper slime-moulds have been recognized, and if some closely related forms (*Manduca*) are added the number will be increased by about fifty. They are classified almost entirely upon characters derived from their spore-bearing stage.

Hustedt in 1975 made a thorough revision of the group, and proposed an arrangement based largely upon the color of the spores. This was followed by Berlese. Zopf made

FIG. 2.—*Choristogon* (x 100). Spore-bearing stage, enlarged five times.

FIG. 3.—*Enteridium* (a) and *Chlorophyllum* (b) (x 100). Spore-bearing stage, enlarged five times.

FIG. 4.—*Dictydium* (x 100). Spore-bearing stage, enlarged five times.

FIG. 5.—*Arceuthobium* (x 100). Spore-bearing stage, enlarged five times.

The plasmodium of *Didymopogon verpa* is at the rate of about 2 mm. per minute. In this way they are able to make considerable distances during favorable (damp and quiet) weather. They are often found upon living stems and leaves, to which they must have moved a foot or more from the decaying matter in which they grow.

Hustedt in 1975 made a thorough revision of the group, and proposed an arrangement based largely upon the color of the spores. This was followed by Berlese. Zopf made

FIG. 6.—*Hemitrypa* (x 100). Spore-bearing stage, enlarged five times.

branched threads extending from the columella to the peridium. Sporangia single or coalesced into an aethalium.

Diachea and *Spumaria* (Fig. 8) are the genera.

FIG. 8.—*Spumaria alba*, natural size.

Family *Didymiaceae*. With lime (mostly in crystals in the outer wall of the peridium); capillitium of delicate tubes or filaments, without lime, extending from the columella or base of the sporangium to the peridium. Columella none or short, hemispherical, or orbicular. "Fruit" an orthosporangium or a plasmodiocarp.

The more important genera are *Didymium* and *Chondrioderma* (Fig. 9).

Family *Physaraceae*. With lime in granules; capillitium a net of hyaline, thin-walled, broad tubes, usually filled with lime; columella usually wanting. "Fruit" mostly an orthosporangium, less commonly a plasmodiocarp or an aethalium.

The common genera of this large family are *Tilmadoche*, *Leocarpus*, *Physarum* (Fig. 10), *Badhamia*, and *Fuligo* (Fig. 11).

Allied to the slime-moulds proper are two other groups, the *Acrasieae* and *Phytomyxinae*—classes they may conveniently be called—which are to be regarded as simpler and lower than the foregoing. They may be noted as follows:

Class *ACRASIEAE*. With no true plasmodium, the amoeboid swarm-spores not fusing; saprophytic; in fruit consisting of rounded heaps of free spores.

FIG. 9.—*Chondrioderma floriforme*, enlarged fifteen times: 1, unopened; 2, 3, ruptured, showing spores; 4, showing columella.

Several genera of these low organisms, falling into two groups, are known. They occur upon manure and other decaying matter.

Class *PHYTOMYXINAE*. With a true plasmodium, parasitic in the cells of higher plants, in fruit dividing into a mass of spores. The organisms here brought together are but obscurely known. *Plasmodiophora brassicae* (Fig. 12) occurs in the roots of cabbage, causing club-root. *Phytomyxa leguminosarum* causes the root-tubercles of clover and many other leguminous plants.

Zopf has added many other organisms to the slime-moulds, such as *Vampyrella*, *Bursulla*, *Colpodella*, *Protomonas*, *Protomyxa*, etc., whose animal nature has never been seriously doubted and whose affinities to the higher slime-moulds are evident.

As to their place in nature, the writer must agree with de Bary in placing them "outside the limits of the vegetable kingdom." If plants, they are so unlike all others that they must be regarded as belonging to a different genetic line. To set them off in a group by themselves would be merely an evasion of the question. Divesting one's self of prejudice and rightly esti-

FIG. 11.—*Fuligo septica*, reduced one-half.

imating the value of their resemblance to and their differences from plants, one is compelled to admit that their resemblances to any plants are merely superficial (e. g. to some puff-balls), while their differences are profound. On the

FIG. 12.—*Plasmodiophora brassicae*: I, cabbage-root, swollen, natural size; II, cells of affected cabbage, $\times 50$; III, spores, $\times 600$; IV, spores germinating; V, amoeboid masses.

other hand, in their structure, both in the vegetative and reproductive stages, they exhibit such striking similarity to the lower protozoans that one can not avoid the conclusion that their real relationship is with these lower animals rather than with plants. Among investigators who have placed the slime-moulds outside the vegetable kingdom are the following: de Bary (1858), Haeckel (1866), Allman (1879), Kent (1880), Zopf (1887), Rolleston and Jackson (1887), Bennett and Murray (1889), Lister (1890). On the other hand, those who have devoted themselves to a study of these organisms, systematically or descriptively, generally regard them as plants—e. g. Rostafinski (1875) probably, Cook (1877), Berlese (1888), Schroeter (1889), McBride (1892), Masee (1892).

Masee, *A Monograph of the Myxogastres* (1892). CHARLES E. BESSEY.

Sling: a simple contrivance for hurling missiles, consisting of a small disk of leather pierced by a hole and suspended by one, two, or three strings, say a yard long. A stone or other missile was placed upon the leathern disk, and then whirled rapidly about for a time, when one of the strings was dropped from the hand at the proper instant, and the missile sent with great force through the air. The ancient Greek light-armed troops in the Persian wars and afterward used the sling, often with a plummet of lead instead of a stone. These bullets are well known to antiquarians. They frequently bear the word *ΔΕΕΛ*—"Take this," or some similar word. The Persians, Achæans, Acarnanians, and especially the Balearic islanders, were famous slingers. The sling was also used by several half-savage peoples, as the Tahitians.

Sliv'no, or **Selim'nia** (Bulg. *Sliven*): town in Bulgaria (see map of Turkey, ref. 3-D); commanding on the S. the important pass in the Balkans called the Iron Gate; carries on an active trade in wool and arms. Pop. (1893) 23,210.

Stoane, Sir Hans (physician and naturalist); b. at Killybegh, County Down, Ireland, Apr. 15, 1699. He went to London in 1667 as physician to the Duke of Albemarle and after his return published a work on the natural history of the island in two vols. 1707-23. Subsequently he was appointed physician-general of the British army 1719, and physician to the King 1727. He was a prominent member of the Royal Society, succeeding Sir Isaac Newton as president in 1747; most of his numerous scientific publications were embodied in the *Philosophical Transactions* of that society. He was an indefatigable collector of objects of natural history, antiquities, coins, etc., and books, and being wealthy he was able to amass a large and very valuable museum. It in London June 14, 1792. In accordance with the terms of his will, his museum and library were sold to the government for £20,000—a price which was no more than what it was sold to the intrinsic value of the collection. This collection became the basis of the British Museum. H. H. S.

Stant, Jesse Drake, naval officer; b. in New York in 1789; entered the U. S. navy as a midshipman 1800; was engaged in the action between the United States and the Maestricht on Oct. 15, 1812; served in the expedition against West Indian pirates 1824-25; was commander of the Pacific squadron 1844-45; was next placed in charge of the Norfolk navy-yard; superintended the construction of the Stevens battery at Hoboken; became commodore (retired list) July 16, 1860, and rear-admiral in July, 1865. D. at New Brighton, Staten Island, N. Y., Nov. 28, 1867.

Stoane, Henry Wansan; soldier; b. at Pompey, Onondaga co., N. Y., Sept. 24, 1827; graduated at the U. S. Military Academy July 1, 1852; appointed second lieutenant of artillery; first lieutenant 1855. After a brief campaign in Florida against the Seminoles, he served in garrison at Fort Moultrie, South Carolina, until Oct. 31, 1859, when he resigned from the army to practice law at Syracuse, N. Y.; was a member of the New York State Legislature in 1859. On May 31, 1861, he was appointed colonel of the Twenty-seventh New York Volunteers, which regiment he led in the battle of Bull Run July 21. Early in August he was commissioned brigadier-general of volunteers; in September was assigned to command of a brigade in Franklin's division of the Army of the Potomac, and in the Virginia Peninsula campaign of 1862 was engaged in the siege of Yorktown and action of West Point, succeeding to command of the division May 15, on Franklin's assignment to the Sixth Corps. At the battle of Gaines's Mill, June 27, his command was sent to Porter's relief at a critical period, and rendered important service; at the battle of Glendale, June 30 it held the right of the main line, as at Malvern Hill July 1. He was made a major-general of volunteers July 4 and engaged in the second battle of Bull Run, at South Mountain, and at Antietam. In October he was assigned to the command of the Twelfth Corps, which he led at the battle of Chancellorsville and at Gettysburg, where he commanded the right wing of the army. Transferred, he served in the department of the Cumberland until Aug., 1864, when, his corps being consolidated with the Eleventh, he was assigned to the command of a division and of the district of Vicksburg. In Aug., 1864, he succeeded Gen. Hooker in command of the Twentieth Corps, which was the first to occupy Atlanta, Ga., Sept. 2. To Sherman's march to the sea he commanded the left grand division of that army. In Sept., 1865, he resigned, and resumed the practice of his profession in Brooklyn, N. Y., assuming in 1866 the appointment of colonel of infantry in the regular army. He was Democratic candidate for secretary of state of New York in 1865, but was defeated; was elected to the Forty-first, Forty-second, and Forty-eighth Congresses; president of board of public works, Brooklyn, N. Y., 1878-79. D. in Brooklyn, N. Y., April 14, 1894.

Stoe, the fruit of the blackthorn (*Prunus spinosa*), a small thorny plant native of Europe, sparingly naturalized in the southern parts of the U. S. The black stoe fruit is used for preserves, for making a luscious port wine, and for dyeing black. The marigold fruit yields German seed, a substitute for gun-cotton, and the wood is made into walking-sticks. Some botanists regard the stoe as the original fruit of the cultivated plum. There is a double-flowered form in cultivation. Revised by L. H. BAILEY.

Stoth (St. Eng. *stoth* < O. Eng. *stoth*, deriv. of *stith*, *stith*), any one of several species of the family *Bradyptidæ*, notable for sluggishness. The form somewhat recalls

that of the *Peromyscus* (mouse and musk-rat) in the freedom of the members from the constant abdominal integument, the length of the limbs, and especially of the fore ones, and the atrophy of the tail. The skull is oblong and compressed, with the rostral portion much abbreviated; the intermaxillary bones much extended, malar bones almost fused from the symphyseal processes of the maxillary bones, and each with a supratoral process; the lower jaw has a gutter-like symphysis; molar teeth 3, simple and rounded; canine moderate; posterior limb shorter than the anterior; toes in hindmost numbers two or three (fully developed) in front and three behind. The species differ considerably in other characters. All are confined to South and Central America. Numerous peculiar characters in addition to those

The stoth.

mentioned are exhibited by the skeleton, one of the most remarkable features being the number of cervical vertebrae. Almost without other exceptions the members form only mammals have seven cervical vertebrae, but in the stoths some (the *Bradyptidæ*) have as many as nine, while one (*Chelopus hoffmanni*) has only six, although its near relations (e. g. *Chelopus dufrenoyi*) have seven. The species are ill adapted for progression on the ground, the feet being bent inward, but are admirably fitted for life in trees. Unlike all other mammals, they cling to the branches by their feet with the back downward, and thus they progress, feed, and sleep. They rarely or never voluntarily descend to the ground, but when one tree is denuded of its leaves proceed from it to a contiguous one by means of interlocking or neighboring boughs. *Bradyptus* and *Arctophaga* belong to the sub-family *Bradyptidæ*, and *Chelopus* to the sub-family *Chelopidæ*. Revised by P. A. LACAR.

Slovak Language: See SLAVIC LANGUAGES.

Slovak Literature [*Slovak* is from Slav, *Slavak*; cf. SLAVONIA]; the body of literary productions in the language or dialect of the Slovaks, who, with the Moravians, belong to the Czech branch of the Slavic family. The Slovaks dwell in the mountainous northwest corner of Hungary, but extend beyond the Hungarian boundary into Moravia; besides, there are oases of Slovaks all through Hungary, hemmed in and intellectually as well as politically oppressed by the Magyars. According to the census of 1880, their number was 1,255,400, more than two-thirds professing the Roman Catholic faith, the rest belonging to the Augsburg Confession.

The Slovak dialect, which according to the consensus of the most eminent Slavists exhibits an earlier form of Czech, just as Slovene is older than Serbian-Croat, produced some weak specimens of literature in the Middle Ages; but the Reformation, introduced from Bohemia in the sixteenth century, interrupted a national literary development, and established Czech (in the narrow sense) as the literary language among the Slovaks. For nearly 300 years their own dialect was almost extinct; a considerable number of Slovak authors arose in the eighteenth century, but all of them employed the Czech language, as Malibow Bel (1684-1749), especially famous as historian of Hungary; Daniel Krizan (d. 1740); Stephen Laska (d. 1818), editor of the first Slovak newspaper; Georg Polkovsky, and others.

At the end of the eighteenth century Catholic writers originated a literature of their own in the revived Slovak dialect, as distinctly separated from the Czech language. (See CZECH LITERATURE.) Anton Bernolak especially was instrumental in the separation; he endeavored to settle definitely the Slovak language by his grammar, *Grammatika Slovenska* (Pressburg, 1799) (Germ. transl., Buda, 1817), and his *Lexicon Slovaco-Budavense-Latino-Germanico-Hungaricum* (8 parts, Buda, 1825-27).

The attempt to revive the old Slovak literary language

was strongly opposed by the Magyars and the Czechs alike, but Slovak literature nevertheless developed. Poets of repute were active: Holly wrote an epic on Svatopluk in twelve books in classical style and meter and a Cyrillo-Methodiad in six books. He died in 1849, just at the great outbreak of the Hungarian revolution against the house of Hapsburg. Ljudevit Štur (b. 1815; d. 1856), studied in Pressburg and Halle, wrote some German pamphlets against the Magyars as the oppressors of the Slovak people, and edited in 1845-48 the Slovak newspaper *Slovenské Noviny* with the literary supplement *Orol Tatranski*. The revolution drove him from Hungary, and he fled to Vienna, where he became one of the fiercest agitators against the Magyars, while his great countryman Kossuth, entirely Magyarized, led the Hungarian revolution against Austria. By his paper and personal influence Štur raised Slovak to the standard of the literary language of his people. He also wrote in Czech a critical work on the character of Slavic popular poetry (Prague, 1853), and left a manuscript in German *Das Slaventhum und die Welt der Zukunft*, the first great Slavophil work, translated by W. Lamanskij into Russian (Moscow, 1867).

A number of other poets have gained a good reputation in Slovak literature, which seems firmly established, even if the process of Magyarization should succeed in obliterating the nationality of the people.

The most important and influential modern educator, grammarian, and framer of the Slovak language is Martin Hattala, born in 1821, at Trstená, Hungary. Originally a Catholic priest, he wrote a *Grammatica linguae Slovenicae* (Schemnitz, 1840), which secured for him a call as Professor of Slavic Languages to Prague. His principal merit is the elaboration of the Slovak language in phonetics, form, syntax: *Phonology of the Old and New Czech and Slovak Languages* (Prague, 1854); *Comparative Grammar of the Czech and Slovak Languages* (Prague, 1857); *Antibarbarus of the Czech Language* (Brus jazyka českého, Prague, 1877); text-books for Slovak schools, etc. His polemical writings against Schleicher, and his defense of the genuineness of the Königinhof Manuscript (*Rukopis Kralodvorský*) are noteworthy. Besides him three men eminently contributed to the definite settlement of Slovak language and literature: J. Victorin, by his *Grammatik der slowakischen Sprache* (4th ed. by Loos, Budapest, 1876); J. Loos, by his *Wörterbuch der slowakischen, ungarischen und deutschen Sprache* (Budapest, 1871); and Šembera, by his excellent treatment of Czech-Slovak dialectology (*Základové dialektologie česko-slovenské*, Vienna, 1864).

The chief collections of Slovak popular poems are by Šufarik (2 vols., Pest, 1823-27); Kollar (2 vols., Buda, 1834-35; *Národné Zpíevanky*); and by the Slovak Matica (suppressed by the Magyars) *Sborník Slovenských národních piesní* (Collection of Slovak National Songs, 2 vols., 1870-74).

HERMANN SCHOENFELD.

Slove'nian Language: See SLAVIC LANGUAGES.

Slovenian Literature: the literature produced by that branch of the Slavic family which inhabits the southern portion of Carinthia and Styria, all Carniola (except the great German speech-island around Gottschee), Görz and Gradiska, a small part of Istria, the region around Radkersburg in Hungary and around Cividale in Italy—total population (1895), about 1,300,000.

This literature is most closely related to that of the Servo-Croats. It is written in a language the oldest form of which is held by some of the greatest and most authoritative scholars—Kopitar, Miklosich, Daničić and Jagić—to be the mother language of Paleo-Slavonic, as preserved to us. Great zeal has been exhibited in fixing the grammatical structure of the language. This labor has been performed by scholars like Kopitar, Metelko, Murko, Janežič, Lewstik, and, best of all, Suman (*Slovenska slovnica*, Klagenfurth, 1884).

The only literary monument of Old Slovenian is the liturgical manuscript of Freising (Bavaria). It is in Latin script, and belongs to the tenth century (ed. by Kopitar in *Glagolita Klotianus*, Vienna, 1836). Then, until the middle of the sixteenth century, there was nothing that can be classed as literature. With the Reformation literary interest revived. The Carinthian reformer Primus Truber (1508-86) and his associates translated the New Testament into Slovenian in 1557. The first complete edition of the Bible on the Protestant side appeared first in 1584 in Tübingen. Other spiritual and church books, too, were composed by Truber,

but he was driven into exile, and the incipient reformatory movement suppressed by the counter-reformation. Literary activity again practically ceased until the end of the eighteenth century. Only meager grammatical and bibliographical work was produced. The first Slovenian grammar appeared in 1584, the first dictionary in 1592.

Toward the end of the eighteenth century, however, self-consciousness began to awaken among the Slovenes, as well as in the entire South Slavonic world, stimulated especially by the longing for liberty and by the Roman Catholic Church. On the Catholic side a complete Bible translation, pre-eminently by Japel and Kumerdey, was issued 1791-1802. Secular literature, too, began to flourish; Valentin Vodnik (1758-1819) was its founder. When Carinthia was incorporated into the Illyrian provinces by Napoleon and belonged to France (1810-14), he published his *Ilirja oživila* (Illyria revived), which cost him his position as inspector of schools when Austria regained her provinces. He also wrote valuable poems (*Pesni*, 3d ed. Laibach, 1869), and edited the first Slovenian newspaper (1797-1800). The greatest modern Slovenian poet, however, is Francis Prešern (1800-49); his poems are mostly lyrics (complete edition, *Pesmi Franceta Prešerna*, Laibach, 1866; German trans. by Samhaber, *Prešernklänge*, Laibach, 1890).

Since the middle of the nineteenth century national life has steadily developed, and the political revival has been accompanied by an increase of literary productions of a varied character. Levstik, Valjavec, and Stritar are very good national poets. The Matica Slovenska (Slovenian Literary Society) is the center of the literary movement. The periodical *Ljubljanski Zvon* (The Laibach Bell) is the great organ in which the national productions mostly appear.

The principal collections of Slovene folk-song are *Slovenske pesmi krajnskago naroda* (5 vols., Laibach, 1839-44); *Narodne pesmi ilirske* (Styria, Carinthia, West Hungary), by Stanko Vrac (Agram, 1839); *Volkslieder aus Krain*, trans. by A. Grün (Count Auersperg), Leipzig, 1850; *Četleje slovenskega naroda*, by A. Janežič (Klagenfurth, 1852). See Child, *Ballads*.

BIBLIOGRAPHY.—Kleinmayr gives an excellent sketch of Slovene literature, *Zgodovina slovenskega slovstva* (Klagenfurth, 1881); see also Pypin and Spasovič, *Istorija slavonskich literatur* (St. Petersburg, 1865; German by Tr. Fsch., Leipzig, 1880-84).

HERMANN SCHOENFELD.

Slows: See MILK-SICKNESS.

Sloyd: See MANUAL TRAINING.

Slug [from M. Eng. *slugge*, slothful; cf. Eng. *slack*, *slouch*, and *sluggard*]: any one of various naked terrestrial molluscs, mostly members of the family *Limacidae* (see PUL-

The red slug.

MONATA). The name is sometimes applied to other molluscs, and occasionally, but wrongly, to certain insects which occur as pests in gardens and greenhouses.

Slug-worms, popularly but incorrectly called **Slugs**: the larvæ of certain of the saw-flies (*Tenthredinidae*), belonging to the *Hymenoptera*. They are slug-like in form. In the U. S. the pear, rose, vine, raspberry, walnut, linden, and other trees are infested with the larvæ of species of *Salix-dria*, which are often very destructive. Decoctions of tobacco or quassia, whale-oil soap, a weak solution of carbolic acid, and petroleum are among the substances recommended for showering shrubs and trees infested with slug-worms. For small trees and shrubs hand-picking will generally prove sufficient.

Smalcald: See SCHMALKALDEN.

Small, JOHN: soldier; b. at Strathardle, Scotland, in 1726; served in the Scotch brigade, in the Dutch service, in the pursuit of the Jacobites of Scotland 1747, at Ticonderoga 1758, at Montreal 1760, and in the West Indies 1762; was in the battle of Bunker Hill; raised a corps of Highlanders in Nova Scotia, the Eighty-fourth Battalion, known as the "Royal Emigrants," which he commanded as major in the campaigns of New Jersey and Pennsylvania; became lieutenant-colonel 1780, lieutenant-governor of Guernsey 1783, and major-general 1794. D. at Guernsey, Mar. 17, 1796.

Small-arms: the projectile arm which since the invention of gunpowder has replaced the bow and arrow and musket. The original firearms, bombardards, were not portable, and it was not until the early part of the fifteenth century that lighter pieces came into use; even these, at first, required for their transportation and service several men, and were fired in the field from a tripod and from the fortress walls on a rest. Of such guns the Italian Orlando was reported to possess 4,000 in 1411; three years later they were employed at the siege of Avras, and in 1471 a number were transported into England by some Flemings that accompanied Edward IV. on his return from Flanders in that year. These hand-cannon, as they were called, could be carried by two men, had a straight stock of wood about a foot long, and were fired by a match applied on top of the breast.

The first improvement was the removal of the rest to one side and the addition of a pan to hold the priming; a sight at the breech was also added. The trigger of the cross-bow suggested to the English a similar arrangement for bringing the lighted match to the priming; the gun, after this modification, was called a matchlock.

In 1542 and again successive improvements received the names of snapnetter, snapnetter, and musquet; the stock was made curved, permitting aim to be taken from the shoulder instead of lying from the chest as formerly, and the weight was reduced to about 15 lb. The former tripod had now been replaced by a forked rest which the soldier carried as a cane. Green, in his *Military Antiquities*, describing the English musket, says: "He had besides the musketry weapon itself his course powder for loading, in a flask; his fine powder for priming, in a touch-box; his bullets in a leathern bag, with strings to draw to get at them; whilst in his hand were his musket-rest and his burning match, and when he had discharged his piece he had to draw his sword in order to defend himself."

In the Spanish army the musquetiers were a breed apart; the musket was a broad belt across the breast to which wood cases containing the proper charge of powder were attached; also a ball-pouch and a priming-flask. Six yards of slow-match for firing was wound about the stock. At the battle of Pavia the Spanish had a force of 2,000 arquebusers and 900 musquetiers, whose fire proved decisive in determining the issue of the battle, the balls readily penetrating the breast plates of the knights.

In the wheel-lock, snapnetter, flintlock, and finally the clicklock, names each marking an advance in design or construction, the match was replaced by some arrangement of flint and steel; the last-named piece was adopted by France in 1622, an example followed by all other nations within twenty years. In the flintlock the weight was brought down nearly to that of the modern rifle; in other respects too it marked the top wave of progress, and without material improvement remained during 150 years the arm of the infantry soldier, until early in the nineteenth century the invention of the percussion-cap, made of practical value about 1820, led to the gradual substitution in the next two decades of the percussion-musket.

Up to this date military small-arms were smooth-bored, and fired spherical balls between one-half and nearly three-fourths of an inch in diameter, and while the rifling principle had been known and used for many years it was not introduced for soldiers until early in the nineteenth century; to these rifles was then applied the percussion-cap. The breech-loading principle was also made a partial success for military arms at the same time, and some few soldiers were armed with them. In Prussia, where the needle-gun had been adopted, the boom began in 1841. Used with great success in the war with Austria in 1866, its merits were generally acknowledged, and in a few years different breech-loaders replaced in every country the muzzle-loading rifle, the change being induced not merely by the qualities of the

arms themselves, but in consequence of the introduction of the metallic cartridge, which, combining the cap, powder, and bullet in one receptacle, also served as a gas-check and prevented leakage at the breach, the main defect, at first of the new gun.

FIG. 1.—Hall's breech-loading musket, patented 1811.

In 1810 the first successful breech-loader was invented by Hall in 1811. Two years later he proposed its manufacture on the principle, which had previously failed in France, of interchangeable parts; and in 1817, a board of officers reporting favorably, he was employed to superintend at the U. S. arsenal, Harper's Ferry, the establishment of the necessary machinery and the manufacture of the gun. The system of interchangeable parts has since prevailed in the U. S. and has been adopted in Europe, but the arm itself met with only a qualified success. Part of the cavalry was armed with the carbines, but upon the death of the inventor in 1844 their manufacture was discontinued.

In 1854 Congress made an appropriation for breech-loading rifles and a board of officers recommended those of Sharps and Symmes for trial. Three years later another board reported in favor of the Burnside rifle, an opinion confirmed by a third board in the following year, but without recommending the adoption of the arm for service.

The civil war caused a suspension of experiments, all the energies of the ordnance department being then given to the production in sufficient quantities of the arms then in

FIG. 4.—Rossian flintlock.

FIG. 5.—Martini Henry (British).

FIG. 6.—Mauser (German).

use. From Government and private factories and from abroad nearly 4,000,000 small-arms were obtained, including nineteen varieties of breech-loading carbines and eight of rifles, those of Burnside, Sharps, Maynard, and Henry (the latter a magazine-arm) being the best known.

After the war, boards of officers were convened in 1865,

1869, and 1872; they mentioned favorably the Peabody, Remington, Sharps, and Springfield, and finally recommended the adoption of the latter arm.

The same decade witnessed the adoption abroad of arms that remained for nearly twenty years in the hands of troops, and which, while differing in many particulars, can be placed in two general classes dependent upon the method of breech-closure—viz., by a hinged block and by a sliding bolt. Of the first class the Remington, the Springfield of the U. S., and the Martini-Henry of Great Britain, and of the second class the Mauser of Germany and Berdan of Russia, are the best known. As these, with those of other countries, marked the highest development of the single-loading rifled breech-loader, their principal features are given in the accompanying table.

TABLE I.—SMALL-ARMS OF DIFFERENT NATIONS, 1874.

NATION.	Name of gun.	When adopted.	Caliber, inch.	WEIGHT OF—					Initial velocity, foot-second.
				Gun, pounds.	Bullet, grains.	Powder, grains.	100 cartridges, pounds.		
Austria	Werndl	1874	0.421	9.88	386	77	7.83	1,410	
Belgium	Albini	1867	0.433	9.85	386	77	9.06	1,367	
Denmark	Remington	1870	0.450	9.08	386	60	8.75	1,300	
France	Gras	1874	0.433	9.25	386	81	9.52	1,465	
Germany	Mauser	1871	0.433	9.76	386	77	9.25	1,410	
Great Britain	Martini-Henry	1871	0.450	8.75	480	85	11.07	1,362	
Holland	Beaumont	1871	0.433	9.59	386	66	8.57	1,328	
Italy	Vetterli	1870	0.410	9.04	316	61	7.50	1,445	
Russia	Berdan	1871	0.421	9.23	370	78	8.62	1,400	
Sweden	Remington	1867	0.473	9.35	370	66	7.68	1,312	
Switzerland	Vetterli	1874	0.410	10.34	316	56	6.75	1,425	
Turkey	Peabody	1874	0.450	8.50	480	85	11.07	1,360	
United States	Springfield	1873	0.450	8.68	405	70	8.75	1,350	

Since 1885 there has been a great improvement in small-arms, the most important being the substitution of magazine-arms for the single-loaders (see MAGAZINE-GUNS), the decrease in the caliber of the barrel, and the adoption of smokeless powder in place of the powder formerly used.

As magazine systems were gradually developed the necessity of meeting the increased expenditure of ammunition with an augmented supply of cartridges became evident, but as the soldier's load was already at the limit considered practicable, this could only be accomplished by diminishing the weight of a single round, and that only by decreasing the diameter of the bullet and consequently of the bore of the rifle. This has resulted in the adoption in different countries of calibers between 0.315 and 0.256 inch, a decrease that probably has not yet reached its limit.

When gunpowder was used in these small bores, the fouling soon became excessive, unduly impairing the accuracy of fire. To overcome this trials were made which have led to the introduction of the so-called SMOKELESS POWDERS (*q. v.*). Many of these powders have been successfully developed and are in general use; their range of chamber-pressure varies from 14 or 15 tons per square inch, as with the powders used in the French Berthier and the Schmidt, to 20 tons in the Belgian Mauser and 21 tons in the German infantry rifle. This necessitates a strength and stiffness in the breech-mechanism of the new rifles that the old arms did not require, and also a corresponding increase of strength in the barrel. The modern barrels are therefore generally made of a superior grade of steel and of a little greater thickness of metal. Being of less interior diameter and also somewhat shorter, their weight, as compared with the old, has been diminished. With the augmented pressure also comes a great gain in the initial velocity, necessitating, in order to secure steadiness of flight for the bullet, a more rapid twist to the rifling, which now makes in all the new guns one turn in about 8 or 10 inches, instead of 18 to 24 inches as formerly. The majority of the barrels are rifled with four grooves (though some have only three and others six or seven), of a depth varying in the different countries from 0.003 to 0.006 inch, and more frequently of a width two or three times that of the lands.

As leaden bullets fired with high velocities through such barrels will not follow the rifling, but will strip and override the lands, it became necessary that the surface of the projectile be made of some harder metal; but to retain the high specific gravity of the lead, with the consequent ability of the ball better to overcome the resistance of the air, the greater portion of the bullet is made of a lead slug and then coated or jacketed with a covering, about 0.02 inch thick, of some harder metal, as steel, copper, nickel, or Ger-

man silver. These bullets have a length of about four calibers, are without the cannelures or lubricant of the lead ball, and weigh on the average about 220 grains.

The weights of the smokeless powder-charges vary with the particular powder, averaging about 30 to 40 grains.

The penetration of the bullet at all distances has been increased by the alteration in its shape, by its harder surface, and also, except at the extreme ranges where the air-resistance has overcome much of the velocity, by its more rapid initial movement. At the shorter ranges, 200 to 300 yards, protection is now obtained by about 0.2 inch of steel plate and about 0.3 inch of wrought iron. The penetration into earth at these distances is about 25 inches, into pine about 30 inches. As they have not been used to any extent in warfare their effect upon the living human body is yet to be fully determined; probably if striking no bone the bullets will inflict wounds on three or four men in file, but wounds less serious than those from the heavier lead ball.

With the greater number of the modern guns and powders the velocities are about 2,000 feet per second, running up for the smaller calibers, as the new guns of Italy, Holland, Roumania, and Norway, to about 2,300 feet per second. This gives a dangerous space in front of the muzzle of fully 600 yards, a maximum even exceeded by the extremely reduced calibers just mentioned, and a flatness of trajectory at all ranges compensating for errors when estimating the distance of the objective that would produce a miss with the old weapons.

The recoil is less than half that of the old single-loader.

The sights on all modern military arms are designed primarily for use in battle, rather than on the target-range; they are strong and simple in construction, with an open leaf that allows an unobstructed view when aiming, and generally without any arrangement giving drift or windage correction. The lowest adjustment is 300 meters (or yards), the leaf for that range being turned down on the base. Above that, on the leaf, the graduations are placed only for 100-meter (or yards) intervals, and with many of the sights it is impossible to obtain any closer adjustments than given by these limits, the slide engaging in notches that occur only at the graduation-marks. These latter generally extend up to 1,800 or 2,200 yards.

For the familiar triangular bayonet all nations except Russia have substituted knives with blades from 9 to 12 inches long and about an inch wide. The guards are short and usually straight, the handles of wood and steel, and about 4 inches long. The weights of the complete bayonets are from 8 to 15 oz.

The heat produced by discharge is much in excess of that formerly evolved; the barrels can not be freely handled after ten or twenty shots have been quickly delivered. To overcome this difficulty, the Germans have enveloped the barrel in a metallic case, and the Swiss have covered it with wood until it appears entirely surrounded by the forestock, but most of the other countries have limited the wooden hand-guard to the space back of the rear sight or else extended it only as far forward as the lower band. The latter provision is probably the best, affording all the protection required when firing or when carrying the piece afterward.

The breech-block of the single-loader has been replaced by a bolt having a sliding and generally also a turning movement. When closed it sustains the shock of discharge; moving it extracts the empty cartridge-case and recocks the piece for firing. In all countries these arms are also magazine-guns, that for the U. S., Fig. 8, having been chosen.

FIG. 8.—U. S. magazine rifle, model 1892.

the autumn of 1892. This arm was selected only after examination lasting nearly two years, careful consideration being given not only to the rifles used by the troops of Austria, Belgium, Denmark, Great Britain, France, Germany, Japan, Portugal, Roumania, Russia, and Switzerland, but also to those presented by the leading gun-inventors of the U. S. and Europe. The rifle finally chosen was the invention of Capt. O. Krag, director of the royal small-arms factory at Kongsberg, Norway, and E. Jørgensen, an armorer there employed.

The accompanying table gives the rifles and their ammunition forming (1895) the infantry armament of various countries.

it appear in the form of an epidemic. The treatment of smallpox is principally what is called symptomatic, that is, addressed to the individual conditions incident to the disease. Violent medication has been entirely abandoned. The patient is isolated, given digestible food, plenty of water, and cool and antiseptic applications are made to the skin.

CHARLES W. DULLES.

Smallwood, WILLIAM: soldier; b. in Kent co., Md., about 1732; raised a battalion of Marylanders 1776, which he commanded as colonel, and half of which perished in the battle of Long Island under another commander; was engaged in the battle of White Plains; was appointed brigadier-general Oct. 23, 1776; accompanied Gen. Sullivan in the Staten Island expedition 1777; raised a new battalion of militiamen from the Western Shore of Maryland, and led it at the battle of Germantown; was made major-general Sept. 15, 1780; was with Gates in his Southern campaign, but left after the defeat at Camden, refusing to serve under Steuben; was member of Congress 1785, and Governor of Maryland 1785-88. D. in Maryland, Feb. 14, 1792.

Smalt: See COBALT.

Smart, BENJAMIN HUMPHREY: grammarian and metaphysician; b. in England about 1785; was for more than fifty years from 1815 a successful teacher of elocution in London; was a voluminous writer upon grammar, logic, rhetoric, and metaphysics, in which last department he claimed to "assert, correct, and carry onward the philosophy of Locke." Among his works were *A Grammar of English Pronunciation* (1810); *Rudiments of English Grammar Elucidated* (1811); *A Grammar of English Sounds* (1813); *Practical Logic* (1829); *Accidence of Grammar, Principles of Grammar, Manual of Rhetoric and Logic, The Practice of Elocution, and Historico-Shakspearian Readings*, the five latter being issued as a complete series in 1858; *Outlines of Sematology* (1831), with a *Sequel* (1837) and an *Appendix* (1839), the three works being issued together as *The Beginnings of a New School of Metaphysics* (1839); *The Way out of Metaphysics* (1844); *The Metaphysicians, a Memoir of Franz Carvel, Brushmaker, and of Harold Fremdling, Esq.* (1857); *Thought and Language* (1855); and *An Introduction to Grammar on its True Basis* (1858). Smart also published in 1836 a *Pronouncing Dictionary*, based upon that of John Walker, issued an epitomized edition of the same in 1840, and an *Appendix* in 1846 (revised editions 1860), which figure among the authorities upon pronunciation most frequently cited in the later editions of Webster's and Worcester's dictionaries. D. about 1872.

Revised by B. I. WHEELER.

Smart, CHRISTOPHER: poet; b. at Shipbourne, Kent, England, Apr. 11, 1722; educated at Pembroke College, Cambridge, where he became a fellow 1745; settled in London as a writer, becoming intimate with Pope, Johnson, and Garrick; was noted for improvidence and a convivial disposition, which made him the inmate of an insane asylum and later of the king's bench prison for debtors, where he died May 18, 1770 or 1771. He translated the *Works of Horace* into English prose (2 vols., 1756), and into verse (1767); published *The Hilliad, an Epic Poem* (1753), being a satire on Sir John Hill, noted for his quarrels with Fielding and with the Royal Society, and *The Parables of Christ done into Verse* (1765); but his most remarkable production was the *Song to David*, written in a madhouse, published in 1763, and reprinted in full in Chambers's *Cyclopædia of English Literature*. See *With Christopher Smart, in Browning's Parleyings with Certain People of Importance*.

Revised by H. A. BEERS.

Smart, HENRY: organist and composer; b. in London, Oct. 26, 1813; after studying law took up music; in 1831 was organist of the parish church of Blackburn, and there composed his first important work, an anthem. In 1836 went to London, where he remained, playing, teaching, and composing. His works include an opera, *Bertha* (1855); cantatas, *The Bride of Dunkerron*, Birmingham festival, 1864; *King René's Daughter* (1871), *The Fisher Maidens*, both for female voices; and an oratorio, *Jacob*, Glasgow festival, 1873. D. July 6, 1879.

D. E. HERVEY.

Smeaton, JOHN: civil engineer; b. at Aunthorp, near Leeds, England, May 28, 1724; invented in 1751 an instrument for measuring a ship's progress; made several valuable inventions in hydraulic machinery, for which he received the Copley medal (1759); was noted as the builder of the Eddystone lighthouse (1756-59), an account of the con-

struction of which he published (1791); constructed Ramsgate harbor (1749-74), the Forth and Clyde Canal, the Greenwich and Deptford water-works, and many other important improvements. D. at Aunthorp, Oct. 28, 1792.

Smeety'm'nuus: a name compounded of the initials of the authors of a celebrated tract entitled *An Answer* (1641), written in reply to Bishop Hall's *Episcopacy by Divine Right Asserted* (1641). The names of its five writers are Stephen Marshall, Edmund Calamy, Thomas Young, Matthew Newcomen, and William Spurstowe.

Smell, Organ of: See HISTOLOGY (*Organs of Special Sense*).

Smelt [in allusion to the cucumber-like odor of the typical species]: a small salmoniform fish belonging to the genus *Osmerus*, or a related genus, of the family *Argentinidae*, and esteemed as food. These fishes have the teeth of the lower jaw stronger than those of the upper, and fang-like ones on the vomer and front of the tongue, and normally inhabit salt water. *Osmerus eperlanus* is the European species; *O. mordax*, the eastern North American, known also as frost-fish; *O. thaleichthys*, the California smelt. *Hypomesus pretiosus* is the surf-smelt of California and northward. The silver-sides (*Atherinidae*), structurally very unlike the *Argentinidae*, are also loosely called smelts, as the California *Atherinopsis californiensis*. Among other fishes locally and improperly known by the name are the cyprinoid *Ilybognathus regius*, the spawn-eater, and the Pacific tomcod.

Smelting [from M. Dutch *smelten*: O. H. Germ. *smelten* (> Mod. Germ. *schmelzen*), melt; cf. Gr. *μείδω*, melt, but probably not akin to Eng. *melt*]: in the more extended use of the term the entire process of reducing metals from their ores by fusion; in a more limited sense those particular metallurgical processes in which an ore or a product of other operations, such as roasting, treatment with acids, etc., is finally reduced to pure metal or some intermediate product. The fusions are conducted in shaft-furnaces, reverberatory furnaces, or crucibles. Metals ready for use or sale may be produced from ores by a single smelting operation, as iron; or they may require a series of smeltings, alternated with roastings, as copper when made from sulphuretted ores. The smelting process may be simply reducing, or oxidizing and reducing, or may be designed to volatilize certain bodies, to oxidize others, and to reduce still others. (Charcoal, coke, and anthracite are the fuels generally used in shaft-furnaces and for heating crucibles, and bituminous coal and wood for reverberatory furnaces; but peat, gas obtained from different materials in special generators and peculiarly constructed fireplaces, natural gas, petroleum, and waste gases from furnaces are used.)

To remove earthy matters and foreign oxides, and to facilitate the collection of the reduced metals, slags are produced, and, according to the nature of the effect to be obtained and the substance to be removed by scorification, the charges are so constituted as to yield more or less acid or basic slags by judicious mixture of the ores treated or by addition of various fluxes. Sometimes it is desirable to liberate some sulphur to combine with the metals and form a *matte* or *regulus*, and then iron pyrites is added. The general products of smelting are slag and metal, or slag and *matte*, or sometimes all three at once. The slags may have to be subjected to a reducing smelting to obtain the metal retained in them, the metal to an oxidizing and scorifying smelting to purify it, and the *matte* to Bessemerizing, to an oxidizing smelting, or, after roasting, to a reducing and scorifying smelting, during which some metals are partly removed by volatilization, as antimony, arsenic, and zinc; others by oxidation and scorification, as iron, zinc, and tin, while the desired metal is obtained in a nearly pure state or as a concentrated *matte*.

Shaft-furnaces are mainly employed for reducing fusions with coke, charcoal, and anthracite, although by a proper construction, good management of fluxes, and preparation of the ores, etc., a partial oxidizing action can be produced. The fusion is almost invariably effected by the aid of a blast. Reverberatory furnaces, with wood, coal, natural or producer gas, or petroleum, are generally used for oxidation; a very effective reducing action can also be obtained in them by excluding the air and keeping the hearth full of reducing gases. In crucibles the results of smelting depend entirely on the nature of the charge, oxidation and scorification being produced by certain fluxes; reduction by adding carbonaceous matters; scorification alone by using a simple

like like form; precipitation by adding metallic iron or some substance which will yield iron by reduction; and preservation by adding metallic sulphides, or alkaline sulphates with a reducing agent and a simple flux.

Revised by V. Kyrleberg.

SMITH, SIR GEORGE (1800-1891): brother of James, who, because of the strength of Smoother, was then back to him from Egypt. Shortly afterward Canby, having learned that Smoother was seated on the royal throne, sent him back to death secretly. A rebellion broke out in some because of the tyranny of Canby, who was still seated in Egypt, and the brother of the governor of the royal palace, because he resembled much the dead Smoother, was declared to be the real monarch, and proclaimed king. In 1891 Canby began his journey home to defend his throne, but he died on the way, and though the rebellion soon discovered the fraud that had been practiced on them, still the false Smoother was able to hold the throne for seven months. He was finally murdered by the nobles, who elected Charles (the) king.

J. R. S. Smith.

SMITH, PETER JOHN, D.D.: missionary; b. at Toronto, Ontario, Dec. 11, 1801; was trained in the seminary at Hamilton; sailed with five fellow students to the U. S. in 1827; became a Jesuit; assisted in founding the University of St. Louis, Mo., 1829; in 1838 was sent to labor with the Pawnee Indians, on sugar creek, and in 1840 was transferred to the Flathead mission, in the Rocky Mountains. Father Smith acquired a singular power of constraint over most all the Indian tribes, from the Sioux westward. He became procurator of the Indian missions, several times visited Europe in behalf of his missions, and wrote several works in French and English, among them *Letters and Sketches, and Residence in the Rocky Mountains* (Philadelphia, 1847); *Oregon Mission and Travels over the Rocky Mountains in 1845-46* (New York, 1847); *Western Missions and Missions in the Rocky Mountains* (1852); and many letters published in the *Annals of the Roman Propaganda*. He was a chaplain in the Utah expedition. D. in St. Louis, May 24, 1872.

Revised by S. M. Jackson.

SMITH: a mosswort, *Megacarpus albertus*, inhabiting the northern parts of the Old World. It is distinguished by the short narrow bill (considerably shorter than the head), whose margins are beset with short approximated lamellae. In the male the ground color is white (whence runs of the popular name, white moss); black pericarp around and in front of the eyes at the summit under the crest, at the front of the back, on the tail, and on the wings, but the scapulars and middle wing coverts, as well as secondaries and tertials, are white; in the female the head is of a reddish brown; the length is about 17 inches. Like its relatives, it is an excellent swimmer and diver. It makes a nest near the water, and lays between eight to ten eggs. T. G.

SMITH (= Lat. = Gr. *smith*, yew, also (with distinguishing adjectives) a kind of bean, a kind of birdseed): a large genus of monocotyledonous plants of the sub-family *Smithaceae* and family *Liliaceae*. They consist of herbaceous or woody plants, generally more or less climbing, with rotund leaves and bisexual or polygamous flowers, a six-petaled perianth, six stamens, a free three-celled ovary, with one or several seeds in each cell, three stigmas, and a round berry. There are about 200 known species scattered over the globe, though most numerous in the temperate and tropical parts of Asia and America. True *Smithaceae* and China root are among the products of the genus, the former from *S. officinale*, *S. peripetua*, and *S. aphylla*, of the West Indies and South America, and the latter from *S. China* of Japan, China, and the East Indies. The U. S. has numerous species, none of them important. The so-called China root is the most widely known of them. It is very frequent in the southern parts of the U. S., and extends northward to New Jersey. It has large, tuberos, brownish-red root-stocks, which contain a considerable amount of starch. Formerly the Smothers and the root-stocks for food in times of scarcity, either separating the starch or cooking the whole root. At present a kind of beer is made from them with molasses, yeast, and hops, and sometimes. Several plants of this genus are used in horticulture and garden culture. The related climbing plant, which under the name of *smith* is cultivated by the Chinese in the *Myrsiphyllum asperifolium*. It comes from the highlands of Great Hope, and is more closely allied to the yew. It has a fine thread-like stem, sometimes 20 feet long, and glaucous, strongly colored leaves which do not easily fall.

Revised by CHARLES E. BROWN.

SMITH, SAMUEL: author; b. at Haddington, Scotland, in 1812; educated for the medical profession; practiced some years as a surgeon at Leeds; became editor of the *Leeds Times*; was secretary to the Leeds and Thirsk Railway 1845-52, and to the Southwestern Railway 1853-55. Among his numerous works are *Self-Help, with Illustrations of Character and Conduct* (1840); *Workmen's Savings, Strides, and Struggles* (1841); *Lines of the Englishmen, with an Account of their Principal Works* (4 vols., 1851-55); *Character* (1871); *Perils* (1875); *The Huguenots in England and Ireland* (1876); *The Huguenots in France after the Revocation of the Edict of Nantes* (1874); *Life of a Scotch Naturalist* (1879); *George Moore, Merchant and Philanthropist* (1879); *Life of Robert Dick, Theologian and Botanist* (1879); *Italy, with Illustrations of Character, Politics, and Industries* (1880); *Men of Invention and Industry* (1884); *A Publisher and his Friends: John Murray* (1891); *James, the Barker just* (1891); *Isiah Wedgwood* (1892). Most of his works have been republished in the U. S.

SMITH, GEORGE HERVEY: landscape-painter; son of James Smith (1807-85), engraver; b. in New York, Dec. 26, 1840; pupil of James M. Hart; National Academian 1882; member of the American Water-color Society. Studies in New York. His brother, James Davis, also a landscape-painter, was born in New York, Jan. 10, 1833; studied under his father; became a National Academian 1876; member American Water-color Society. Studies in New York.

W. A. G.

SMIRKE, ROBERT, R. A.: painter; b. at Wigan, near Carlisle, England, in 1753; was brought up in the business of a painter of coach-paints; was admitted as a student at the Royal Academy 1771; became an associate 1791; his presentation picture being *Don Quixote and Sancho Panza*; painted many scenes illustrating the Bible, Milton, Thomson, and *The Arabian Nights*; was one of the contributors to Bayly's *Shakespeare*, and brought out a magnificent edition of his daughter Mary's translation of *Don Quixote*, with 74 engravings (4 vols., London, 1815). D. in London, Jan. 5, 1845.

SMIRKE, SIR ROBERT, R. A.: architect; eldest son of Robert Smirke; b. in London, England, in 1790; educated as an architect in England and on the Continent; was gold medalist at the Royal Academy 1799; published *Specimens of Continental Architecture* (1806); was architect of the new Court Garden Theater 1805-09, of the mint 1813, the post-office 1823-29, the Union, United Service, and Carillon clubs, most of them being examples of the so-called classical school, and built many other important private and public edifices. His latest rests chiefly upon the British Museum, built by him at intervals from 1825 to 1847. He was knighted 1851, and was thirty years treasurer of the Royal Academy. D. at Cheltenham, Apr. 15, 1867.

SMIRKE, SYDNEY, R. A.: architect; son of Robert Smirke; b. in England, 1799; studied architecture; gained the gold medal of the Royal Academy 1819; assisted his brother in designing the Oxford and Cambridge University Club-house in Pall Mall, London, 1815-17; superintended the restoration of the Temple church, of which he published an account (1842); in 1847 succeeded his brother as architect to the British Museum, in which capacity he built the reading-room 1855, the Russian, Assyrian, and other galleries, and was the architect of several other public edifices and of many splendid country-seats. His last achievement was the new Royal Academy in Burlington House, begun 1867 and completed 1874. He was chosen R. A. 1869; became Professor of Architecture at the Academy 1861, and its treasurer 1862; subsequently trustee of that institution and of the Science Museum. D. Dec. 11, 1877.

SMITH, ADAM: economist and philosopher; b. at Kirkcaldy, Fifeshire, Scotland, June 5, 1723. His education was carried forward in the grammar school of Kirkcaldy, the University of Glasgow, and Balliol College, Oxford, with a view to his taking orders in the English Church. In Glasgow he gave chief attention to mathematics and natural science, but at Oxford he turned to the study of languages, and took special pains to master English. Abandoning all thought of the clerical office, he returned to his native place, and in 1746 took up his residence in Edinburgh. There he first came before the public, delivering lectures on rhetoric and belles-lettres under the patronage of Lord Kames. In 1751 he was made Professor of Logic in the University of Glasgow, and the following year became Professor of Moral

Philosophy in the same institution. He resolved the science of morals into four parts, and accordingly discussed in his lectures, first, natural theology; second, ethics; third, justice with reference to specific rules and precepts; and fourth, political expediency as affecting the honor, power, and prosperity of the state. His lectures were delivered extemporaneously, and were, for both matter and style, very popular. His first published work was the *Theory of Moral Sentiments*, issued in 1759. It called forth a high encomium from Hume, and brought Smith at once a wide reputation. Incidentally, this publication led to his being selected, four years afterward, to accompany the young Duke of Buccleugh on his travels. He carefully improved the opportunity thus presented to become acquainted with the internal policy of other states, and to confer with distinguished economists on the Continent. He returned to England in 1766, and for ten years lived with his mother in partial retirement at Kirkcaldy. There he devoted himself to the earnest study of subjects which had occupied his attention for nearly twenty years. The result was given to the world in 1776 in his great work entitled *An Inquiry into the Nature and Sources of the Wealth of Nations*. Many principles laid down in that work were no doubt derived from the French economists, but the completeness of their compilation and the clearness with which they are set forth in this treatise fairly entitle Adam Smith to be regarded as the father of modern political economy. His book will continue to be, as it has been hitherto, a standard of reference. Smith's biographer thus defines the main feature of this work: "Its great object is to demonstrate that the most effectual plan for advancing a people to greatness is to maintain that order of things which nature has pointed out, by allowing every man, as long as he observes the rules of justice, to pursue his own interest in his own way, and to bring both his industry and his capital into the freest competition with those of his fellow citizens." After residing two years in London, he was appointed a commissioner of customs for Scotland, and removed to Edinburgh, where he spent the remainder of his life. In 1787 he was elected lord rector of the University of Glasgow. D. in Edinburgh, July 17, 1790. After his decease most of his manuscripts were destroyed, as he had directed, but a few were published in 1795 under the title *Essays on Philosophical Subjects*.
Revised by J. MARK BALDWIN.

Smith, ALEXANDER: poet; b. at Kilmarnock, Scotland, Dec. 31, 1830; was pattern-designer for a lace-factory at Glasgow; published a volume of poems, *A Life Drama* (1853), which attracted great attention; was appointed secretary of the University of Edinburgh 1854; wrote *Sonnets of the War*, along with Sydney Dobell (1855); *City Poems* (1857); *Edwin of Deira* (1861); *Dreamthorp* (1863); and the prose works *A Summer in Skye* (1865); *Alfred Hagart's Household* (1866); and *Miss Oona McQuarrie* (1866). D. at Wardie, near Edinburgh, Jan. 5, 1867. Smith has been classed with Bailey, the author of *Festus*, and others of "the spasmodic school" satirized in Aytoun's *Firmilian*. A *Memoir* by P. P. Alexander was published along with a posthumous volume of miscellanies entitled *Last Leaves* (1868).
Revised by H. A. BEERS.

Smith, ANDREW JACKSON: soldier; b. in Bucks co., Pa., Apr. 28, 1815; graduated at the U. S. Military Academy; appointed in the army a second lieutenant of the First Dragoons July, 1838, of which regiment he became major in May, 1861 (known as the First Cavalry Aug., 1861), and July, 1866, colonel of the Seventh Cavalry. Prior to 1861 he served almost continually with his regiment on the frontier. In Oct., 1861, he was commissioned colonel of the Second California Cavalry, and Mar. 17, 1862, a brigadier-general of volunteers. He was engaged in the assault of Chickasaw Bluffs (Dec. 27-29, 1862), and later in the assault and capture of Arkansas Post (Jan. 11, 1863). In command of a division of the Thirtieth Army-corps, he took part in the siege and assaults of Vicksburg and in the subsequent capture of Jackson, Miss. In the Red river campaign he commanded the force (composed of detachments of the Sixteenth and Seventeenth corps) which captured Fort De Russy, and was engaged in the battle of Pleasant Hill. Next ordered to Missouri, he aided in driving Price from that State, then was called to re-enforce Gen. Thomas at Nashville, and engaged in the battle of Nashville and pursuit of Hood's army. Recalled to Gen. Canby's command in Feb., 1865, he commanded the Sixteenth Corps in the reduction and capture of Mobile, Ala. In Jan., 1866, he was mustered out of the vol-

unteer service, and in May, 1869, resigned his commission in the regular army. The brevets of colonel, brigadier-general and major-general were bestowed on him for gallantry at Pleasant Hill, La., Tupelo, Miss., and Nashville, Tenn. He was reappointed colonel of cavalry Jan. 22, 1889, by act of Congress and placed on the retired list on same date.

Smith, BUCKINGHAM: bibliographer and historian; b. on Cumberland island, Ga., Oct. 31, 1810; graduated at the Cambridge Law School 1836; was elected to the territorial legislature at Florida; was secretary of legation at Mexico 1850-52, and at Madrid 1855-58; and subsequently settled in Florida, where he was a judge and a member of the State Senate. He made special and important researches in Mexican history and antiquities, Indian philology, and the early Spanish expeditions in North America. Besides aiding Bancroft, Sparks, and Parkman in their researches, he edited translations of the *Narrative of Cabeza de Vaca* (1851); *Letter of Hernando de Soto and Memoir of Hernando de Escalante Fontaneda* (1854); and translated, with copious notes, *Narratives of the Career of Hernando de Soto in the Conquest of Florida* (1868). In 1864 he published *An Inquiry into the Authenticity of Documents concerning a Discovery of North America claimed to have been made by Verrazano*. D. in New York, Jan. 5, 1871. A portion of his library was secured for the New York Historical Society.
HERBERT H. SMITH.

Smith, CHARLES EMORY, LL. D.: journalist; b. at Mansfield, Conn., Feb. 18, 1842; graduated at Union College in 1861; became editor of the *Albany Express* in 1865, of the *Albany Journal* in 1870, and of the *Philadelphia Press* in 1880. He was president of the New York State Press Association in 1874, a delegate to the national Republican conventions of 1876 and 1888, and U. S. minister to Russia 1890-92.

Smith, CHARLES FERGUSON: soldier; b. in Philadelphia, Pa., Apr. 24, 1807; graduated at the U. S. Military Academy in 1825, entering the army as a lieutenant of artillery. From 1829 to 1842 he served at the Military Academy in various capacities. In the Mexican war, as captain of artillery, he served with distinction, and received the brevets of major, lieutenant-colonel, and colonel. Appointed lieutenant-colonel of the Tenth Infantry in 1855, he commanded the Red river expedition in 1858, engaged in the Utah expedition in 1857-61, for a time was in command of the department of Utah, and was in command of the city and department of Washington Apr. 10-28, 1861. On Aug. 31, 1861, he was appointed a brigadier-general of volunteers, and ordered to Kentucky. In September he became colonel of the Third Infantry. In the operations about Forts Henry and Donelson he acquired a high reputation. In the fight for the possession of the latter stronghold he led the division which had held the left of the investing lines of the Union army, and which stormed and captured all the high ground on the Confederate right, which commanded Fort Donelson. Gen. Smith was then selected to command the movement up the Tennessee, and on Mar. 21 was promoted to be major-general of volunteers. D. at Savannah, Tenn., Apr. 25, 1862.

Smith, CHARLES FORSTER: professor of Greek; b. in Abbeville co., S. C., June 30, 1852; educated at Wofford College, Harvard and Leipzig Universities; Ph. D., Leipzig, 1881; Professor of Greek and German, Wofford College, 1875-79; Assistant Professor Ancient Languages, Williams College, 1881-82; Professor of Modern Languages, Vanderbilt University, 1882-83; Professor of Greek, Vanderbilt University, 1883; Professor of Greek, University of Wisconsin, 1894; author of *Thucydides: Book III. and Book VII.* of College Series of Greek Authors; vice-president American Dialect Society 1891.

Smith, Sir DONALD ALEXANDER, D. C. L.: member of Canadian Parliament; b. in Morayshire, Scotland, in 1821, and educated there. He was for many years in the service of the Hudson Bay Company, and is resident governor and chief commissioner of that corporation in Canada; is president of the Bank of Montreal, and a director of the Canadian Pacific Railway. He was appointed a member of the Executive Council for the Northwest Territories in 1870; represented Winnipeg and St. John in the Manitoba Assembly 1871-74; Selkirk in Dominion Parliament 1871-78; and Montreal West in that body 1887-95. He was knighted in 1886 for his services in connection with the construction of the Canadian Pacific Railway.
NEIL MACDONALD.

Smith, EDMUND KIRBY: soldier; b. at St. Augustine, Fla., May 15, 1824; graduated at the U. S. Military Acad-

1845) and entered the army as brevet second lieutenant of volunteers. In the war with Mexico he distinguished himself, and was promoted first lieutenant and captain for gallantry at Cerro Gordo and Contreras. From 1849 to 1862 he was Assistant Professor of Mathematics at West Point, transferred to the Second Cavalry in 1855 with the rank of captain, he acted on frontier duty, and was severely wounded in a fight with the Comanche Indians in Texas, May 23, 1861. In Jan., 1861, he became major of his regiment, but resigned Apr. 6; was again after appointed a brigade-major in the Confederate army, and served under Gen. Joseph Johnston in Virginia. At the battle of Bull Run, July 21, 1861, he arrived on the field with Elzey's brigade toward the close of the action, but was soon disabled by a shot, then Elzey assumed command. Made major-general in 1862, he was transferred to East Tennessee, and placed in command of that department. Under Bragg he led the advance in the invasion of Kentucky; he routed the Union forces at Richmond, Ky., Aug. 30, and advanced to Frankfort. Promoted to the grade of lieutenant-general, he was captured at the battle of Perryville, Oct. 8, and in the battle of Mary's Landing, Dec. 31, 1862-Jan. 3, 1863. He was soon after made general, and in command of the Trans-Mississippi department, opposing Banks in the Red river campaign, and engaged in the battle of Jenkins's Ferry, Apr. 30, 1864. He was the last to surrender the forces under his command, May 26, 1865. He filled the positions of vice-president Pacific and Atlantic Telegraph Company 1866-68, president Western Military Academy 1869-70, chancellor of the University of Nashville, Tennessee, 1870-74, and Professor of Mathematics in the University of the South from 1873 till his death at Sewanee, Tenn., Mar. 28, 1901.

Revised by JAMES MARCH.

Smith, Eli, D. D.; missionary; b. at Northford, Conn., Sept. 15, 1801; graduated at Yale College 1821, at Andover Seminary 1824; went to Malta as superintendent of a missionary operation establishment 1826; traveled with Dr. Anderson through Greece 1829, and with Dr. Harrison G. O. Dwight, of Constantinople, through Armenia, Georgia, and Persia 1830-31—a tour which resulted in the establishment of the American Armenian and Nestorian missions of the American Board; visited the U. S. and published *Ministry Researches in Armenia* (2 vols., Boston, 1833); settled at Beirut (1834); accompanied Dr. Edward Robinson in his geographical explorations of Palestine, to which he largely contributed, 1838 and 1852; resided in the U. S. 1839 and 1855; introduced an elegant font of Arabic type, cast under his supervision at Leipzig, for the mission press, 1839, and was engaged from 1847 upon a new translation of the Bible into Arabic, completed by Dr. C. V. Van Dyke. D. at Beirut, Jan. 11, 1857.

Revised by G. P. FORD.

Smith, Elizabeth Gares (Prince); author; b. at Uxbridge (then North Yarmouth), Me., Aug. 12, 1806; resided from infancy in Portland, Me.; married there in 1823 Seth Smith, editor and humorist, whom she aided in his journalistic enterprises; obtained a considerable local reputation as a writer of prose and verse, but never appeared publicly as an author until after the loss of her husband's fortune in 1839; settled in New York 1842. Her contributions to the magazines were partially collected in several volumes, of which the best known was *The Sinless Child and Other Poems* (1847). She also published two tragedies, *The Roman Tribune* and *Isaac Leiser* (1853); *Riches without Wings* (1858); *The Western Captive* (1859); *Woman and her Needs* (1854); *The Newberry* (1855); *The Two Wives* (1856); *Kitty Howard's Journal* (1871); and other books. She lectured before lyceums, occasionally preached, and was a prominent advocate of woman's rights. D. at Hollywood, N. Y., Nov. 4, 1893.

Revised by H. A. DAVIS.

SMITH, EMILY ANNAN (Phill); scientist; b. at Marcelus, N. Y., Apr. 26, 1837; educated at Mrs. Willard's seminary at Tarry, N. Y.; married Simon H. Smith, of Jersey City, in 1855; while educating her sons in Europe studied in Germany mineralogy, geology, crystallography, and other branches of science; also visited and investigated the amber-burrows on the coast of the Baltic Sea. She was the first woman elected fellow of the New York Academy of Sciences, and the first woman appointed an officer in the American Association for the Advancement of Science, being at the time of her death secretary of the section of anthropology. In 1889 Mrs. Smith became one of the salaried members of the board of ethnology, Smithsonian Institution, and was elected to study the language, customs, myths, and prehistoric

history of the Iroquoian Indians. She spent two summers among the Tuckermans in Canada, who adopted her as a member of the tribe, and compiled an Iroquois-English dictionary. In 1885 she was appointed by Gov. Abbott commissioner of the department of woman's work to represent the State of New Jersey at the New Orleans Exposition. D. in Jersey City, June 6, 1892.

J. W. POWELL.

Smith, FRANKS HENRY, A. M.; soldier; b. at Norfolk, Va., Oct. 18, 1812; graduated at the U. S. Military Academy in 1836, and entered the army as a brevet second lieutenant of artillery; second lieutenant Nov. 30, 1838. In 1838 he resigned from the army, and in 1847 was appointed Professor of Mathematics at Hampden-Sydney College, Virginia. Upon the organization of the Virginia Military Institute at Lexington, Va., in 1880, he was appointed its superintendent and principal professor of mathematics, the duties of which positions he performed until Jan. 1, 1890. Resigning professor until his death. Soon after the outbreak of the civil war the professors and assistants went into the Confederate army, and Smith, as colonel of a Virginia regiment, was stationed at the city of Norfolk and in command of the fort on Craney Island. The institute was subsequently reopened. He was the author of various educational works. D. at Lexington, Mar. 21, 1890.

Smith, FRANCIS HENRISSOT; landscape-painter and author; b. in Baltimore, Md., Oct. 24, 1855. He is by profession a civil engineer, and has built a number of public works, some for the U. S. Government. As a painter he is self-taught, paints principally in watercolor, and is a member of the American Water-color Society. He is an accomplished writer of fiction and descriptive articles, and well known as an illustrator. His water-colors of scenes in Venice are freely and cleverly painted.

W. A. C.

Smith, Sir FRANCIS PETER; inventor; b. at Hythe, Kent, Feb. 9, 1802; constructed in 1834 a model of a steam-vessel to be propelled by a screw driven by a spring; made a larger boat on the same principle, which he successfully used in the English Channel 1837; constructed for the British navy the screw steamer *Archimedes* of 237 horse-power (finished 1840), the success of which led to the rapid introduction of screw-vessels into the navy and the mercantile marine. He was knighted in 1871. D. in London, Feb. 11, 1874.

Smith, GEORGE; Assyriologist; b. in London, England, Mar. 26, 1840. He became interested in Assyriology by having to engrave some cuneiform signs for publication. Appointed to a position in the Assyrian department of the British Museum he rapidly became, by his industry, insight, and remarkable memory one of the greatest promoters of Assyriology. In connection with Sir Henry Rawlinson he edited vols. III-IV of *The Cuneiform Inscriptions of Western Asia* (1870, 1875), a monumental work. In 1872 he discovered among the clay books in the British Museum fragments of a story of the Deluge similar in the biblical version. *The Daily Telegraph* newspaper then sent him to Nineveh to make further search for clay books in the ruins of Ashurbanipal's palace. This expedition was successful, and was followed by two others for the museum. On the third expedition he died of fever at Aleppo, Aug. 19, 1876. The Deluge story proved to be part of a great poem written on twelve tablets. The whole was published, so far as recovered, in *The Chaldean Account of Genesis*, of which there have been several editions. His other works are *Assyria, from the Earliest Times till the Fall of Nineveh* (London, 1875); *Assyrian Discoveries* (1875), an account of his own travels and researches; *The Assyrian Epigraphic Canon* (London, 1876); *History of Babylon*, ed. by A. H. Sayce (1877); *History of Sennacherib*, ed. by A. H. Sayce (London, 1878); a work similar to the *History of Ashurbanipal*; and numerous articles in the *Transactions of the Society of Biblical Archaeology*, etc.

D. G. LLOYD.

Smith, GEORGE ANAN, D. D.; clergyman and author; b. in Calcutta, India, Oct. 19, 1836; was educated at the University and New College, Edinburgh, and the Universities of Tübingen and Leipzig; traveled twice extensively in Egypt and the Holy Land; was assistant to Brechin Free church 1860; in charge of the chair of Hebrew in Free Church College, Aberdeen, 1880-82; first minister of Queen's Cross church, Aberdeen, 1882-82; since 1892 Professor of Hebrew and Old Testament Exegesis in Free Church College, Glasgow. Dr. Smith has published *The Book of Isaiah in The Expositor's Bible* (London and New York, vol. I,

1888; 7th ed. 1894; vol. ii., 1890; 3d ed. 1894); *The Preaching of the Old Testament to the Age* (London and New York, 1893); *The Historic Geography of the Holy Land* (London and New York, 1894); with Bartholomew, the Scottish cartographer, *Historical Atlas of the Holy Land* (1895); and many articles for reviews. C. K. HORT.

Smith, GERRIT: philanthropist; b. at Utica, N. Y., Mar. 6, 1797; son of Peter Smith, a proprietor of vast tracts of land in Central and Northern New York; graduated at Hamilton College 1818; took up his residence at Peterboro, Madison co., N. Y., devoting himself to the management of his great landed estate; became a member of and liberal contributor to the Colonization Society 1825, but withdrew from it 1835, when he connected himself with the American Anti-Slavery Society, of which he was thenceforth one of the leading members; was elected to Congress 1852, but resigned after a single session; was a liberal contributor to the Free-soil campaign in Kansas; gave pecuniary aid to John Brown 1859 when preparing the attack on Harper's Ferry, though, it is believed, without a knowledge of that project; was nominated for Governor of New York in 1840 and in 1858, at the latter time on a platform of abolition and prohibition; joined Horace Greeley in signing the bail-bond of Jefferson Davis 1867; wrote, printed, and distributed many pamphlets on slavery and other reforms; built a non-sectarian church at Peterboro, in which he sometimes preached. D. in New York, Dec. 28, 1874. Author of *Speeches in Congress* (1855); *Sermons and Speeches* (1861); *The Religion of Reason* (1864); *The Theologies* (1866); and *Nature the Base of a Free Theology* (1867). See his *Biography*, by Frothingham (New York, 1878).

Smith, GOLDWIN, LL. D., D. C. L.: author; b. at Reading, England, Aug. 13, 1823; educated at Eton and at Oxford, where he graduated in 1845, and became a fellow of University College in 1847; called to the bar in 1847, but never practiced law. In 1850 he was appointed by the Government assistant secretary of the royal commission on the state of Oxford University; was secretary of the second Oxford commission; a member of the popular education commission in 1858; Regius Professor of Modern History in Oxford University 1858-66, and Professor of English and Constitutional History in Cornell University 1868-71. He ably championed the cause of the U. S. Government during the civil war; visited the U. S. in 1864 to deliver a series of lectures, and was given the degree of LL. D. by Brown University. In 1871 he removed to Toronto, Canada; was for a time a member of the senate of Toronto University; edited *The Canadian Monthly* 1872-74, and subsequently founded *The Week* and *The By-stander*, the latter of which is not now published. Since his removal to Canada he has persistently advocated the annexation of that country to the U. S. In addition to numerous magazine articles he has published the following among other works: *Lectures on the Study of History* (1861); *Irish History and Irish Character* (1861); *The Empire* (1863); *Three English Statesmen* (1867); *Couper* (English Men of Letters Series, 1880); *A Trip to England* (1888); *Jane Austen* (Great Writers Series, 1890); *Canada and the Canadian Question* (1891); *The Moral Crusader, William Lloyd Garrison* (1892); *The United States: an Outline of Political History, 1492-1871* (1893); *Bay Leaves: Translations from the Latin Poets* (1893); and *Essays on Questions of the Day* (1894). N. M.

Smith, GREEN CLAY: soldier; b. at Richmond, Ky., July 2, 1830; served as a volunteer in the Mexican war, gaining the rank of lieutenant of cavalry; graduated at Transylvania University 1850, and at Lexington, Ky., Law School; became a lawyer at Covington; was a member of the Kentucky Legislature 1861, and a decided Union man; became colonel of the Fourth Kentucky (Union) Cavalry Mar., 1862, and brigadier-general of volunteers June, 1862; resigned Dec. 1, 1863; was a member of Congress 1863-66; a delegate to the Baltimore convention 1864; Governor of Montana Territory 1866-68; entered the Baptist ministry, being ordained in 1869. In 1876 he was the candidate of the Prohibitionists for the presidency.

Smith, GUSTAVUS WOODSON: soldier; b. in Scott co., Ky., Jan. 1, 1822; graduated from the U. S. Military Academy July 1, 1842; appointed to the Engineer Corps, and for two years engaged in the construction of fortifications at New London harbor; Assistant Professor of Engineering at West Point 1844-46; commanded the sappers, miners, and pontoniers during the siege of Vera Cruz and during the subsequent operations of the war with Mexico, receiving the

brevets of first lieutenant and captain for gallantry at Cerro Gordo and Contreras. He was principal Assistant Professor of Engineering at West Point 1849-54, when he resigned from the army. He was subsequently employed in the construction of various Government buildings and in the iron-works of Cooper & Hewitt at Trenton, N. J. In 1858 he became street commissioner of New York city; early in 1861 he entered the Confederate army, and in August was appointed a major-general. On May 31, 1862, Gen. Johnston having been severely wounded that day at Fair Oaks, Gen. Smith succeeded to the temporary command of the Army of Northern Virginia, and subsequently commanded at Petersburg, Va. In 1864-65 he was commander of the State forces of Georgia, and was captured at Macon, Ga., Apr. 20, 1865. From 1866 to 1870 he was in charge of the Southwest Iron Company's works at Chattanooga, Tenn., and from 1870 to 1876 was insurance commissioner of Kentucky. He is the author of many works on life-insurance, Confederate war-papers, and criticisms on Confederate battles and leaders.

Smith, HANNAH: author; b. at Wellington, Shropshire, England. Under the pseudonym of *Heba Stretton* she has been a prolific author of novels and stories, including *Jessica's First Prayer* (1866); *The Clives of Burcot* (1867); *Paul's Courtship* (1867); *Healer Morley's Promise* (1875); and *Bede's Charity* (1882). H. A. B.

Smith, HENRY BOYNTON, D. D., LL. D.: theologian; b. at Portland, Me., Nov. 21, 1815; graduated at Bowdoin College 1834; was a tutor there 1836-37, and again 1840-41, between which periods he studied theology at Andover, Bangor, Halle, and Berlin; was pastor of the Congregational church at West Amesbury, Mass., 1842-47; Professor of Mental and Moral Philosophy at Amherst College 1847-50; was Professor of Church History in Union Theological Seminary, New York, 1850-54, and of Systematic Theology 1854-74; after that professor emeritus; was moderator of the General Assembly of the (New School) Presbyterian Church 1863-64; delivered at the meeting of that body at Dayton, O., an address on *Christian Union and Ecclesiastical Reunion*, which was directed toward that union with the "Old School" Church which was afterward consummated, and for which he prepared an essay on the doctrinal basis, *The Reunion of the Presbyterian Churches* (1867); was appointed delegate in 1867 to the meeting of the Evangelical Alliance in Amsterdam, for which he prepared a report *On the State of Religion in the United States*; was the founder and editor of *The American Theological Review* (1859-71), consolidated with *The Presbyterian Review* in 1862, and united with *The Princeton Review* in 1872; and Prof. R. D. Hitchcock in the *Life, Character, and Writings of Edward Robinson* (1864). He published in 1859 a *History of the Church of Christ, in Chronological Tables* (following); was translator in part, and editor, of Gieseler's *Church History* (4 vols., 1859-63; vol. v. published posthumously in 1880); editor of revised translations of Hagenbach's *History of Christian Doctrine* with large additions (2 vols., 1861-62), and Stier's *Words of the Lord Jesus* (1864-65). D. in New York, Feb. 7, 1877. In that same year his friend Dr. Prentiss edited a collection of his discourses and essays entitled *Faith and Philosophy*. In 1881 his *Memoirs* appeared, edited by his wife, and a briefer biography, by his pupil Prof. Lewis French Stearns, appeared in Boston, 1882. Another pupil, Prof. William S. Karr, of Hartford, edited his *Apologetics* (1882), his *Introduction to Christian Theology* (1883), and his *System of Christian Theology* (1884).

Revised by S. M. JACKSON.

Smith, Sir HENRY GEORGE WAKELYN, usually known as Sir HARRY SMITH: soldier; b. at Whittlesea, Cambridgeshire, England, in 1788; entered the army as second lieutenant in the rifle-brigade in 1805; served as assistant quartermaster-general in the campaign of Waterloo; commanded a division in the Kaffir war 1834-35; was appointed adjutant-general to the forces in India 1839; was distinguished at the battles of Gwalior and Maharajpur, being knighted for the latter service 1844; took a prominent part in the war against the Sikhs in the Punjab; was sent to the relief of Ludhiana, and took Aliwal at the point of the bayonet Jan. 28, 1846, capturing sixty-seven guns; re-enforced Lord Gough in time to enable him to win the decisive battle of Sobroa, Feb. 10, 1846; received the thanks of Parliament on the proposal of the Duke of Wellington, and was made a baronet; became governor of the Cape of Good Hope 1847; conducted the Kaffir war of 1851-52, and was made lieutenant-general 1854. D. in London, Oct. 12, 1860.

Smith, Hosea: lawyer and journalist; b. at Litchfield, Conn., N. C., Sept. 3, 1833; son of H. H. Smith, a native of New Hampshire; for several years a professor in the University of North Carolina; educated at the University of Georgia; went to Atlanta 1872 to study law; also taught school at Warmersburg, Ga.; admitted to the bar at Atlanta 1874; expressed Northern Georgia 1875, urging the removal of the state capital from Milledgeville to Atlanta; organized and became president of the Atlanta Evening Journal Company 1887; made the paper very popular in the State through his advocacy in its columns of a low tariff. In 1888 he became Secretary of the Interior.

Smith, Horace: humorist and poet; b. in London, England, Dec. 31, 1779; became a member of the Stock Exchange, in which business he acquired a fortune; was associated with his brother James in writing for several periodicals and in the production of a celebrated volume of poetical narratives entitled *Repected Addresses* (1812); was author of numerous novels which had but moderate success; and of an anonymous volume of humorous prose sketches, *The Two Tricenters* (1836). A collection of his poems was published at London in 1846. D. at Tunbridge Wells, July 19, 1849. A selection from the poetical works of both brothers, including the *Repected Addresses*, and accompanied by a *Memoir*, was published by Epps-Sargent (New York, 1857).

Revised by H. A. Betts.

Smith, James: signer of the Declaration of Independence; b. in Ireland about 1720; was taken to Pennsylvania by his parents, who settled on the Susquehanna 1729; was educated at the College of Philadelphia; became at first a surveyor near Shippensburg; afterward a lawyer at York; raised in 1774 the first volunteer company in the State for the purpose of resistance to Great Britain; was a member of the convention called to consider the expediency of abstaining from importing British goods, and one of the committee to prepare instructions for the representatives; published an *Essay on the Constitutional Power of Great Britain over the Colonies in America*, which gave a powerful impetus to the Revolution; was elected to the Continental Congress 1775-78; signed the Declaration of Independence and was elected to the General Assembly of Pennsylvania 1780. D. at York, July 11, 1806. He was a man of great wit and his odd gestures and drawling utterances added to the effect of his droll speeches.

Smith, John: adventurer; b. at Wiltshire, Wiltshire, England, in Jan., 1579; spent four years of his early manhood in military service in the Netherlands; was afterward, according to his own account, engaged in wars against the Turks in Hungary and Transylvania, but there is reason to believe that his wonderful adventures in the East are wholly or in part fictitious. Returning to England, by way of Barbary, he was induced by Capt. Bartholomew Gosnold to take part in the colonization of Virginia (1606), then being carried into effect, and brought to bear with such effect his military renown upon the directors of the "London Company" that his name was placed on the secret list of seven persons appointed members of the council. During the long voyage to Virginia (1607) Smith was placed under arrest on an accusation of sedition, and, though liberated on arrival at Jamestown, Va., where the colony was located, he was excluded from his place in the council. He accompanied Capt. Newport in his voyage of exploration up James river as far as the present site of Richmond; was on their return admitted as a member of the council; took part in the disturbance which resulted in the removal from office of Wingfield, the president of the colony, against whom he successfully brought a suit for slander; was intrusted with the command of several expeditions into the interior, partly for the purpose of exploration, but chiefly with the object of obtaining food. He repressed with severity the proposals of some of the settlers to return to England, upon which charge he caused Capt. George Kendall to be condemned and executed. Upon one of these expeditions in Dec., 1607, Smith was taken prisoner, and detained for some time, though kindly treated by the Indian chieftain *Waucombec* (incorrectly called by many writers the "emperor" Powhatan). The famous incident of the preservation of his life by Pocahontas (or Amoras) was related of this captivity, but there is little doubt that the whole adventure is fictitious. On being carried back to Jamestown by the Indian chieftain, Smith was tried by his fellow countrymen for the death of two of his companions, said to have been killed by the Indians through his imprudence,

and was condemned to be executed the next day, but his life was saved by the opportune arrival of Capt. Newport with reinforcements and provisions. In the following year Smith made two extended surveys of Chesapeake Bay and its tributary waters, of which he made a map, became president of the council 1609; had several skirmishes with hostile Indians, who at one time mutilated the destruction of Jamestown. His departure from Virginia, to which he never returned, took place in Sept., 1609, and was attributed by himself to his having been burned by an explosion of gunpowder, but another account states that he was sent to England a prisoner. In 1614 he explored with two ships filled out by some London merchants a large portion of the North American coast, to which he gave the name of New England, and of which he formed a tolerably accurate map, and made a handsome profit by fishing and fur-trading. In 1615 he undertook another voyage to New England for the purpose of founding a colony, but was captured by a French man-of-war and taken to Rochelle. Afterward he claims to have been engaged in "sea-fights for the French against the Spaniards," and to have experienced several remarkable adventures. About 1616 he received the title of admiral of New England, and was thenceforth much engaged in promoting American colonization by means of a series of publications on America, written either by or for him, in which romantic versions of his career in many lands were put forth; but many of the details are contradicted by conclusive proofs, and his several books and pamphlets are not consistent with one another upon some important points. D. in London, June 21, 1631, and was buried in the choir of St. Sepulchre's church. Under the name of Thomas Watson, Smith sent from Virginia a *True Relation of such Discoveries and Accidents of Note as hath happened in Virginia, etc.* (London, 4to, 1608), which was printed in black letter, accompanied by a map, and is the earliest tract published on the subject. It was reprinted, with an introduction and notes, by Charles Deane (Boston, 1867). He was also author of *A Map of Virginia, with a Description of the Country, the Commodities, the People, Government, and Religion, etc.* (Oxford, 1612); *A Description of New England, or the Observations and Discoveries of Captain John Smith (Admiral of that Country) in the North of America in the Year of our Lord 1614, etc.* (London, 1616; reprinted in vol. vi. of series of the *Collections of the Massachusetts Historical Society*, and in *Wines's Tracts: New England's Trials, etc.*, 1620 and 1622); *The General History of Virginia, New England, and the Summer Isles* (1626)—a work including the substance of its predecessors; two treatises on seamanship (1630 and 1637); *The True Travels, Adventures, and Discoveries of Captain John Smith in Europe, Asia, Africa, and America from 1598 to 1629, etc.* (1630); and *Advertisements for the Unexperienced Planters of New England, etc.* (1631; reprinted at Boston, 1855); and was engaged at the time of his death upon a *History of the Sea*, no part of which has been preserved. The *General History* and *True Travels* were republished together at Richmond (2 vols., 1829). A *Letter of John Smith to Lord Bacon*, written in 1618 to recommend to the chancellor's attention the fisheries of New England, was first printed in the *New York Historical Magazine* for 1861. There are biographies by George S. Hillard (in Sparks's Series, vol. 11), W. G. Simms (1846), and George C. Hall (1858). Much light was thrown upon his career by the Hakluyt Society's publication of Strachey's *History of Travels into Virginia Britannia* (1849) from the original MS., and by Charles Deane's notes to his edition of Wingfield's *Discourse of Virginia* (Boston, 1859), in which publications the falsity of the Pocahontas legend was first exposed. In Bryant and Gay's *Popular History of the United States* (vol. 1, 1876) judicious use has been made of the materials above mentioned.

Revised by C. F. Adams.

Smith, John Lawrence, M. D., M. N. A. S.: chemist; b. near Charleston, S. C., Dec. 17, 1818; graduated at the University of Virginia, and at the Medical College of the State of South Carolina 1840; acted as civil engineer on the Charleston and Cincinnati Railroad; pursued his professional studies in France and Germany; began in 1844 the practice of medicine at Charleston, S. C., where he delivered lectures on toxicology; mining engineer (1846-51) to the Turkish Government; aided in the development of cotton-growing in Asia Minor; was instrumental in the discovery of deposits of emery and corundum in the U. S.; invented in 1851 the inverted microscope; was elected in that year

Professor of Chemistry in the University of Virginia; removed to Louisville, Ky.; became a professor in the Medical University of that city; was U. S. commissioner to the Universal Exposition of Paris (1867), Vienna (1873), and Philadelphia (1876); was in 1872 president of the American Association for the Advancement of Science; was a member of the National Academy of Science and of numerous associations; received from the Emperor Napoleon III. the cross of the Legion of Honor; was author of a report to the U. S. Government on *The Progress and Condition of Several Departments of Industrial Chemistry* (1867), as seen at the Paris Exposition, and *Mineralogy and Chemistry* (Louisville, 1873). D. in Louisville, Ky., Oct. 12, 1888.

Smith, JOHN PYE: clergyman and author; b. at Sheffield, England, May 25, 1774; studied at the Independent Academy at Rotherham; became a Dissenting (Independent) minister, and in 1800 resident classical tutor in the theological academy at Homerton; exchanged that post in 1813 for the divinity tutorship, which he filled until 1843; was again classical tutor, and also principal, from the latter date until 1850. For forty-three years he was pastor of the Gravel Pits Chapel, Homerton; took great interest in science, and was elected a fellow of the Royal Society. D. at Guildford, Surrey, Feb. 5, 1851. He was the author of *The Scripture Testimony to the Messiah* (2 vols., 1818-21); *The Mosaic Account of the Creation and Deluge illustrated by the Discoveries of Modern Science* (1837); *Scripture and Geology* (1839); and other works. See *Memoirs of the Life and Writings of John Pye Smith*, by J. Medway, 1853.

Smith, JOHN WILLIAM: legal writer; b. in London, England, Jan. 2, 1809; educated at Trinity College, Dublin; began practice as a special pleader 1831, and was called to the bar at the Inner Temple May 8, 1834; was made a revising barrister in 1840. He was gifted with a remarkable memory, and powers of nice discrimination and lucid exposition. D. in London, Dec. 17, 1845. Besides a *Compendium of Mercantile Law* (1834) and *A Selection of Leading Cases in Various Branches of the Law* (2 vols., 1837-40; 9th ed. 1889), which are of the highest authority, he wrote *An Elementary View of the Proceedings in an Action at Law, Law of Landlord and Tenant*, and other less important works. See *Memoirs in Blackwood's Magazine* (Feb., 1847), *Law Magazine* (Feb., 1846), and *Albany Law Journal* (Dec., 1872).

F. STURGES ALLEN.

Smith, JOSEPH, JR.: Mormon prophet; b. at Sharon, Vt., Dec. 23, 1805; removed while a child, with his parents, to Palmyra, N. Y., where he grew up almost without education, leading an idle and rather disreputable life. According to his own account, he began to have visions at the age of fifteen, and on Sept. 21, 1823, the angel Moroni appeared to him, announcing that God had a work for him to perform, and that buried in the earth in a certain spot a few miles distant was a record inscribed upon gold plates, giving an account of the early inhabitants of America and of their fate; and with this record would be found a kind of spectacles through which alone the writing could be read. Four years after, the angel placed the plates in his hands, together with the spectacles. Smith described the plates as being about 8 inches long, 7 wide, and connected by rings so as to form a volume about 6 inches thick. The plates were inscribed on both sides with hieroglyphic characters in a language no longer extant, but which he was able to decipher and understand by the use of the miraculous spectacles, which he called the Urim and Thummim. Smith professed to have dictated in English the contents of these plates to Oliver Cowdery, who acted as his amanuensis, the plates themselves mysteriously disappearing as they were successively transcribed. The manuscript thus prepared was printed at Palmyra in 1830 under the title, *The Book of Mormon, an Account written by the Hand of Moroni upon Plates taken from the Plates of Nephi. By Joseph Smith, Jr., Author and Proprietor*; and to it was prefixed a certificate signed by Cowdery and two others to the effect that they had seen and handled the plates. Subsequently, all three of the witnesses fell out with Smith, and declared the whole matter to be a hoax. Smith was soon joined by Sidney Rigdon, a printer by trade, who had also aspired to found a new religion, and the two gained a small body of followers, and in 1831 went to Kirtland, O., where they built a temple and set up a fraudulent bank. They were driven away by the citizens in 1838. Smith had in the meantime fixed upon a place in Missouri as the site of his New Jerusalem, and here his adherents had begun to gather; but becoming obnoxious to

the surrounding inhabitants, they abandoned their settlement, and took refuge in Hancock co., Ill., where in 1840 they established themselves in a fine location at the bend of the Mississippi, calling their new home Nauvoo; the town increased so rapidly that in six years the population numbered 15,000. Here Smith soon began to put forth, as occasion demanded, a succession of new revelations, among others one establishing polygamy as an essential feature of the Church of the Latter-Day Saints, and combining in his own person all civil, military, municipal, and sacerdotal authority. A newspaper was set up to oppose him; the presses were destroyed by Smith and his adherents May 6, 1844; warrants were issued for his arrest and that of his brother Hyrum and some others; they refused to obey the writs; the State militia were called out; the Mormons armed themselves, and a conflict was imminent. The Governor of Illinois at length induced the Smiths to surrender and submit to trial, guarantying their personal safety in the interval. They were committed to jail at Carthage, the county-town, and a guard was placed for their protection. On the evening of May 27 a mob assembled, dispersed the guard, and began firing into the door and window of the jail. Hyrum Smith was shot dead; Joseph returned the fire with a revolver until his charges were exhausted, when he endeavored to make his escape by the window, but was shot in the attempt, and fell dead to the ground. See *MORMONS*.

Revised by S. M. JACKSON.

Smith, JOSHUA TOULMIN: author; b. in Birmingham, England, May 20, 1816; educated in the public schools of Birmingham; devoted himself to the Scandinavian languages and literature, in which he became proficient; resided in the U. S. 1837-42; published at Boston his *Normanmen in New England, or America in the Tenth Century* (1839), which was chiefly a translation from the *Antiquitates Americane* (1837); devoted himself, on his return to England, to the study of constitutional and Old Saxon law; was called to the bar 1849; wrote several able legal treatises, especially *The Parish, its Obligations and Powers, its Officers and their Duties* (1854); illustrated in several publications the antiquities of Birmingham, and undertook the preparation for the Early English Text Society of a *History of English Guilds*, a work of immense labor, which, as well as a projected *History of Birmingham*, was left incomplete at the time of his death, which occurred at Lancing, Sussex, Apr. 28, 1869. The *History of English Guilds*, edited by his daughter, Lucy Toulmin Smith, appeared in 1870.

Smith, JUDSON, D. D.: clergyman; b. at Middlefield, Mass., June 28, 1837, graduated at Amherst College 1859, and at the Oberlin Theological Seminary 1863. He was Professor of Latin in Oberlin College 1866-70, and of Ecclesiastical History in Oberlin Theological Seminary 1875-84. In 1884 he was made a secretary of the A. B. C. F. M., Boston, Mass. He is the author of two volumes of historical lectures (privately printed) and of various articles in reviews and other journals, and since 1882 has been one of the editors of the *Bibliotheca Sacra*.

G. P. FISHER.

Smith, MUNROE, J. U. D.: professor of Roman law; b. in Brooklyn, N. Y., Dec. 8, 1854; A. B., Amherst, 1874; LL. B., Columbia, 1877; studied at Berlin, Leipzig, and Göttingen Universities 1877-80 (J. U. D., Göttingen); lecturer on Roman Law, Columbia College, 1880-91; Professor of Roman Law and Comparative Jurisprudence since 1891; instructor in history 1880-83; Adjunct Professor of History 1883-91; contributor to *Johnson's Universal Cyclopædia*, *The Nation*, etc., and managing editor *Political Science Quarterly* 1886-93.

C. H. THURBER.

Smith, NATHAN RYNO, M. D., LL. D.: surgeon; b. at Cornish, N. H., May 21, 1797; graduated at Yale College 1817; took the degree of M. D. at New Haven 1823; was Professor of Anatomy and Surgery in the University of Vermont in 1825; on the organization of the Jefferson Medical College in Philadelphia, became the Professor of Anatomy, but in 1827 accepted the chair of Surgery in the University of Maryland; in 1838 became Professor of Practical Medicine in the Transylvania University, Lexington, Ky.; in 1840 returned to the University of Maryland; invented a method of lithotomy, an excellent suspensory apparatus for fracturing inferior extremities, and wrote *Surgical Anatomy of the Arteries* (1832) and other medical works. D. in Baltimore, Md., July 3, 1877.

Revised by S. T. ARMSTRONG.

Smith, RICHARD SOMERS: soldier and educator; b. in Philadelphia, Pa., Oct. 30, 1813; graduated at the U. S.

Military Academy July 1, 1834; assigned to the Second Infantry as first second lieutenant, but served on topographical duty until 1836, when he resigned to follow the profession of civil engineering. In 1840 he was reappointed in the army, with rank of second lieutenant of infantry; first lieutenant 1846; transferred to the Fourth Artillery 1848. He was Assistant Professor of Drawing at the Military Academy 1840-53; resigned from the army, and was Professor of Mathematics and Drawing in the Brooklyn Polytechnic Institute, which position he retained until 1859. From 1860 to 1861 he was a director of the Cooper Union; on May 14 of the latter year he re-entered the army, with rank of major, and was assigned to the Twelfth Infantry. He served on mustering and disbursing duty until the latter part of 1869, when he rejoined his regiment, and was engaged in the battle of Chancellorsville May 2-4, 1863. Soon after this (May 30) he relinquished his commission to accept the presidency of Girard College, Philadelphia, and held that position until 1873. He was Professor of Civil Engineering in the Polytechnic College of the State of Pennsylvania 1864-70; Professor of Mathematics 1870-73; and 1873-77 at the head of the department of drawing at the U. S. Naval Academy at Annapolis. In 1857 Columbia College conferred upon him the degree of A. M. He was the author of *A Manual of Topographical Drawing* (Philadelphia, 1844) and *Manual of Linear Perspective* (1857). D. at Annapolis, Md., Jan. 30, 1877.

Smith, RICHARD MAYO, Ph. D.: economist; b. at Troy, O., Feb. 9, 1834; A. B., Andover College, 1855; studied at the Universities of Berlin and Heidelberg 1855-77; assistant in history, Columbia College, 1877-78; adjunct professor 1877-81; Professor of Political Economy and Social Science, Columbia College, since 1883; member of the National Academy of Science; honorary fellow Royal Statistical Society; member of the International Statistical Institute; author of *Statistics and Economics* (1888); *Emigration and Immigration* (1890); and numerous magazine articles.

Smith, ROBERT: mathematician; b. in England in 1690; took orders in the Church of England; succeeded his cousin and friend, Roger Cotes, as Professor of Astronomy at Cambridge 1706; edited Cotes's works with commentaries; published *A Complete System of Optics* (2 vols., 1704) and *Harmonics, or the Philosophy of Musical Sounds* (1740), and succeeded Bentley as master of Trinity College 1742. D. at Cambridge, Aug. 1768. By his will he left £2,000 to Trinity College and £2,000 to the university for the support of the astronomical professorship and the maintenance of two annual prizes (since called the Smith prizes) for proficiency in mathematics and natural philosophy.

Smith, ROBERT: brother of Gen. Samuel Smith; b. at Carlisle, Pa., Nov. 1797; served as a volunteer at Brandywine; graduated at Princeton 1781; studied law, which he practiced with distinction at Baltimore; was for some years a member of the Maryland Legislature; was Secretary of the Navy in the cabinet of President Jefferson 1802-05, Attorney-General Mar.-Dec. 1805, and Secretary of State under President Madison 1809-11; was for several years president of the American Bible Society and of the Maryland Agricultural Society, and provost of the University of Maryland. Author of an *Address to the People of the United States* (1811). D. in Baltimore, Nov. 20, 1842.

Smith, ROBERT BARNWELL: See ROBERT.

Smith, ROBERT PAVNE, D. D.: clergyman and author; b. in Gloucestershire, England, Nov. 1516; graduated with honors at Oxford 1541; took orders in the Church of England; became sub-librarian of the Bodleian Library, Oxford, 1567; canon of Christ Church and Regius Professor of Divinity, Oxford, 1655; Dean of Canterbury, in succession to Henry Alford, 1871. He published (in Latin) a *Catalogue of the MSS. in that library*; edited and translated from the Syriac the *Commentary of Cyril of Alexandria on Luke* (1826); translated from the same language the *Ecumenical History of John of Ephesus* (1800); commenced in 1865 the *Delegates of the Clarendon Press a Syriac Testament*, based on that of Grotius (10th fasciculus 1865); is author of *The Authenticity and Mistake Interpretation of the Prophecies of Isaiah conducted in a Course of Sermons preached before the University of Oxford* (1862); *Prophecy a Preparation for Christ* (1863), being the Bampton lectures for that year; *Exposition of the Historical Portion of the Writings of Daniel* (1866); and the commentary on Jeremiah in the series known as *The Speaker's Commentary*, on

Isaiah in the *Commentary of the Society for the Promotion of Christian Knowledge*, on Samuel in *The Pulpit Commentary*, and on Genesis in *Bishop Ellicott's Commentary*. He visited the U. S. as a delegate to the general conference of the Evangelical Alliance in Oct., 1873. He was a member of the Old Testament revision company.

Revised by S. M. JACKSON.

Smith, SAMUEL: soldier; b. at Lancaster, Pa., July 27, 1732; removed in childhood to Baltimore, was some years in his father's counting-house; became a captain in Smallwood's Maryland regiment Jan., 1776; participated in the battles of Long Island, Harlem, and White Plains, and in the retreat through New Jersey; became major in Ouse's battalion Dec. 10, 1776, and lieutenant-colonel 1777; was at the attack on Staten Island and at the battle of Red Bank; was placed by Washington in command of Fort Mifflin, which he gallantly defended from Sept. 26 to Nov. 31, when he was severely wounded and forced to remove to the Jersey shore; received the thanks of Congress and an elegant sword; was at Valley Forge and at the battle of Monmouth, after which he resigned his commission in the army, but continued to serve as colonel of militia; was a member of the Maryland constitutional convention 1776; member of Congress 1783-1803 and 1815-22; U. S. Senator 1823-18; and again 1822-33, serving much of the time as chairman of the finance committee, and occasionally as president pro tempore of the Senate; was major-general of militia at the defense of Baltimore against the British 1814; quelled a formidable mob in 1835, and was thereupon elected mayor. D. in Baltimore, Apr. 22, 1839.

Smith, SAMUEL FRANCIS, D. D.: author and editor; b. in Boston, Mass., Oct. 21, 1808; graduated at Harvard 1829; studied theology at Andover Seminary; became a Baptist clergyman 1832; edited *The Baptist Missionary Magazine* at Boston 1832-33; was a prominent contributor to Dr. Lieber's *Encyclopaedia Americana*; was pastor of a church at Waterville, Me., and Professor of Modern Languages in Waterville College 1834-42; pastor at Newton, Mass., 1842-54; edited *The Christian Review* 1842-49, and for many years was editor of the publications of the Baptist Missionary Union. He published (with Rev. Aaron Shaw) *The Psalmist* (1848); edited a volume of *Lyric Poems* (1844); wrote a *Life of Rev. Joseph Griffin* (1846); and is author of many well-known songs and hymns, including *My Country, 'Tis of Thee* and *The Morning Light is Breaking*. On Apr. 5, 1893, he was given a very enthusiastic reception in Music Hall, Boston, and in many parts of the country the public-school children observed the day by singing his famous song.

Revised by W. H. WARRANT.

Smith, SAMUEL STANHOPE, D. D., LL. D.: scholar; son of Rev. Dr. Robert Smith (1723-93); b. at Peques, Pa., Mar. 18, 1750; graduated at Princeton 1769; was educated at, and became a teacher in, his father's classical academy, pursuing meanwhile the study of theology; was tutor at Princeton 1770-73; was ordained to the Presbyterian ministry 1774; labored as a missionary in Western Virginia; was the first president of Hampden-Sydney College 1775-79; became Professor of Moral Philosophy at Princeton 1779, also Professor of Theology 1788; vice-president of the college 1786, and president 1785; was a member of the committee appointed to draw up a system of government for the Presbyterian Church 1789; was an eloquent and effective pulpit orator and distinguished for courtly manners; published *An Essay on the causes of the Variety of Complexion and Figure of the Human Species* (Philadelphia, 1787); *Sermons* (Newark, N. J., 1793); *Lectures on the Evidences of the Christian Religion* (Philadelphia, 1800); *Lectures on Moral and Political Philosophy* (2 vols., Trenton, N. J., 1812); and *Comprehensive Views of Natural and Revealed Religion* (New Brunswick, N. J., 1815); completed the *History of the United States* (Philadelphia, 1816-17) begun by his brother-in-law, Dr. David Ramsey, and published a number of separate sermons and discourses. He married a daughter of his predecessor, Dr. Witherspoon; resigned the presidency on account of ill health 1812. D. at Princeton, Aug. 21, 1819. Two volumes of his *Sermons* were published posthumously in Philadelphia, 1831, preceded by a brief memoir.

Revised by S. M. JACKSON.

Smith, SERA: journalist and humorist; b. at Rockfield, Me., Sept. 14, 1792; graduated at Bowdoin College 1819; became a journalist at Portland, editing successively the *Argus*, *Family Recorder*, and *Daily Courier*; married Miss Elizabeth Oakes Prince 1823; won a wide reputation as a

humorist by his *Letters of Major Jack Downing* (1833); lost his property 1839; settled in New York 1842; devoted himself successfully to literature, as did also his wife (see SMITH, ELIZABETH OAKES); published *Dewdrops of the Nineteenth Century* (1846); *My Thirty Years out of the Senate* (1859); *Powhatan, a Metrical Romance* (1841); *New Elements of Geometry* (1850); and *Way Down East, or Portraits of Yankee Life* (1855); besides a vast number of uncollected verse and prose essays which appeared in various periodicals. D. at Patchogue, L. I., July 29, 1868.

Revised by H. A. BEERS.

Smith, SYDNEY: clergyman and author; b. at Woodford, Essex, England, June 3, 1771; was educated at Oxford, where in 1792 he became a fellow of New College; resided a few months in Normandy, where he mastered the French language, and in 1794 became curate of a lonely parish on Salisbury Plain. In 1796 he went to Edinburgh, where he remained five years, officiating in an Episcopal chapel; became intimate with Brougham, Jeffrey, and other brilliant young men, who in 1802 started *The Edinburgh Review*, Smith acting as original editor and contributing seven articles to the first number. Soon after this he went to London, where he became a popular preacher, and in 1804-06 delivered courses of lectures on moral philosophy, contributing also to *The Edinburgh Review* until 1827. In 1806 he was presented with the living of Foston-le-Clay, in Yorkshire, worth £500 a year, but situated in a desolate region. In 1809 he went to Heslington, near York, leaving Foston in charge of a curate, hoping to exchange it for a more desirable benefice. Not succeeding in this, he returned in 1814, built a comfortable rectory, in which he lived until 1828, when the chancellor, Lord Lyndhurst, appointed him canon of Bristol, and gave him the rectory of Combe-Florey. In 1831 he was made resident canon of St. Paul's, upon which he took up his abode in London, where he passed the remainder of his life in the discharge of his official duties, in literary labor, and in the pleasures of society, in which he was a great favorite for his wit and rare conversational powers. D. in London, Feb. 22, 1845. Among his most characteristic productions are his *Letters on the Subject of the Catholics, to my brother Abraham, who lives in the Country, by Peter Plymley* (1807-08; published anonymously), which had a large share in bringing about Roman Catholic emancipation. He published several volumes of sermons, many occasional discourses, and political and social essays. His early lectures on moral philosophy were edited by Francis Jeffrey, and published under the title *Elementary Sketches of Moral Philosophy* (1849). Several volumes of selections from his various works have appeared, the best of which is *Wit and Wisdom of Rev. Sydney Smith*, accompanied by a biographical sketch and notes, by Evert A. Duyckinck (1856). His memoirs have been written by his daughter, the wife of Sir Henry Holland (1855). Also see *Life and Times of Sydney Smith* (London, 1884), by Stuart J. Reid.

Smith, WILLIAM: geologist; b. at Churchill, Oxfordshire, England, Mar. 23, 1769; in the practice of his profession as mineral surveyor was led to notice and make maps of the succession of geological strata; he published a *Tabular View of the Order of the Strata, and their Imbedded Organic Remains, in the Neighborhood of Bath* (1799); *Mineral Survey, or Delineations of the Strata of England and Wales* (1815, with sixteen colored maps); *Strata identified by Organized Fossils* (1816-19); *Stratigraphical System of Organized Fossils* (1817); issued between 1819 and 1824 no less than twenty-one colored geological maps of English counties; delivered lectures in most of the provincial towns of England; superintended the model farm of Sir John V. B. Johnstone at Hackness, Yorkshire, 1828-34; received from the Geological Society of London the first Wollaston medal for his important discoveries, and in his later years received a pension of £100 a year. He discovered and was first to apply the principle of the classification and correlation of formations by means of their contained fossils, and has hence been called "the father of English geology." D. at Northampton, Aug. 28, 1839.

Revised by G. K. GILBERT.

Smith, Sir WILLIAM: editor and author; b. in London, England, May 20, 1813; graduated in London University; studied law at Gray's Inn, but never practiced; was for some years Professor of Greek, Latin, and German in the Independent colleges of Highbury and Homerton, and on their consolidation as New College, St. John's Wood, accepted the professorship of the Greek and Latin Languages

and Literature; became classical examiner in the University of London 1858, and editor of *The Quarterly Review* 1867; knighted in 1892. He is widely known by his excellent series of classical dictionaries, having published those upon *Greek and Roman Antiquities* (1840; 2d ed., enlarged and revised, 2 vols., 1891), *Biography and Mythology* (1849), and *Geography* (1852-57), as well as by his *Dictionary of the Bible* (1860-63) and *Dictionary of Christian Antiquities*. He prepared numerous classical schoolbooks, an *English-Latin Dictionary* (1870), a *Biblical and Classical Atlas* (1875), and a series of *Students' Manuals* of ancient and modern history, etc. He was knighted in 1892. D. Oct. 7, 1893.

Smith, WILLIAM ANDREW, D. D.: preacher and educator; b. at Fredericksburg, Va., Nov. 29, 1802; became a preacher of the Methodist Episcopal Church South; in 1846 became president of Randolph-Macon College; in 1866 resigned, and after serving as pastor two years became president of Central College; was a leading member of every General Conference from 1832 to 1866; was appointed at the General Conference of 1866 one of the commissioners on the part of the Southern Church to settle the property question with the Northern Church; wrote *Lectures on the Philosophy and Practice of Slavery* (Richmond, 1860), which may be considered as the fullest and ablest presentation of the proslavery view of the question. D. at Richmond, Va., Mar. 1, 1870.

Revised by A. OSBORN.

Smith, WILLIAM FARRAR: soldier; b. at St. Albans, Vt., Feb. 17, 1824; graduated at the U. S. Military Academy July 1, 1845; appointed brevet second lieutenant of topographical engineers; served as Assistant Professor of Mathematics at West Point, on several surveys, and on lighthouse-construction duty; in July, 1861, was appointed colonel of the Third Vermont, and was engaged in the first battle of Bull Run on the staff of Gen. McDowell. Commissioned brigadier-general of volunteers (Aug. 13), he served in the defenses of Washington until Mar., 1862, and in the Virginia Peninsular campaign of 1862; promoted to be major-general of volunteers July 4, 1862, he led his division in the Maryland campaign, at South Mountain, and Antietam. In Nov., 1862, he was assigned to the command of the Sixth Corps, and engaged at Fredericksburg; transferred to Ninth Corps Feb., 1863. In Oct., 1863, he became chief engineer of the department of the Cumberland and in November of the division of the Mississippi. In Mar., 1864, he was confirmed as major-general of volunteers, and in May assigned to the Eighteenth Corps; on special duty under orders of the Secretary of War Nov., 1864-Dec., 1865. In Nov., 1865, he resigned his volunteer commission, and in Mar., 1867, his commission as major of engineers in the regular army. He was breveted from lieutenant-colonel to major-general; president of the International Telegraph Company 1864-73; appointed police commissioner New York city 1875; president of the board Dec., 1875-Mar., 1881; civil engineer in service of the U. S. since 1881; by act of Congress of Feb., 1889, reappointed major U. S. army, and was retired Mar. 1, 1889.

Smith, WILLIAM LOUGHTON, LL. D.: b. in Charleston, S. C., 1758; educated in England and Switzerland; returned to Charleston in 1783; was a member of Congress 1789-97; an able supporter of the administration of Washington and Adams, and an active opponent of Jefferson, against whom he published a pamphlet; was minister to Portugal 1797-1800, and to Spain 1800-1801. D. in South Carolina in 1812. Author of a volume of *Speeches*, published in London 1794, an *Address* (1794) to his constituents on the difficulties pending with England, a *Comparative View of the Constitutions of the States* (Philadelphia, 1796), and various other political pamphlets.

Smith, WILLIAM ROBERTSON, D. D., LL. D.: theologian and Orientalist; b. at Keig, Aberdeenshire, Scotland, Nov. 8, 1846; studied at Aberdeen, Edinburgh, Bonn, and Göttingen; was appointed Professor of Hebrew in the Free Church College at Aberdeen in 1870; made an extensive journey in Arabia in 1879-80, which he described in a series of exceedingly interesting letters to *The Scotsman*. In 1881 he was removed from his office by an extraordinary act of the General Assembly on account of his critical views of the Old Testament published in the *Encyclopædia Britannica*. In 1883 he was appointed Professor of Arabic in the University of Cambridge; in 1886 librarian to the university, but exchanged the position for the Adams Arabic professorship in 1889, succeeding William Wright. He was associated with

Prof. E. A. Shreve in editing the *Encyclopædia Britannica* from 1881 till Prof. Maynard's death (1891), when he became editor, and edited the work the next year. He was characteristically kind and versatile. D. at Cambridge, Mass., U. 1894. Besides numerous contributions to scientific journals, he published *The Old Testament in the Jewish Church* (Cambridge, 1881); *Israel* (1891); *The Prophets of Israel, and their Place in History in the Close of the Eight Century B. C.* (1891); *Kingship and Marriage in Early Arabia* (1895); *The Religion of the Semites* (1889; new ed. 1894).

Revised by S. M. Jackson.

Smith, Sir William Murray; sailor; b. at Westminster, England, in 1764; entered the navy at the age of twelve as midshipman under Lord Rodney; was captain in the Swedish service in the naval war with Russia, and received a Swedish order of knighthood for gallantry in action; served with distinction under Lord Hood at Toulon Dec., 1793; was taken prisoner by the French at Havre 1796, and confined two years in the Temple, Paris, whence he escaped 1798; was given command of a squadron in Turkish waters the same year, captured a French flotilla at St. Jean d'Acre May 18, and successfully defended that fortress against Napoleon May, 1799; proceeded to Egypt; negotiated the treaty of 42 Arik Jan., 1800; was wounded at the battle of Alexandria 1801; destroyed the Turkish fleet at Abydos 1807; was knighted 1815; became admiral 1821, and lieutenant-general of marines 1830. D. in Paris, May 26, 1840. See his *Life*, by Sir John Barrow (London, 1846).

Smith College: an institution for the higher education of women at Northampton, Hampshire co., Mass. It was founded in 1871 by Miss Sophia Smith, of Hatfield, Mass., who bequeathed funds to furnish women—in her own words—"with means and facilities for education equal to those which are offered in our colleges for young men," with the disinterested purpose that a woman "may be better qualified to enjoy and do well her work in life, whatever that work may be."

Rev. L. Clark Sedgwick, D. D., LL. D., elected in 1879, has been the only president of the college since its foundation. The college was opened for students in 1875, and the first class numbered fourteen. The curriculum comprises three courses—classical, literary, and scientific—each occupying four years. The institution has also schools of music and art, the course in the former requiring three years and in the latter four years for completion. The college is entirely nonsectarian in matriculation and instruction, but students and teachers meet daily for worship, and the study of the Bible is a part of the course. The buildings number eighteen. They comprise College Hall (lectures, hall, lecture-room, reference library, and offices), Little Hall of Science, music hall, Hillyer art gallery (with studies and extensive collection), observatory, botanical plant house, athletic gymnasium (the gift of the graduates), president's house, and two dwelling-houses for students. These buildings are clustered toward the front of the grounds, which stretch a considerable distance in the rear and are ample for outdoor exercise and recreation. The faculty, inclusive of the president, number (1894-95) forty-four; undergraduates, 787.

E. A. Gunsberg.

Smith's Falls: post-village; Laramie County, Ontario, Canada; on Rideau Canal, and on the Canadian Pacific Railway, at the junction of the Perth Branch line map of Ontario, vol. 2-41. The chief industry is the manufacture of axes and agricultural implements. Pop. (1891) 3,364.

Smithson, James; scientist; b. in England about 1765; was a natural son of Hugh Smithson, first Duke of Northumberland; was educated at Oxford, graduating in 1786 under the name of Lewis Mudge; was chosen a fellow of the Royal Society in the following year; devoted himself to science, especially in the fields of chemistry and mineralogy, and published many papers in the scientific periodicals. He was a friend and associate of many of the most learned men of his day, not only in Great Britain, but upon the Continent. He lived usually in Paris, where he was an intimate of Arago, and was a familiar figure in the scientific circles of other European capitals. Sometime between 1791 and 1800 he took the name of Smithson. D. in Genoa, Italy, June 27, 1829. For an account of his magnificent bequest to the U. S. and its employment in the maintenance of a national scientific institute, see *SMITHSONIAN INSTITUTION*.

Smithsonian Institution: an establishment in Washington, D. C., for the advancement of learning under the patronage of the Government of the U. S., organized in 1846. Its founder was James Smithson (see *SMITHSON, JAMES*), whose will was found to contain the following clause in relation to a residuary bequest: "I bequeath the whole of my property to the United States of America, to found at Washington, under the name of the Smithsonian Institution, an establishment for the increase and diffusion of knowledge among men." It is almost certain that he knew Joel Barlow in Paris, and very probable that he was familiar with his plan for a realization of Washington's project for a great national institution of learning in the Federal city. The phrase "an institution for the increase and diffusion of knowledge" occurs in Washington's farewell address (Sept. 19, 1796).

In 1835 the U. S. legation in London was notified that his estate, amounting in value to about £100,000, was held in possession of the accountant-general of the British court of chancery.

As soon as the facts became public great opposition to the acceptance of the gift arose in Congress. Radical statesmen, led by Calhoun and Preston, argued that it was beneath the dignity of the U. S. to receive presents, and that the donor was seeking immortality for too moderate an equivalent. The acceptance of the gift was ardently advocated by others under the leadership of ex-President John Quincy Adams. Richard Rush was finally appointed agent

Smithsonian Institution, Washington, D. C.

to promote the claim. He proceeded to London, entered suit in the court of chancery in the name of the President of the U. S., and, owing to the generous tolerance of the British authorities, brought the matter to a conclusion in less than two years. The decision was favorable. The legacy was received by Mr. Rush in the form of 104,960 sovereigns, which were delivered by him Sept. 1, 1838, to the Philadelphia mint, and immediately received into U. S. money, producing \$508,318.46, the first installment of the legacy. This

was soon after increased to \$515,169, and in 1867 by a residuary legacy of \$26,210.63 to \$541,379.63, the total sum derived from the founder's beneficence, which by careful management had been in 1867 increased to \$650,000. At one time in the early history of the institution a large portion of its fund was in certain State bonds which became worthless: Congress appropriated money to make good the loss, and the permanent fund is held as a deposit at 6 per cent. in the U. S. treasury.

During the eight years that passed before any use was made of the money public opinion had an opportunity to shape itself, and the organization in Washington in 1840 of the National Institution (afterward the National Institute), which was intended by its promoters to become the nucleus for the development of Smithsonian's idea, gave opportunity for much experimental study in administration. The National Institute, which was for two or three years the largest and most active scientific society on the continent, developed many features which were ultimately adopted for the Smithsonian Institution and experimentally demonstrated that others were impracticable. It languished and died soon after the organization of the Smithsonian Institution, which it had hoped to incorporate with itself.

Administration.—The Smithsonian Institution was formally established by the act of Congress approved Aug. 10, 1846. As defined in the act of establishment it is composed of the President of the U. S., who is presiding officer *ex officio*, the Vice-President, the members of the cabinet, and the chief justice, and the "establishment" thus constituted is made responsible for the duty of "the increase and diffusion of knowledge among men."

In addition to the "establishment" the act provides for a "board of regents," by whom the business of the institution is administered, and which is composed of the President of the U. S., the chief justice of the Supreme Court, three members of the Senate, three members of the House of Representatives, and six citizens appointed by joint resolution of the Senate and House of Representatives, no two of whom may be from the same State, though two must be residents of the District of Columbia.

The presiding officer of the regents is the Chancellor, whom they elect from their own number. This position is customarily held by the Chief Justice. The executive officer is the secretary of the institution, who is also elected by the regents. The duties and responsibilities of the secretary are such as in other institutions usually belong to the office of director, but the name of "secretary" is that which in Washington designates the highest grades of executive responsibility. The secretary makes all appointments on the staff of the institution, is responsible for the expenditure and disbursement of all funds, is the legal custodian of all its property, and *ex officio* its librarian and the keeper of its museum. He presents to the regents an annual report upon the operations, expenditures, and conditions of the establishment, which is transmitted by the board to Congress for publication. By special act of Congress of 1884 an acting secretary is provided in case of the absence or disability of the secretary, the designation being left with the chancellor of the institution. There is at present but one assistant secretary, who is in charge of the National Museum.

The annual meeting of the regents is held in January; their executive committee of three members meets quarterly.

The first meeting of the board of regents took place Sept. 7, 1846, and before the end of the year the policy of the regents was practically determined upon, for, after deciding upon the plan of the building now occupied, they elected to the secretaryship Prof. Joseph Henry, and thus approved his plan for the organization of the institution which had already been submitted to them. Eminent alike as a man of science and an administrator, Henry for more than thirty years directed the activities of the organization.

Objects of the Institution.—These as defined by Henry are, first, to increase knowledge by original investigations and study either in science or literature; and, second, to diffuse knowledge not only through the U. S., but everywhere, and especially by promoting an interchange of thought among those prominent in learning in all nations. No restriction is made in favor of any one branch of knowledge.

The leading features of the plan of Prof. Henry were, in his own words, "to assist men of science in making original researches, to publish them in a series of volumes, and to give a copy of them to every first-class library on the face of the earth." Probably there is not a scientific investigator in the U. S. to whom a helping hand has not at some

time been extended by the institution, and the hand has often reached across the Atlantic. Books, apparatus, and laboratory accommodation have been supplied to thousands, and each year a certain number of money grants have been made. Not less important has been the personal encouragement afforded and advice given in the tens of thousands of replies written each year in response to inquiries.

Publications.—The publications of the establishment, which are regularly distributed to about 4,000 institutions, are as numerous as those of a great publishing-house, and are practically all given away. In addition to the annual report, which contains in its appendix articles of popular interest in regard to scientific progress, there are two series printed at the cost of the Smithsonian fund: (1) *The Smithsonian Contributions to Knowledge*, 28 volumes in quarto containing nearly 15,000 pages and many fine plates. (2) *The Smithsonian Miscellaneous Collections*, in 35 octavo volumes, aggregating about 22,000 pages. Besides these there are the series of *Bulletins* of the National Museum, 50 in number, beginning in 1875; the *Proceedings* of the National Museum, including already 1,100 separate papers, embraced in 17 annual volumes, beginning with 1878; the *Annual Reports* of the Bureau of Ethnology, beginning in 1879 and forming a series of 12 illustrated volumes in royal octavo; and the *Bulletin* of the bureau, of which 26 numbers have appeared. The value of the books distributed since the institution was opened can not be much less than \$1,000,000, estimating at standard publishers' rates.

In return for its own publications, and by purchase, the institution has received the great collection of books which form its library, and which is one of the richest in the world in the publications of learned societies. This includes more than 300,000 titles, the greater portion of which, by permission of Congress, have been placed in the National Library at the Capitol, where they are kept by themselves as the Smithsonian Deposit. The working libraries of the National Museum and the Bureau of Ethnology are distinct from the general Smithsonian Library, and separately administered.

System of Exchanges.—The Smithsonian system of international exchanges, begun in 1852, had for its object the free interchange of scientific material between scientific institutions and investigators in the U. S. and those in foreign lands, and its results have affected beneficially the libraries of most of the learned institutions in America. In 1867 Congress assigned to the institution the duty of exchanging fifty copies of all public documents for similar works published in foreign countries. Finally, in 1882 a definite treaty, made previously at Brussels, was formally proclaimed by the President of the U. S., wherein the U. S. Government, with a number of others, undertook the continuation of the exchange service on a more extensive basis. Out of this has grown the Bureau of International Exchanges, for the maintenance of which Congress partially provides by annual appropriation. From 1852 to 1893 the Smithsonian exchange service handled 1,175,000 packages. The number of correspondents upon its lists is about 24,000.

The National Museum.—The Smithsonian is by law the custodian of the National Museum, of which the secretary of the institution is the legal keeper. This museum is supported entirely by the Government, but previously part of its maintenance was from the Smithsonian fund. It is the only lawful place of deposit of "all objects of art and of foreign and curious research, and all objects of natural history, plants, and geological and mineralogical specimens, belonging, or hereafter to belong, to the U. S., which may be in the city of Washington in whosever custody." The nucleus of these collections consists in the specimens brought home by the Wilkes and other early exploring expeditions, but for many years the museum was supported entirely at the expense of the Smithsonian fund, and a considerable portion of the collections is the property of the institution. See NATIONAL MUSEUM OF THE UNITED STATES.

Bureau of Ethnology.—The Bureau of American Ethnology is an outgrowth of activities begun in the early days of the history of the institution, and has for its object the investigation of the languages, habits, customs, and classification of the North American Indians. In 1879 a special appropriation was made by Congress for this work, which is (1895) still in progress under the direction of Maj. John W. Powell, who has been the director of the bureau from the start. With the aid of a well-trained staff, he has rescued from destruction a vast amount of important material in regard to the early inhabitants of the continent, priceless

not only in studies of American ethnology, but in the study of mankind as a whole.

Astrophysical Observatory.—Under the immediate direction of the present secretary an astrophysical observatory has been established, in which important investigations upon the constitution of the sun are being carried on.

The National Zoological Park established by Congress in 1891, under the direction of the institution, occupies a tract of 196 acres on Rock Creek, 2 miles N. of the center of the city. The grounds are nearly twice as extensive as those of any other zoological park, and are possessed of admirable natural advantages, but the appropriations for the development of the park have not been sufficient to allow of any satisfactory progress.

The American Historical Association is by law affiliated with this institution, and transmits its annual reports to Congress through the secretary.

The institution supports a table at the International Zoological Station in Naples for the benefit of American naturalists.

An important feature of the institution's work has been its participation in the various expeditions. It was represented at Philadelphia in 1876, Berlin 1880, London 1893, New Orleans 1895, Cincinnati 1899, Madrid 1902, and Chicago 1904, and on each occasion received awards of the most commendatory nature.

There is an assembly hall in the museum building, in which meetings of scientific bodies of national scope are held. There the National Academy of Sciences holds its annual meeting every April, and the American Historical Association its December meeting. Here also each year a course of popular scientific lectures is delivered under direction of the scientific societies of Washington.

The office of secretary has been held by three men: Joseph Henry, elected in 1846, Spencer Fullerton Baird, in 1877, and Samuel Pierpont Langley, in 1888. Each in addition to his general administrative work in the institution has made some feature of the general plan peculiarly his own. Secretary Henry, besides establishing the general policy of, gave special attention to, the publications, the system of international exchanges, the library, and the development of that great system of meteorological observation and another prediction which has since been transferred to another department of the Government, and now constitutes the Weather Bureau.

Secretary Baird continued the development of the museum, which had been under his special charge during his twenty-seven years of service as assistant secretary, secured the erection of the new museum building, gave much attention to explorations, and carried on, in connection with his special work as U. S. commissioner of fisheries, a most extensive biological investigation of the waters of North America.

To Secretary Langley is due the establishment of the National Zoological Park, and of the astrophysical observatory, and a new system of encouragement of original research in the physical as well as in the biological sciences. Under his administration also important donations and bequests have been added to the permanent fund of the institution. The limit of \$1,000,000, which may by law be permanently deposited in the U. S. treasury at 6 per cent., has nearly been reached, and Congress has recognized the authority of the institution to receive and administer other funds, beyond the above-named limit, thus making it possible for it to undertake the administration of financial trusts for any purpose within the scope of its general plan, preserving in connection with each fund the name of the person by whom it was established. This privilege has already been accepted by several benefactors. The Hodgkins fund, derived from the gift of Thomas H. Hodgkins, is being thus administered, in addition to the Hodgkins medal, which is to be awarded from time to time for important discoveries in regard to atmospheric air. The Avery fund, the bequest of Robert P. Avery, provides for special investigations in the fields of acoustics, electricity, etc.

Buildings.—The building occupied by the institution and bearing its name is an ornate structure of Seneca brownstone, occupying a prominent place in the Mall which extends from the Capitol to the Washington Monument—in a square known as the Smithsonian Grounds. It was planned by James Renwick, Jr., and was in construction from 1847 to 1855. The temporary wooden structure occupied by the astrophysical observatory stands in the rear of the Smithsonian building, and the National Museum building, of brick,

225 feet square, is at its eastern end. The Herbarium of Botany occupies rented quarters in the city, and the offices of the Zoological Park are in the park grounds.

14. *Barro Colorado.*

Smithsonite (the mineral *zinc carbonate* ($ZnCO_3$), named after Smithson, who was the founder of the Smithsonian Institution. It crystallizes in rhombohedrons of glassy luster, white when pure, with the hardness of apatite, and denser when pure and normal = 4.451 at 0°; Nannum and Lavy both give 4.45. Smithsonite occurs in the U. S., abundantly at Lancaster, Pa., near Bethlehem, Pa., and at the Perkiomen lead mine.

Smith-Stanley, Edward Geoffrey. See DEERY.

Smoke (O. *fog*, *smog*; Dutch, *smook*; Germ., *schmuck*; Pers., *ab. az. az. az. az.*, smolder); the product of an imperfect combustion. If coal, which is chiefly composed of carbon, hydrogen, nitrogen, and oxygen, be burned perfectly, the result will be carbonic acid, steam, and nitrogen, which substances will escape through the chimney-top and blend with the atmosphere under the form of invisible and incombustible gases and vapor. But as the combustion of coal in the way in which it is generally burned is very imperfect, inflammable gases and vapors and large quantities of fine particles of carbon issue together with the above substances, form soot and black and brown smoke, contaminate the air, and cause a considerable loss of fuel. As coal-smoke is a great nuisance, and in large towns and manufacturing districts even a serious evil, much attention has been paid to the matter of burning it. This is attended with great practical difficulties, arising from the necessity of preventing the smoke from cooling and of supplying the combustible gases and vapors with the necessary amount of oxygen in order to make them burn with flame; but these difficulties are nevertheless not greater than may be generally overcome, as they have been in many single cases. See *Combustion*.

Smokeless Powders: explosives acting without the production of smoke. They may be divided into three classes: 1. Those composed of cellulose nitrate, either the insoluble or soluble variety, or both. 2. Those composed of the constituents of 1 mixed with nitroglycerin or other organic nitrates. 3. Those composed of the constituents of 1 mixed with nitro-derivatives of hydrocarbons, such as picric acid and the picrates. Each of these varieties may contain oxidizing agents like barium or potassium nitrate and retarding agents such as tannin or lysosodium.

Among the best-known and most successful of these powders are of the first class indurite, used by the U. S. navy, and B. N., used by the French; of the second class ballistite, used by the Italians, and cordite, used by the British; and of the third class Peyton powder.

These powders are more or less smokeless because the products of their combustion are wholly gaseous, whereas 55 per cent. of the products of the combustion of ordinary gunpowder is finely divided solids. This property of smokelessness is the feature of these powders which has attracted the widest popular attention; but though it is a desirable property, and one which has modified strategy and tactics, the most valuable property common to these powders is the high velocities which they impart to projectiles and which greatly exceed those which it is possible to secure with black gunpowder.

In order not to endanger the gun it is essential that the pressure developed by the burning powder shall be within prescribed limits. The best powder is that one which gives the maximum initial velocity with the minimum chamber pressure; which gives uniform results when used under uniform conditions; and which undergoes no change, either chemical or physical, under the exposure incident to the military and naval service. The best record thus far reported for any powder is from the firing trials of indurite made at Indian Head proving-ground, Maryland, when 26 lb. of this powder, fired in the 6-inch service-gun, imparted to a 100-lb. projectile an initial velocity of 2,460 feet per second, while it exerted but 18,900 tons pressure on the gun. Repeated rounds gave remarkably uniform results. See *Explosives*.

CHARLES E. MURRAY.

Smolensk: government of European Russia, S. W. of Moscow, and traversed by the Dvina, which runs to the Gulf of Riga, and the Dnieper, which flows to the Black Sea. Area, 21,638 sq. miles, consisting generally of extensive plains interspersed with morasses. The climate is cold, but healthful; the soil is fertile and well cultivated, yielding

large crops of rye, the principal product, and of hemp and flax. Tobacco and hops are also cultivated. On its extensive pastures large numbers of fine cattle are raised, while its vast forests, abounding with game, furnish a large amount of valuable timber. Much attention was formerly paid to the raising of bees, and honey and wax were exported. Copper, iron, and salt are found in considerable quantities. Its manufactures are unimportant. Pop. (1891) 1,412,162.

Smolensk: town; capital of the government of Smolensk, Russia; on the Dnieper; 250 miles W. S. W. of Moscow (see map of Russia, ref. 7-D). It is surrounded by massive walls, that are rapidly falling into decay, and has a magnificent cathedral, an episcopal palace, monasteries, several good educational institutions, including a military school, manufactures of linen, carpets, leather, and soap, and a considerable export trade in grain and flax. Pop. (1891) 38,084.

Smollett, Tobias George: novelist; b. at Dalquhurn House, Cardross, Scotland, in 1721; lost his father in early childhood; was educated at Dumbarton school by the care of his grandfather, Sir James Smollett, of Bonhill, a member of the Scottish Parliament; studied also at Glasgow, where he served an apprenticeship to a surgeon; went to London at the age of nineteen, carrying a tragedy entitled *The Regicide*, which he unsuccessfully offered to the theatrical managers; accepted the position of surgeon's mate in the navy; participated in the unfortunate expedition against Cartagena 1741; resided for some time in Jamaica; returned to England 1746; married in 1747, Miss Anne Lascelles, whom he had known in Jamaica; published in 1748 with great success his first novel, *The Adventures of Roderick Random*, in which he made good use of his West Indian experiences; visited Paris 1750; published *The Adventures of Peregrine Pickle* (4 vols., 1751); after endeavoring to obtain medical practice at Bath, settled at Chelsea 1753, in which year he wrote *The Adventures of Ferdinand, Count Fathom*; published a translation of *Don Quixote* (1755); issued *A Compendium of Authentic and Entertaining Travels* (7 vols., 1757), in which he embodied his own experiences at Cartagena; edited for some time a Tory organ, *The Critical Review*; was fined and imprisoned three months for a libel on Admiral Knowles (1759); wrote in fourteen months a *Complete History of England, deduced from the Descent of Julius Caesar to the Treaty of Aix-la-Chapelle* (4 vols., 1757-58), to which he subsequently added a *Continuation from 1748 to 1760* (4 vols., 1763), of which the later volumes have been often reprinted as a supplement to Hume; translated *Gil Blas* (4 vols., 1761); wrote in prison his *Adventures of Sir Launcelot Greaves* (1762); edited *The Briton*, a newspaper in defense of Lord Bute (1762-63); aided Thomas Franklin and other writers in bringing out a translation of the *Works of Voltaire* (37 vols., 1761-70); made a journey through France and Italy 1763-66, which furnished materials for a work of *Travels* (2 vols., 1766); satirized Bute and the elder Pitt in his *Adventures of an Atom* (1769); went for his health to Italy 1769, and wrote on the journey *The Expedition of Humphrey Clinker* (3 vols., 1771), his best novel. D. at Monte Novo, near Leghorn, Italy, Sept. 17, 1771. Smollett ranks with Richardson and Fielding as one of the standard novelists of the eighteenth century, founders of the English school of prose fiction. He was greatly influenced by Cervantes, Le Sage, and the whole group of Spanish "rogue" or *picaro* novelists. His stories are narratives of low life, travel, and broadly comic adventure, vigorous and racy, but coarse to the verge of brutality. In the persons of Commodore Trunnion, Jack Rattlin, Tom Bowling, and other nautical characters he introduced into fiction the now familiar figure of the British tar. Many complete editions of his novels and poems have been published. Biographies were written by Dr. Robert Anderson (1796), Dr. John More (1797), Thomas Roscoe (London, 1840; New York, 1857), and D. Hannay (Great Writers' Series, 1887).

Smolt: See SALMON.

Smuggling [like Germ. *schmuggeln*, from Low Germ. *smuggeln*; connected with root *smug-* of Germ. *schmiegen*, smuggle up to, and O. Eng. *smigan*, creep]: the (statutory) offense either of bringing into a country articles entirely prohibited, or of defrauding the customs revenue by secretly importing goods upon which duties are laid without paying such duties or without paying the full amount required by law. In Great Britain the offense includes the exporting of goods with like intent, and (as often defined) the introduction of any articles into consumption without paying the

duties chargeable upon them. As the whole subject of the customs revenue is the creature of statute, the offenses which consist in its evasion or violation are also of a statutory origin. In Great Britain and Ireland smuggling is especially restrained by the Customs Laws Consolidation Act of 1875 (39 and 40 Vict., c. 36).

Smuggling in the U. S.—In the U. S. the regulation of this offense belongs exclusively to the jurisdiction of the national legislature and judiciary, being included in the power of Congress to regulate all foreign commerce. The body of the existing law is contained in the *Rev. Stat. of the United States*, especially in tit. xxiv., chap. 10, §§ 3035 to 3094 (although some provisions are scattered through other chapters relating to the imposition and collection of duties), and in the *Supp. of the Rev. Stat. of the United States*, p. 32, seq., where smuggling is defined as "the act, with intent to defraud, of bringing into the United States, or, with like intent, attempting to bring into the United States, dutiable articles without passing the same, or the package containing the same, through the custom-house, or submitting them to the officers of the revenue for examination."

Penalties.—The following penalties may be enforced for various acts which are collectively embraced in the general description of smuggling: (1) The guilty person is liable to a fine of not more than \$5,000 and not less than \$50, or to imprisonment for not more than two years, or to both. (2) The goods fraudulently introduced or attempted to be introduced are to be seized, and, if condemned by the court, are to be forfeited and sold. (3) The vessel in which the goods are thus imported may be likewise seized, condemned, and forfeited if the owner or managing agent was consenting to and guilty of the offense. (4) Any vehicle, conveyance, team, boat, etc., by means of which goods are wrongfully brought into the country by land may also be seized and forfeited; but no such conveyances belonging to and used by common carriers, whether persons or corporations, are liable to forfeiture unless the owner, superintendent, or agent in charge is consenting or privy to the illegal importation. (5) Various pecuniary penalties may be visited upon the owners or masters of vessels for certain specific violations of the law, such as resisting or hindering the revenue officers and the like; which penalties are made liens upon, and may be summarily enforced against, the vessels themselves. Cases involving any of the foregoing forfeitures or pecuniary fines are reported to the proper U. S. district-attorney, and it is his duty to prosecute the delinquent or to procure a condemnation of the property in the national courts.

Detection of Smuggling.—The customs officers are clothed with very large powers in order to detect and punish any fraudulent importation or concealment, or failure to pay the full duties required by the law. They may board and search all vessels lying in port, and all those bound to the U. S. while not more than 4 leagues from the coast. They may also search all persons coming into the country, all trunks, boxes, or other baggage, papers, envelopes, all conveyances and means of transport, stores, warehouses, and other buildings—in short, all places or things where the goods themselves or the evidence of their wrongful importation may possibly be concealed. Finally, by means of an order of the court they may obtain an inspection of the books of account and business papers of merchants and others suspected of or charged with the wrongful non-payment of duties. When the property seized is condemned and sold, the proceeds, after paying the costs and expenses, are distributed, part to the U. S., part to the principal customs officers of the district, and part to the informer if there was any distinct from the officer himself who detected the offense and procured the seizure.

Revised by F. STURGES ALLEN.

Smuts [: Germ. *schmutz*, dirt; Dutch, *smet*]: the *Ustilaginæ*, an order of minute parasitic fungi principally attacking the higher plants, and often producing serious injuries to farm and garden crops (Fig. 1). In some portions of England they are known as dust-brands. They consist of slender, branching, colorless threads, which grow through the tissues of their hosts, following the intercellular spaces, or actually penetrating and even filling the cell-cavities. After a period of growth, the threads produce spores in great numbers, forming dark, dusty masses, which have suggested the popular name of these organisms.

No sexual organs are known in any of the smuts, and it is probable that in this group of plants the structural degradation due to excessive parasitism is so great that these organs have been lost. This degradation is shown in the soft-

walled cells composing the filaments, and also in the distorted and irregular spore-bearing masses (Fig. 2) which may be

FIG. 1.—Smut on Indian corn, reduced one-half.

regarded as crushed and distorted spore-sacs (asci). The spores arise within these crushed masses as rounded bodies,

FIG. 2.—Formation of spores: a b c, in *Ustilago maydis*; d e, *U. antherarum*; f, *U. flosculosorum*, magnified 900 times.

which soon acquire a dark-colored, thick, smooth, or rough-walled. At maturity the spores are set free by the deliquescence of the cell-walls of the spore-bearing masses. In a few cases the spores are borne singly, and rarely they appear to be in little distorted ascus-like cells (Fig. 2, c).

The production of spores usually takes place in those parts of the parasite which have penetrated the flowering or fruiting portions of the host, and which as a consequence are generally much distorted (Fig. 1). The spores are distributed by winds, after the rupture of the epidermis of the host and the escape of the surplus moisture.

FIG. 3.—Germination of smut spores: a, *Ustilago avenae*, $\times 1,000$; b, *U. tritici*, $\times 500$; c, *U. hordei*, $\times 700$; d, *Tilletia tritici*; sp., the sporidia, $\times 200$.

minute spores (the sporidia), which are so minute that they may readily be dispersed by the wind. The parasite gains

access to the embryo host plant by penetrating the tender walls of the epidermal cells, and it appears that in many, if not all, cases it is impossible for such penetration to take place when the host has made a considerable growth.

The smuts are divided by Schroeter into two families, as follows:

I. *Ustilaginaceae*, with septate promycelium, bearing lateral sporidia. About 150 species, nearly all of which (143) belong to the genus *Ustilago*.

WHEAT SMUT (*U. tritici*), called also the "loose smut" of wheat, injures the heads of unripe wheat by destroying the kernels, and turning them into black dusty masses of spores (Fig. 4). The spores are very small (about 5.5 by 6.5μ), ovoid or elliptical, and minutely verruculose.

OAT SMUT (*U. avenae*) affects unripe heads of the cultivated oat, destroying them before the ripening of the crop. The spores are larger than the preceding (about 7μ or 8.5 by 8μ), globose or ovoid, and faintly verruculose.

BARLEY SMUT (*U. hordei*) likewise destroys the unripe heads of barley. The spores are nearly of the same size as in the oat smut (about 7μ), globose and smooth.

The three foregoing species have generally been confounded under the name of *U. carbo*, or *U. segetum*, but investigations by Jensen, confirmed by Kellerman, prove them to be distinct. These experimenters have found that these smuts may be greatly reduced by immersing the grains for eight to fifteen minutes in water heated to 56°C . (133°F .), then drying before sowing.

MAIZE SMUT (*U. maydis*) is parasitic upon Indian corn, causing swellings and distortions of the kernels (Fig. 1), and sometimes, also, similarly affecting the staminate flowers, and even the leaves and stems. The spores are large (8 to 13μ), globose and echinulate.

Other species occur on sorghum (*U. sorghi*), foxtail grass (*U. neglecta*), and many other grasses, sedges, knot-weeds, etc.

II. *Tilletiaceae*, with non-septate promycelium, bearing terminal sporidia. About 170 species, distributed among 9 genera, of which the principal are *Tilletia* (33 species), *Entyloma* (41), *Urocystis* (27), *Thecaphora* (18), *Sorosporium* (23).

BUNT, or STINKING SMUT (*Tilletia tritici* and *T. foetens*).—These two species, which differ in the first having reticulated spores and the second smooth ones, are parasitic upon wheat, filling the kernels at maturity with a mass of closely packed, fetid spores (Fig. 5). Both are common in the U. S., Europe, and most other wheat-growing countries. Bunt may be prevented by the hot-water treatment referred to above.

ONION SMUT (*Urocystis cepulae*) attacks the leaves of cultivated onions, often seriously damaging the crop in the eastern parts of the U. S.

LITERATURE.—In addition to the standard works on fungi, the reader is referred to the following: J. B. de Toni, *Ustilaginaceae*, in Saccardo's *Sylloge Fungorum*, vol. vii. (1888);

FIG. 4.—Head of wheat affected by *U. tritici*, reduced to one-half natural size.

FIG. 5.—a, head of wheat affected with bunt; b, kernels filled with spores, \times one-half; c, spores of *T. tritici*, $\times 200$; d, spores of *T. foetens*, $\times 200$.

J. Schroeter, *Die Pilze Schlesiens* (1889); C. B. Plowright, *A Monograph of the British Uredineæ and Ustilagineæ* (1889); Kellerman and Swingle, *Report on the Loose Smut of Cereals, in Second Annual Report of the Experiment Station of the Kansas Agricultural College* (1889).

CHARLES E. BESSEY.

Smyrna [= Lat. = Gr. *Σμύρνα*, myrrh]: city; in the vilayet of Aidin, Asia Minor; in lat. 38° 25' N. and lon. 24° 50' E., at the eastern extremity of the Gulf of Smyrna (see map of Turkey, ref. 5-D). It presents a magnificent appearance as seen from the water, spreading along the bay and up the slope of Mt. Pagus. A fine quay over 3 miles in length, along which the tramway runs, lines the shore, and in front is a spacious and sheltered harbor. Were it not for the hundreds of camels constantly traversing the quay, Smyrna with its modern edifices would be taken at first glance for a city of Western Europe. It still justifies its poetical names of Crown of Ionia, Eye of Anatolia, Pearl of the East. The slow deposits of the river Hermus and the quantities of rubbish thrown into the water threaten its existence as a port.

Its origin is lost in myths. According to tradition, Tantalus, about 1500 B. C., was its founder. Its name is said to be derived from Smyrne, the Amazon, the wife of Theseus. Colonized by the Greeks soon after the Trojan war, it was constantly fought over by the Æolians and the Ionians, and ultimately remained in the possession of the latter. Taken and dismantled by Alyattes, King of Sardis (628 B. C.), it was rebuilt according to the order of Alexander the Great by Antigonus and Lysimachus. It rapidly developed, and has since that time been the chief commercial city of Asia Minor. Here was one of the Apocalyptic churches. Captured by the Seljuk pirate Tzachas (1080), Smyrna suffered greatly, but was soon retaken by the Greeks. The Seljuk prince of Aidin conquered it (1313), but a crusading fleet drove out the Moslems. The Roman Catholic faith was introduced in 1346, and the city has contained ever since many members of that communion. Tamerlane, after defeating Bayezid I. at Angora (1401), filled up the port, carried the place by storm and butchered the inhabitants. Since 1424, when it was conquered by Murad II., it has remained in the undisturbed possession of the Ottomans save that it was sacked by the Venetians in 1473. The site of the city, though always near the bay, has changed many times. Smyrna has often suffered from earthquakes, notably in 177 (after which it was rebuilt by Marcus Aurelius), 1688, 1778, and 1880; and from plague, as in 1812 and 1837.

The streets run generally parallel with or at right angles to the shore. The houses are built of wooden beams encased in stone, as safer in fire and earthquake. There are several free hospitals, each prominent nationality having its own, and numerous churches of the leading Christian faiths, as well as a synagogue and several mosques. The schools are excellent, especially those maintained by the Roman Catholic and Protestant missionaries. Educational advantages are nowhere greater in the Ottoman empire. Six newspapers are published. Smyrna is the western terminus of the great inland commercial routes and of two railways that run eastward into the interior of Asia Minor. It is the chief mart for European commerce in Anatolia. The principal imports are sugar, coffee, cotton, silk and woolen goods, worked leather, nails, machinery, earthenware, building-stone, lumber, cordage, etc.; the exports, dried fruits, raw silk and cotton, opium, wheat, rice, valonia, oil, sesame, goatskins, carpets, wax, emery, cheese, beans, bones, mohair, etc. The exports average about \$20,000,000 annually in value, and the imports about \$15,000,000.

Smyrna possesses some remarkable ruins, as the Genoese castle on the summit of Mt. Pagus, the theater lower down, the stadium and scant remains of the temple of Diana. Pop. (estimated 1893) 225,000, of which about half are Greeks, the rest being Turks, Armenians, Europeans, and Jews. The Levantines, offspring of marriages between Europeans and natives, are numerous. E. A. GROSVENOR.

Smyrna: town; Kent co., Del.; on Duck creek, and the Phila., Wil. and Balt. Railroad; 36 miles S. W. of Wilmington, 60 miles S. of Philadelphia (for location, see map of Delaware, ref. 4-N). It is in an agricultural and fruit-growing region; is engaged in ship-building and the manufacture of agricultural implements, fruit-baskets, sashes, doors, and other articles; and contains a public high school, two national banks, and a weekly paper. Pop. (1880) 2,423; (1890) 2,455.

Smyth, CHARLES PIAZZI, LL. D.: son of Admiral W. H. Smyth; astronomer; b. in Naples in 1819; was employed for some time under Sir T. Maclear in the observatory of the Cape of Good Hope; was appointed royal astronomer for Scotland in 1845, which position he resigned in 1868; made a valuable series of observations from the Peak of Teneriffe 1856; published *Teneriffe, an Astronomer's Experiment, or Specialties of a Residence above the Clouds* (1858); in 1859 visited the Russian observatories (see his *Three Cities in Russia*, 2 vols., 1862), and made a thorough examination of the Great Pyramid of Egypt, which he considers to have been built under divine inspiration as a standard of a system of weights and measures. This theory is set forth and defended in three works—*Our Inheritance in the Great Pyramid* (1864), *Life and Work at the Great Pyramid* (3 vols., 1867), and *Antiquity of Intellectual Man* (1868). He composed a comprehensive star catalogue and ephemeris of selected observations of the same stars, published in the Edinburgh Observatory's publications (1877-86).

Smyth, EGBERT COFFIN, D. D.: educator; son of Rev. William Smyth (1797-1868), Professor of Mathematics at Bowdoin College; b. at Brunswick, Me., Aug. 24, 1829; graduated at Bowdoin College 1848, and at Bangor Theological Seminary 1853. In 1854 he was made Professor of Rhetoric and Oratory in Bowdoin College; in 1856 he succeeded Rev. Dr. Roswell D. Hitchcock as Professor of Natural and Revealed Religion in the same institution; and in 1863 was appointed Professor of Ecclesiastical History in Andover Theological Seminary. Since 1878 he has been president of the faculty there. He is one of the board of trustees of Bowdoin College, and was for a number of years a member of the prudential committee of the American Board of Commissioners for Foreign Missions. He translated (with Prof. W. L. Ropes) Uhlhorn's *Conflict of Christianity with Heathenism* (1879), has published many addresses, sermons, and scholarly articles, and was one of the founders and editors of *The Andover Review*. Revised by G. P. FISHER.

Smyth, HERBERT WEIR: Greek scholar; b. at Wilmington, Del., Aug. 8, 1857; A. B., Harvard, 1878; Ph. D., Göttingen, 1884; instructor in Williams College 1883-85; in Johns Hopkins University 1885-88; appointed Professor of Greek in Bryn Mawr College 1888; secretary of American Philological Association. He has published *Der Diphthong EI im Griech.* (1884); *Sounds and Inflections of the Greek Dialects*, vol. i., *Ionian* (1894); and various papers on philological subjects in *The American Journal of Philology*, *Transactions of the American Philological Association*, and *The Classical Review*. C. H. THURBER.

Smyth, JOHN: clergyman; b. in England about 1552; graduated at Cambridge 1575; became a fellow; took orders in the Church of England; was reprov'd by the heads of the university in 1586 for having advocated a Judaic observance of Sunday, but persisted in his teachings; connected himself with the Puritans; was minister at Gainsborough to a congregation with which he emigrated to Amsterdam in 1606; was converted to Baptist principles by Mennonite theologians; caused an Anabaptist separation among the Puritan refugees in Holland, and maintained controversies with Ainsworth, Robinson, and others. D. at Amsterdam in Aug., 1612. He was the author of *A True Description of the Visible Church* (1589); *The Difference of the Churches of the Separation* (1608); *Parallels, Censures, Observations*, etc. (1609); *The Character of the Beast*, etc. (1609); and a *Declaration of the Faith of the English People remaining at Amsterdam* (1611), etc.

Revised by W. H. WHITSITT.

Smyth, NEWMAN, D. D.: brother of Egbert Coffin Smyth; b. at Brunswick, Me., June 25, 1843; graduated at Bowdoin College 1863, and at Andover Seminary 1867; was acting pastor in Providence, R. I., 1868; was in Europe 1868-69; was pastor of the First Congregational church in Bangor, Me., 1870-75, of the First Presbyterian church in Quincy, Ill., 1876-82, and in 1882 became pastor of the First church (Congregational) in New Haven, Conn. He was assistant teacher in the Naval Academy in Newport immediately after his graduation, and was first lieutenant of the Sixteenth Regiment of Maine Volunteers in the last year of the civil war. He has published *The Religious Feeling* (1877); *Our Faiths in New Light* (1877; revised ed. 1887); *The Orthodox Theology of To-day* (1881); *Doerner on the Future* (1883); *The Reality of Faith* (1884)—a series of sermons; *Personal Creeds*, etc. (1890); *Christian Ethics* (1892); and various articles in reviews. Revised by G. P. FISHER.

Smyth, William Henry: sailor and hydrographer; b. at Westminster, England, Jan. 21, 1789; entered the navy in 1804; made surveys of Smyth, the shores of the Adriatic, and Sicily; became rear-admiral in 1833 and hydrographer to the admiralty in 1837. Author of *The Mediterranean* (1854). D. near Aylesbury, England, Sept. 5, 1865.

Snail (O. Eng. *snigel*; Lat. *snigall*; Ital. *sterni*; *schnecke*; cf. Germ. *schnecke*, snail < *sneton*, *snoup*, *snaw*): a name given to the terrestrial shell-bearing gastropod molluscs generally, and frequently extended to the similar forms inhabiting the waters. The terrestrial snails are divided into three subgenera—viz.: (1) *Pulmonata* (q. v.), including the terrestrial forms as well as allied forms living in the water, and also the slug; (2) *orbiculi* (pneumogone forms of *orbiculidae*, *orbiculidae*, etc.) which are closely allied to the aquatic *orbiculidae*; and (3) other *orbiculidae* (q. v.) (*orbiculidae*, *orbiculidae*, etc.) which are representatives of another group, the *orbiculidae*. It is thus seen that the form of the shell and even the presence or absence of a shell are of very inferior systematic significance, and entirely subservient to differences in structure of the animal. These differences are chiefly exhibited by the modification of the nervous system, the heart, the distribution of the visceral ridges, and the organs of generation. See, further, *GASTROPODA*. Revised by J. S. KINGSLEY.

Snake-bird: See *DAVIDIA*.

Snake-bites: See *POISONS OF SERPENTS*.

Snake-eels: marine eels constituting the genus *Ophichthus*, allied to the common eel, but found only in warm latitudes. They are remarkable for the absence of the caudal fin, the end of the tail being much like that of a snake.

Snakefish: a name given on some parts of the English coast to the *Ophichthus ruber*, otherwise called *Rasbora* (q. v.), and in parts of the West Indies and Bermuda to the *Nemadus* (or *Sauron*) *bonasus*.

Snake Indians: See *SINIBHUTAN INDIANS*.

Snake Plains: a region in Idaho through which Snake river flows in a deep canon, crossed by successive eruptions of basaltic lava which came from fissures and deluged an area of less than 250,000 sq. miles, including parts of Oregon and Washington. In Idaho the lava occurs in horizontal sheets resting on older volcanic rocks, and the streams from the mountains flow beneath it, forming "hot rivers." I. C. R.

Snake River: a river which rises in the high mountains of Western Wyoming, N. of Yellowstone Lake, in two main branches, known as the North and South Forks, flows westward across Idaho, and then northward, forming the boundary between Idaho and Oregon for 200 miles, and the boundary between Idaho and Washington for 30 miles. It then turns westward and joins the Columbia in Washington near Pasco. Its length is between 800 and 1,000 miles. At the junction of the North and South Forks the elevation is 4,000 feet, and at its union with the Columbia 340 feet. Throughout a large part of its course it is a rapid stream, flowing in canyons from 1,000 to 3,000 feet deep, and is interrupted by magnificent waterfalls. From the Idaho-Washington boundary to its mouth it has been navigated by small steamers. It flows through an arid region, the drainage of which has been rejuvenated on account of vast overflows of volcanic rock and probably also by reason of recent elevations, and the gorge it has cut is still narrow and steep-sided. Its tributaries also flow in canyons, making traveling near its course difficult. ISAAC C. RUSSELL.

Snakeroot: any one of many plants believed to be efficacious in the cure of snake-bites. In the U. S. the name is applied to the following among others: (1) The black snake-root or snake (*Ambrosia artemisiifolia*), a common umbelliferous plant, with a root of an aromatic taste, of some value as an antispasmodic. (2) *Eryngium yuccifolium*, hogsnake-root, or rattlesnake-master, is diaphoretic and expectorant. (3) The *Senecio* *snakeroot* (see *SENECIO*). (4) *Asclepias syriaca*. (5) *L. aquarum*, and (6) *L. scariosa*, called also bottom-snake-root, blasing-star, rattlesnake-master, etc., shows composite-flowered plants, with stimulant and diuretic properties. (7) *Eupatorium asperifolium*, common in the Northern States and a good tonic, is called white snake-root. (8) *Asclepias tuberosa*, the well-known Virginia snake-root, has valuable stimulant and tonic powers and a pleasant fragrance. (9) *A. reticulata* of the Southwest has properties similar to those of Virginia snake-root, and pro-

duces much of the snake-root of commerce. (10) *Chamaejasme racemosa*, or black snake-root, is a valuable sedative and expectorant. (11) *Asclepias tuberosa*, or wild pogon, is called snake-root and Canada snake-root in New England. It is fragrant, with properties much like those of *Asclepias tuberosa*, but is much more pungent.

Snakes: See *SERPENTS*.

Snakeskin: a small piece of skins bone, or other substance which is placed upon the bite of a poisonous serpent for the purpose of absorbing or drawing away the poison. The vulgar in almost all countries have faith in this and other like means of cure, such as the application of a stone to the bite of a rattlesnake. In India, snakeskins are often used, and there are several apparently well-justified instances of their soothing efficacy. It is possible that some of these stones may have a strong absorptive power for the snake poison, for they are often porous, and the unlimited faith which the bitten persons have in this means used for cure is doubtless a powerful sedative.

Snake-wood: the name of a number of trees (see *Lagerstrœmia*); also of the real and wood of *Strophium salignum* and *R. muscivora*, obtained as a remedy for snake bites.

Snaptogon: any plant of the genus *Antirrhinum*, family *Scrophulariaceae*. The snapdragons are annuals and perennials, and many fine flowering varieties are cultivated, mostly belonging to *A. majus* and *A. nemorosum*. Old World plants of easy culture. L. H. B.

Snapper: any one of several fishes of the family *Lutjanidae*. The species inhabit warm seas; they are voracious, with short histories and few pyloric organs; numerous teeth and canines, no incisors or molars, and a continuous dorsal fin. The red snapper (*Lutjanus syn*), common on the Gulf coast of the U. S. in deep water, is an important food-fish. The mangrove snapper, or grey snapper (*L. griseus*), ranges from the West Indies N. to New Jersey, and is especially abundant along shore among mangroves. The name is improperly applied to the rosefish (*Schelus marinus*), the bluefish, and several other fishes. See *FISHES*.

Snapping Turtle: in the U. S., any one of several species of turtles. (1) The common snapping turtle of the Northern and most of the Southern States is the *Chelydra serpentina*. This has the head moderately large, and covered with a soft skin, and the marginal scales of the shell are in a single row. It is said that it sometimes (though very rarely) attains a length of about 4 feet and a weight of 50 lb. It is found from Canada southward, and from the Atlantic seaboard westward to the plains. (2) A species which in some parts of the Southern States at least replaces the *Chelydra serpentina* is the *Macrochelys lacertina*. This animal has the head very large and broadly triangular, and it is covered with numerous horny plates; the marginal scales of the shell are in two rows. It reaches a very large size, sometimes weighing as much as 100 lb. It is confined to the Southern States, extending from Florida to Western Texas, and northward up to Missouri. It is perhaps more generally known as the alligator snapper. Both of these species belong to the family *Chelydridae*, and are distinguishable from all the other turtles of the U. S. by the long and imperfectly retractile neck and tail, and the cruciform plastron or lower shell. Their popular name is due to the habit of snapping at food or enemies. Their bite is severe, and it is difficult to relax their hold. They are by many esteemed for food, especially for making soup. They have a rather strong musky odor. In the early summer they lay from twenty to forty eggs in a hole dug by themselves. (3) In some sections of the U. S. the name is also applied to the soft-shell turtles, or *Trionyxidae*, which snap abruptly at food or other objects. Revised by P. A. LORAN.

Sneezewood: the beautiful and durable timber of the *Phoradendron vitis* (family *Sapotaceae*), a tree of South Africa. When sawing or rasping it, joiners are much troubled by the sneezing which its fine dust provokes. Its wood is very inflammable, even when green.

Sneezing, or Sternutation [from Lat. *sternutare*, intensive of *sternere*, *sternulum*, *sternum*; cf. Gr. *sternōn*, *sternon*]; a convulsive movement by which the lungs and chest-walls are expanded and then suddenly contracted, forcing the breath out violently through the nose. It is produced by reflex action, there being some irritation of the pituitary membrane of the nose which originates the action. The sneezing tends to remove the irritating substance from the nose. There are a large number of irritating substances

whose presence in the nostrils will induce sneezing. When it is a symptom of cold, it indicates that catarrhal inflammation has induced a state of things similar to that produced by a foreign substance in the nose. In children measles may begin with this symptom, and influenza is also frequently so initiated. Revised by W. PEPPER.

Snell, WILLEBRORD (also known as **SNELLIUS**): astronomer and mathematician; b. at Leyden in 1591; succeeded his father as Professor of Mathematics at the University of Leyden in 1613. He discovered the law of the refraction of light. (See **OPTRICS**.) He was also the first to calculate the size of the earth by means of a trigonometrical measurement of an arc of a meridian. The method of proceeding which he employed in this undertaking he described in his *Eratosthenes Batavus, sive de Terræ Ambitus vera Quantitate* (Leyden, 1617). He also wrote *Cyclometria, sive de circuli dimensione* (Leyden, 1621), and other works. D. at Leyden, Oct. 30, 1626.

Snera: See **MOGADOR**.

Snider Rifle (so called from its inventor): a rifle, the essential features of which are that the breech-block revolves around an axis on the right of and parallel to the axis of the bore, and the firing-pin passes obliquely from the nose of the hammer through the breech-block to the center of the base of the cartridge. This was the first form of breech-loader adopted by the British Government, which in 1866 directed that the old Enfield muzzle-loaders should be altered to breech-loaders upon this system. See **SMALL-ARMS**.

Snipe [M. Eng. *snipe*: Dutch, *snep*, *snip*: Germ. *schneipe*, snipe: Swed. *snäppa*, sandpiper]: any bird of the family *Scolopacidae*, which includes those known as shore-birds or sandpipers. (See **SANDPIPER**.) More commonly the name is restricted to the marsh-haunting species of the genus *Gallinago*, about twenty in number, which are distributed over the greater part of the globe, but more particularly in temperate regions. They have a straight bill, considerably longer than the head, grooved to the end, which is slightly expanded, well supplied with nerves and used in probing the mud for worms. The eye is placed far back, over the ear. The plumage is streaked with shades of buff and brown, black and white, and blends completely with the ground. The tail-feathers vary from twelve to twenty-six. The American snipe (*Gallinago delicata*) is found in suitable places over the greater part of the U. S., breeding in the northern portions and thence northward. In winter it migrates, occurring as far S. as Brazil. It is sometimes called English snipe; but that bird, although very similar, is a distinct species (*Gallinago gallinago*), which does not reach North America, although occasionally found in Greenland. The jack-snipe of Europe (*G. gallinula*) is the smallest of the group; the great snipe of eastern South America (*G. gigantea*) is the largest. F. A. LUCAS.

Snipefish: another name of the **BELLOWS-FISH** (q. v.).

Snoho'mish: city; capital of Snohomish co., Wash.; on the Snohomish river, and the Everett and Monte Cristo, the Gt. North., and the Seattle, Lake Shore and East. railways; 9 miles from Puget Sound; 38 miles N. N. E. of Seattle (for location, see map of Washington, ref. 3-D). It is in an agricultural, mining, and lumbering region, has regular steam-boat communication with Seattle, and contains a county court-house (cost \$30,000), 3 graded public schools, 5 churches, about 20 sawmills and shingle-mills, 2 sash and door factories, Masonic and Odd Fellows' halls, water-works, electric lights, street-railways, 2 national banks with combined capital of \$100,000, and 2 tri-weekly and 3 weekly newspapers. Pop. (1880) 149; (1890) 1,993; (1894) State census, 3,250. EDITOR OF "EYE."

Snolksky, snoil'skéé, KARL JOHAN GUSTAF, Count (Sten Tröst): poet; b. in Stockholm, Sweden, Sept. 8, 1841. He made his first appearance in print, with several other young poets, in the publication of the Upsala society *Namnlösa sällskapet* (1860). His earliest collection of poems, *Smådikter* (1861), is characterized by great warmth and originality, especially in the descriptions of Italian life and scenery. His sonnets (1871) and his translation of Goethe's ballads (1876) are among the best of their kind in recent Swedish literature. His later poems, *Nye dikter*, etc. (1881), are more national in spirit, and display a deep sympathy for the unfortunate and oppressed classes of society. For a number of years he has served with distinction in the Swedish diplomatic corps. See C. D. af Wirsén, *Om Karl Snolkskys skaldskap i Svea* (1882). D. K. DODGE.

Snorri Stur'luson [usually written **SNOORRE STURLASON**]: the most celebrated historian of old Iceland. He was born in 1178, and belonged to the numerous and powerful clan of the Sturlungs. He was fostered by the prominent chief Jon Loptson, at whose home he acquired the book-knowledge of his day, and he became particularly familiar with the old poetry and saga literature of Iceland and Norway. At the age of twenty Snorre married a wealthy woman, and by this marriage he became one of the most powerful chiefs of Iceland and was able to attend the Althing at the head of about 900 armed men. He was made speaker of laws (*lög-sögumaðr*) several times, and for several years he was the richest and most influential man in the whole land. He became involved in the bloody feuds which in his time split the Sturlungs into warring factions, and he was continually implicated in litigation with his relatives and others in regard to property and inheritances. In 1218 he made his first visit to Norway, and was received into the household of the young king, Hakon Hakonson. In 1219 he visited the lagman Eskil in Sweden, and there he must have obtained that thorough knowledge of Sweden and Swedish affairs which appears in his writing. In 1220 he returned to Iceland, after having previously promised to work for the subjugation of Iceland to Norway. As he made no progress in the realization of this plan, he was suspected of faithlessness by the rulers of Norway, and his enemies in Iceland took advantage of this circumstance to bring about his ruin. After endless feuds in his own country, Snorre had to go a second time to Norway in 1237, but he lost the good will of King Hakon and was compelled to return to Iceland. On his arrival there he got into trouble with his son-in-law, Gissur Thorvaldson, who, at the instigation of King Hakon, murdered him on Sept. 22, 1241, at his home at Reykholt, where ruins of his splendid mansion are still to be seen. Snorre became Iceland's most distinguished sagaman, and he enjoys some reputation as a skald. As a writer of history he ranks with Herodotus or Thucydides. His *Heimskringla*, embracing an elaborate history of the kings of Norway to the death of Magnus Erlingson in 1177, is famous throughout the world. An English translation of this work was published by Samuel Laing in London in 1844, and a revision of Laing's translation by Rasmus B. Anderson appeared in London and New York in 1889. The *Younger Edda* also bears Snorre's name, and is to a great extent his work. See **EDDA** and **ICELANDIC LITERATURE**.

RASMUS B. ANDERSON.

Snow [O. Eng. *snaw*: O. H. Germ. *snēo* (> Mod. Germ. *schnee*): Goth. *snaiws*; cf. Lith. *snēgas*: Russ. *sniegū*: Ir. *snéachd*: Lat. *nix*, *nivis*: Gr. *νίφα* (acc.) < Ind.-Eur. *sneghos*: *sneghos*: snow]: the aggregations of minute spicules of ice into which the excess of vapor in the atmosphere is condensed when the temperature is at or below the freezing-point of water. These aggregations, called snowflakes, though assuming a great variety of crystalline forms, usually present the outline of a hexagon or a six-pointed star. (See the illustration in the article **ICE**.) In high and middle latitudes the ground is covered with snow each winter, but within the tropical regions no snow falls at or near the level of the sea, for the temperature of the lower atmosphere is always sufficient to melt it, even if it is formed in the upper air. In the northern hemisphere the limit of the fall of snow at the sea-level is an irregular line passing mainly between 25° and 40° N. lat.; in the southern it is more regular, lying in the continents between lats. 37° and 38°. In general, this line is nearest to the equator in the regions most exposed in winter to the polar winds, as on the eastern coast of Asia and of North America. As the heat of the air decreases upward, the formation of snow is always possible upon high mountains, even under the equator. At the summit of the Andes and the Himalayas, for example, the moisture condensed during the rainy season falls in the form of snow, while it rains on the slopes and plains below. Thus in all latitudes from the equator to the poles the tops of high mountains are covered with a layer of permanent snow, which the summer heat is not sufficient to melt. The lower limit of perpetual snow, called the *snow-line*, varies in altitude in the different portions of the globe. Within the tropics it is found about 3 miles above the level of the sea; in temperate latitudes it descends to a little less than 2 miles; and at the northern limits of the continents it is about half a mile, or even less, above the level of the sea; while on the arctic islands vast fields of snow remain permanently very near the seashore.

The height of the snow-line, as observed in different latitudes, is given in the following table:

Latitude.	Alt. Where.	Feet.
50° N.	North Greenland.	5,500
45°	Umanak.	5,500
40°	St. John's, N.Y.	5,500
35°	Rocky Mountains.	10,000

Snyff: See TOBACCO.

Snyders, FRANS: painter; b. at Antwerp, 1579. He was a pupil of Peter Breughel, the younger, and afterward of Hendrik van Balen. He became a friend of Rubens. He began by painting still life only, but when he returned to his native city in 1609 after a visit to Italy, he began to produce pictures of the chase, in which he depicted the struggles of eager hounds with savage beasts at bay, introducing the human figure also. Rubens, whom he followed, sometimes made use of his services as an assistant. Snyders is celebrated as a fruit-painter. The Louvre possesses a *Concert of Cats* by him, and the gallery of the Prado at Madrid has many pictures of his, as also the National Gallery in London and the galleries of St. Petersburg, Antwerp, Munich, Dresden, Brussels, and other European cities. D. at Antwerp, Aug. 19, 1657. W. J. STILLMAN.

Soane, Sir JOHN, F. R. S.: originally called SWAN; architect; b. at Reading, England, Sept. 10, 1753; son of a bricklayer; was sent to Italy for three years (1777-80) as a traveling student at the cost of the Royal Academy; appointed architect to the Bank of England 1788; executed plans for the country-seats of many of the opulent gentry, a volume of which was printed in 1788; became clerk of the works to St. James's Palace and the houses of Parliament 1791, and Professor of Architecture at the Royal Academy 1806; published a volume of his plans of *Public and Private Buildings* (1828) and a *Description* (1827) of his own house and museum in Lincoln's Inn Fields, where he died Jan. 20, 1837. This house, with its art and antiquarian museum, he bequeathed to the nation. Among its treasures are pictures by Hogarth, Reynolds, and Turner, and models by Flaxman.

Soap [M. Eng. *sape* < O. Eng. *sāpe*; Germ. *seife* < Teuton. **saipjō*, whence Lat. *sāpō* > Fr. *savon*; Ital. *sapone*]: any salt of the fatty acids with a metallic base, usually a soda or a potash. All the true OILS and FATS (qq. v.) are decomposed by the alkaline hydrates, by certain metallic oxides, and also by acids, high steam, and hot water. In the decomposition of fats by alkalies the products formed are glycerin and the alkali salts of the fatty acids which were contained in the fats. This process is known as *saponification*. As a rule, soaps produced from soda are *hard soaps*, while those produced from potash are *soft soaps*. Castor oil, however, forms with potash a hard and brittle soap. A fundamental distinction between the hard and soft soaps is found also in the fact that in the former the glycerin is removed in the mother liquor or spent lye, while in the latter it remains mingled with the semi-fluid mass. Moreover, it is not possible to dry the potash soaps, owing to the very hygroscopic character of the base, while soda soaps may be so completely dried as to admit of grinding to powder.

Saponification takes place slowly in the cold, much more quickly by aid of heat, and the presence or absence of air is immaterial. The result depends on the nature of the fat or oil as well as on the base; e. g. if the fat is complex—containing, for example, stearin, palmitin, olein, etc.—then as many new salts are formed as there are fatty acids to combine with the base.

In the production of soap by the action of caustic potash on stearin (glyceryl stearate) the products are glycerin and potassium stearate; thus:

Formerly in North America and Russia much larger quantities of potash were obtained in clearing up forests than now, and hence potash soaps were produced in proportionate quantity. These were, especially in Germany, converted into hard or soda soaps by utilizing the property of the potassium-salts in decomposing common salt or sodium sulphate, forming potassium chloride or sulphate and soda soap. Moreover, the enormous production of caustic soda at a cheap rate consequent on the adoption of Leblanc's soda-process, stimulated by the great demand for bleaching-powders, of which sodium salts are a by-product, has well-nigh put an end to the use of potash in producing soap, excepting as an element of domestic economy in those regions where potash is still a common product. Thus in Canada and in some other parts of North America "pot-ashes" and "pearlashes" are still articles of considerable importance.

As a technical art, soap-boiling depends on the use of caustic lyes of a suitable strength for the saponification of fats, oils, and resins. The lye of the soap-boiler is a dilute alkaline liquor prepared by the action of slaked lime (calcium hydrate) on a boiling solution of 3 parts of potassium carbonate in 12 parts of water, or the same quantity of sodium carbonate (soda-ash) in half this quantity of water. "The manufacturer nowadays buys solid caustic soda or potash from the alkali-works. The sodium aluminate obtained by the decomposition of cryolite is used in the U. S. under the name *Nastrona refined saponifier* for soap-manufacturing purposes" (Wagner).

The manufacturer of hard soap, having provided a stock of alkaline liquors (lyes) of various strengths, charges his soap-pan with a quantity of neutral fat or oil, and adds weak liquors of about 1.050° density. Soap-pans are made of iron plates riveted at the joints, and of various sizes, from 10 to 15 feet in diameter and of proportionate depth, set over fire-chambers, or more frequently heated by steam, either in jackets or injected from numerous small holes pierced in pipes introduced into the liquors. They vary in capacity, of course, but many hold from 20 to 30 tons of soap. As the temperature rises and the oil and alkali liquor mingle, a uniform milky emulsion is formed in which neither oily globules nor water are visible on cooling a portion of the fluid. The operator watches for this change, and adds more solution of alkali or water, as the case may require, until the emulsion forms and all alkaline taste has disappeared, using the tongue as a test. Stronger liquors are then added gradually to complete the displacement of the glycerin, which was begun by the weak liquors, and the boiling continues until a strong alkaline taste is detected. The workman then adds more fat or oils, and repeats the use of stronger lyes until gradually the soap-pan is nearly filled, taking care that at the last there shall be no excess of alkali. During this series of operations he often also adds a portion of resin, which by virtue of its constitution undergoes a kind of saponification with alkalies, and adds to the product more than its value in weight and volume. Then comes the next important stage of the soap-boiling operation, in which, by the addition of salt, the emulsion of oils and alkali is decomposed, the salt taking the water and causing the precipitation of the newly formed soap in a curdy or granulated state, floating on the denser spent lyes in which is found the glycerin and salt, but no alkali. This mother liquor, after the separation of the soap is complete, is withdrawn and rejected as having no value. The imperfectly developed soap is subjected a second time to a like series of operations as at first; it is brought by boiling to a homogeneous state, more oils or fats and strong alkaline liquors are added until the whole has a decided alkaline taste, and more salt is then added to cause the separation of the soap from the alkaline solution, and the whole mass is kept boiling for some time until all the fats, etc., are completely saponified. This completes the chemical part of the operation if the soap contains no rosin, and after allowing time for subsiding of the dregs the "curd" is transferred by skimmers to the "frames," where it cools and becomes solid preparatory to cutting up for use. If the soap contains rosin it requires a further treatment before framing—viz., the curds, after removal of the spent liquor and dregs, are melted with more water and boiled by steam or fire or both. A homogeneous compound results, containing an indefinite quantity of water, which is permitted to rest for two or three days, when it separates into a stratum of a definite compound containing about 65 per cent. of fat acids, 6.5 of soda, and 28.5 of water, and resting on a lower stratum of an indefinite compound containing much more water and the dregs or sediments of the operation. This lower stratum, called *nigre*, contains also an excess of alkali, and forms with the addition of fat and salt the staple of another "boil" for more soap. The *nigre* which accumulates with each boil is used as a mottling for clouded soaps, or may otherwise be worked up in subsequent operations. A strong preference at one time existed for mottled soaps, founded on the fact that in such soaps no excess of water could exist. The substances which impart the mottled appearance, being heavier than soap, were held in suspension only in consequence of its thick and pasty condition. It is, however, possible so completely to simulate the appearance of genuine mottled soap, by adding mineral and other colors during the process of hardening to soaps containing much more than the normal quantity of water, that this sign has lost its value, and such mottlings are justly re-

parted as only evidence of impurity from the introduction of lye into the soap. Good hard white soap contains 65% soda, 31.9% soda, 4% water, 32%.

The soaps vary chiefly with the fats or oils from which they are produced, and may be considered as forming two distinct classes—viz., soaps made from vegetable oils and those from animal oils and fats.

A. VEGETABLE HARD SOAPS.—Bourgeois or Castile Soap.—In Southern Europe soap is largely made of olive oil and tallow, with about 20 per cent. of rape-seed oil. This soap is noted for its firmness, freedom from the degraded animal odors found in other soaps, and in general for its excellent qualities. Without the addition of rape-seed oil the soap from olive oil is so hard as to crumble when cut, and is difficult to dissolve in water. This soap has a peculiar mottling—the grains, and not in streaks of color, as in the indications made from animal fats. The best olive-oil soap is made in Spain and Portugal, also in Provence and Als, from oil imported from the olive after the virgin and table oils have been extracted: 100 parts of new and good oil produce 115 parts of finished soap when no rape oil is used, by which the product is reduced to 170 parts or less. The release of olive oil in margarine or palmatin is the reason for the superior quality of the soap it produces. The mottling of the Marseille soap is due to iron, which is sometimes added as sulphate, and is changed to sulphide by the alkaline sulphide present in the soda. By exposure to the oxidizing influence of air the dark stains of ferric sulphide are changed to a reddish color. Dr. Normandy found the foreign castile (or Marseille) soap (sp. gr. = 1.0765) to contain fatty acids, 76.5; soda, 9; water and coloring-matter, 14.5 = 100. The English imitation (sp. gr. = 0.9999) gave fatty acids of pasty consistence, 76.2; soda, 10.5; water with a little coloring-matter, 14.2 = 100.

Common oil Soap.—Marine Soap.—The soap made from the oil of the coconut is remarkable for its extreme hardness, and consequently for the very large amount of water it can hold without becoming soft. It has a disagreeable odor, which is with difficulty removed. The oil requires for its saponification a very strong lye, and is aided by the use of potash. This soap is not easily decomposed by weak saline liquors, and is hence used to wash in salt water, whence its name of marine soap. This quality of carrying a large amount of water has led to the use of coconut-oil soap as a means of mottling weak soda soaps from tallow, etc. Such soap can be made to hold up manganese oxide, ultramarine, etc., in connection with far more water than can be introduced into a genuine castile soap.

Rosin Soap.—Common Yellow Soap.—Rosin boiled with alkaline liquors, whether caustic or carbonated, is converted into a soapy emulsion. It is not a true soap, but from its plastic, waxy nature it is found to be a good vehicle for dissolving true soaps from tallow or other fats. The process of manufacture for rosin soap varies from that of soap from oils or fats alone by the omission of the last boiling. By itself, rosin does not form a hard soap, and unless it is thoroughly treated by strong liquors it leaves on the hands or any surface washed with it a resinous varnish and offensive odor of rosin. It forms, when carefully prepared and cut in excessive quantity, a very serviceable soap, which quickly forms an excellent lather and is very cheap.

Castor-oil soap and palm-oil soap are both soda soaps, although the oil of the castor-bean forms a hard soap with potash, and is remarkable, like the coconut-oil soap, for its large quantity of water which may be combined with it—so much as 50 per cent. The palm oil is saponified like tallow soap; it is used chiefly as an addition to yellow soap, as the unbleached oil has a decided yellow color, and its strong and rather agreeable odor serves to disguise the disagreeable odor of rosin soap, which also acquires in addition a certain transparency, due to the palm oil.

IL TALLOW AND OTHER ANIMAL-FAT SOAPS.—Under the name of tallow and oils is given nearly all that is useful to say of hard soaps from animal fats and oils. The old German hard soap was prepared from crude tallow by lye of ashes or potash, giving an imperfect soap, which in the subsequent boiling is converted into soda soap by salt, which, being at the same time supplied with an excess of alkali, produces a neutral soda soap, and is then boiled down to curd with salt. This art long preceded the knowledge of chemical principles underlying it. The indications of saponification, advancing by all the grades of the process, are so distinct that no thought was entertained at first of working with

weighed quantities. All that was required was to add more lye or more fat, according to appearance, until the proper state had been attained. In all respects the teachings of this empiric experience led to the same result which chemical knowledge has since illustrated and confirmed. The use of crude tallow has been abandoned in favor of purified grease, and the abundance of pure caustic soda renders useless the old methods of leaching ashes for potash lye or of boiling up soda-ash with lime. Experiment shows that 100 lb. of tallow produce 150 to 155 lb. of perfect cold soap, weighed as soon as it cools; if more is obtained it is because water is added.

Grease Soap, or Red Soap.—This soap, resulting from the lime-saponification of animal fats in the stearic and margarine, is an important product wherever the manufacture of stearin candles is carried on. As the glycerin has already been removed, the saponification of the oleic acid is readily effected even by alkaline carbonates. It is also mingled with neutral fats, and saponified by soda-lye of 18° B. A patented process for producing soap from red oil depends on treating the oleic acid in a steam-heated copper while agitated by a steam-turbine with carbonate of soda, etc., in equivalent proportion to the state of fine powder, added in successive portions, with or without rosin, according as a milder soap or a fine toilet-soap is required. The relative proportions of oleic acid, water, and rosin in this soap being adjusted at the beginning, there is no waste lye; the soap is said to come quickly, does not shrink by air-drying, and is in all respects represented as an excellent soap.

Soft Soap.—In domestic economy it is a practice in New England and New York to saponify the drippings of the kitchen, chiefly beef and mutton suet, with the crude potash of commerce in the cold. The following empirical receipt has become traditional for domestic soft soap: Pot. 12 lb., potash, 5 lb.; water, 12 gal. The fat and alkali are placed together in a cask, and the water is added, 3 gal. at a time, boiling hot, once in twenty-four hours, until all is used. The process of saponification sets in soon, but is not completed until after many days, and is hastened by frequent stirring with a strong stick. When saponification is complete all lumps of unaltered fat disappear, the soap has a silky luster when stirred, and the consistency of a jelly, trailing off in slender threads from a stirrer, and is a powerful detergent for all the coarser purposes of the household. Such a soap is obviously an impure potash-fat soap in caustic lye, and not an actual soap; all the glycerin of the fat is of course present also in this crude product. If an attempt is made to purify it by separation of the glycerin and excess of alkaline lye by solution of salt, it results simply in the production of hard soda soap, on principles already explained.

In the manufacture of soft soap by boiling, caustic lyes are made from leached ashes or American potashes, exactly as when soda-lyes are used, and of graded strength, 9°-11° solutions being first used with gentle heat. The fatty bodies used are kitchen drippings, tallow, fish-oil, blubber, rape-seed, and other drying oils. As soon as the complete combination is effected, and the thick fluid falls in strings from the stirrers with a shining appearance and somewhat turbid, the clarification begins with the gradual addition of a stronger lye at regular intervals until the soap passes from its turbid state to a clear, transparent slime. The boiler judges by empirical rules the state of progress toward completion of the saponification. If a drop from the middle of the pan when cooled on a plate of glass remains clear, the soap is complete; a gray margin indicates a want of lye in proportion to its breadth; and if this deficiency is great, the specimen is fluid and slimy. If the proper quantity of lye has been exceeded, the soap is said to be overdone, which is indicated by a gray skin spreading over the whole drop, instead of forming a ring or rim only; the soap is then granular, and when wet easily detached from the glass (effervescent). An excess of water is driven off by evaporation with a brisk fire and heating the froth as it rises with stirrers. As the soap thickens the froth subsides, the soap sinks and becomes darker, white bubbles are borne on the surface overlapping each other, called laminations by the workman; and the noise occasioned by this action has led to the saying, "the soap talks." As some kinds of oil, like that of hemp-seed, impart an esteemed greenish color to soft soap, while other varieties of soap are yellow, the greenish tint is artificially imparted to the yellowish soap by indigo. The detergent power of soft soap is very great, owing largely to its strong alkaline condition, and is hence

much esteemed in scouring wool, coarse linens, and for other like uses in the dyehouse. As it normally retains as inseparable from it the excess of alkali, the free glycerin and other impurities, there is no guaranty, as in the case of hard soaps, for its purity. Hence many methods have been practiced for reducing its cost—as, for example, the so-called bone soap, formed by the addition of the gelatin from ground bones, dissolved or partially decomposed by potash. In another plan hydrochloric acid is used to dissolve out the mineral matter of bones, leaving the gelatin, which, when carefully washed free of acid, is added during saponification to the fat. The soap with bones is called "Liverpool poor man's soap"; it is an open fraud, since gelatin and phosphate of lime can act only as useless diluents of soap. But this fraud is harmless compared with the use of the intestines of animals, skin, sinews, hoofs, hair, decomposed fish, and other animal refuse. Even naphtha, a non-saponifiable oil, and dextrin are sometimes employed in a like manner. Soft soap contains, according to quality, fatty acids, 50 to 40 parts; potash, 9.5 to 11.5 parts; and water, 88.5 to 50.5 parts in 100.

Silicated soaps contain either soluble silica or sand and powdered pumice, fuller's earth, and alumina. These substances act only mechanically as detergents, and may be permitted when a proper reduction in price is allowed. Sand soap, such as is used for scouring floors, contains as much as 75 per cent. of its weight of sand, and the French *savon-ponce* (pumice-soap) has from 20 to 26 per cent. of ground silica or pumice. These comparatively worthless mechanical mixtures have been replaced by soap in which soluble glass, or silicate of sodium, is employed with advantage. This feeble alkaline compound has by itself a considerable detergent power, and when mixed with ordinary soap an article of greatly reduced price and useful for many domestic and manufacturing operations is produced. These silicated soaps are quite strongly alkaline, owing to the nature of the soluble glass; this excessive alkalinity is reduced for some purposes by combining, with the soap, rosin or fatty acids, as in the ordinary process of soap-making. Carbonic-acid and sulphurous-acid gases are likewise passed into the liquid for the purpose of partially neutralizing the excess of alkalinity.

Toilet-soaps are made from very pure and sweet materials—sweet almond oil, beef-marrow, refined sweet lard, saponified without heat and perfumed with various essential oils. Very pure curd soap is also used for the foundation of toilet-soaps, for which purpose the soap is reduced to thin shavings, melted over a water-bath with rose and orange-flower water and common salt—24 lb. of soap, with 4 pints each of rose and orange-flower water, and about half a pound of salt. When cold next day, it is cut in small bits and dried in the shade, again melted down with the same proportion of orange and rose water, strained, cooled, and dried again. The heavy animal odor is thus removed, when it is powdered and left in a clean place exposed to air for some days. After this, it is ready to receive the desired perfume, and may be colored with aniline tints, ultramarine, etc., and moulded in forms for use. *Shaving-cream* is made by beating up lard with once and a half its weight of potash-lye, and perfuming and coloring as desired. *Glycerin soap* is prepared by mixing pure glycerin with a toilet soap, or with the transparent soap produced from its solution in alcohol. It mollifies the skin in cold weather.

Properties of Soap.—Besides its detergent properties every kind of soap in use contains a variable quantity of water, partly in chemical combination; and its power of absorbing water is also very various, being from 7½ per cent. in hard soda soaps to 162 per cent. in soft potash soaps of oleic acid when previously dried by artificial heat. Soap is perfectly soluble in alcohol, as also in hot water, both solutions becoming of the consistency of a jelly on cooling. In this state, mixed with camphor and oil of rosemary, the alcoholic tincture of soap is familiar as opodeldoc, or *linimentum saponis compositum* of the *Pharmacopœia*. Tincture of white soap is readily decomposed by salts of calcium and magnesia, and is familiar to the chemist, when made of normal strength, as the most convenient test for the hardness of natural waters (Clark's test). Potash soap is more soluble in water than soda soap. The sodium stearate is hardly affected when placed in 10 parts of water, while potassium stearate thus treated forms a stiff jelly. Sodium oleate dissolves in 10 parts of water—potassium oleate in 4 parts, and it forms a jelly even with 2 parts. Cold water partially decomposes the alkaline oleates, palmitates, and

stearates (common soap), the neutral salts being resolved into alkali, which dissolves, and the free acid, which precipitates. This explains why in using soap, even with pure water, its transparency is always disturbed, while the alkaline property, and consequent detergent power, of soaps is due to the liberation of a portion of caustic potash or soda, which attacks and removes the grease of foul linen, etc.

The value of soap depends mainly on the amount of dry soap (the real soap or alkaline salt of the fatty acids) in any given specimen. The loss in weight of a given amount of soap cut in thin shavings, when completely desiccated in a drying oven, at 212° F., is hygroscopic water, which should not for best hard white soap exceed 20 per cent., for mottled soap 25 per cent., and for yellow soap 30 per cent. The fat acids vary from 60 to 70 per cent., and the alkalies from 7 to 9 per cent., according to quality. As before mentioned, soaps made from coconut oil contain normally much more water, and in the yellow soaps from 10 to 20 per cent. of the fatty acids are replaced by rosin.

Soap was not known to the ancients. It is first mentioned by Pliny, who refers to it as something used by the Romans for the purpose of beautifying the hair. Geler in the second century states that soap was prepared from various kinds of tallow with potash and lime. It is stated further that soap is used as a medicine, and that by means of it all dirt could be removed from the body and clothes. For more details respecting the manufacture of soap, consult Richardson and Watts, *Chemical Technology*; Mitscherlich's *Chemistry*; Watts, *Dictionary of Chemistry*; Ad. Wurtz, *Dictionnaire de Chim.*; R. S. Cristani's *Soap and Candles*; Dussance's *Manufacture of Soap*; Thorpe, *Dictionary of Applied Chemistry*. Revised by IRA REMSEN.

Soapberry: the fruit of the *Sapindus saponaria* and *S. inequalis*, West Indian trees of the family *Sapindaceæ*. The pulp is a powerful detergent, much stronger than ordinary soap, and the hard shining seed has been exported and used for making buttons, which are very durable. In the southern parts of the U. S. there grows another soapberry-tree, *Sapindus marginatus*, which is sometimes 40 feet high. There are various tropical species which have a fruit with an edible pulp, but the seed is often poisonous. These trees have no practical importance. Revised by L. H. BAILEY.

Soapstone: See STEATITE.

Soapwort: a name sometimes applied in a general way to the plants of the family *Sapindaceæ*, on account of the soapy quality of the fruits of many species. It is also the name for plants of the genus *Saponaria* (family *Caryophyllaceæ*) and other plants of the same family, which are sometimes utilized for their detergent powers. There are in many parts of the world vegetables which are excellent substitutes for soap. In some instances this cleansing power depends upon the principle saponine, found in plants of widely diverse families. In the common soapwort the root and the leaves contain saponine, in consequence of which they often are used for washing. The root has also medicinal properties. Revised by CHARLES E. BESSEY.

Sobieski: See JOHN III., SOBIESKI.

Soccage, or Socage: See TENURE.

Socialism [from Lat. *so'cius*, sharing, associated, (as noun, fellow, partner, companion): a conscious endeavor to substitute organized co-operation for existence in place of the present anarchical competition for existence; or the system of social organization calculated to bring this about. This definition, though it gives, perhaps, adequate expression to the active and practical side of socialism, leaves out of account altogether its theoretical basis. From this point of view socialism is an attempt to lay the foundation of a new science of sociology, which shall enable mankind, by the thorough understanding their past and present, to comprehend, and thus, within limits, to control the movement and development of their own society in the near future. Consequently socialism in its wide sense is not, as is still commonly thought, a mere aspiration for a better state of society, still less only a series of proposals to mitigate the evils arising from the present social arrangements. Modern scientific socialism essays to give an intelligible explanation of the growth of human society, and to show that as each step in the long course of development from the institution of private property, through chattel slavery, serfdom, and wagedom, was inevitable, so the next step from capitalism to socialism is also inevitable. The object which socialists have in view in their propaganda is that this, the final trans-

formation, should be made immediately by an organized, interested, and intelligent people, instead of unconsciously, and therefore haphazardly, by groups of dissatisfied, prejudiced, and ignorant workers. Agitation against the injustice of the present system of production, therefore, is only valuable in so far as it stimulates men and women to appreciate the tendency of the time, and in this way leads them to organize for the attainment of the definite end which the evolution of economic forms has made ready. Whether the great change will be brought about peacefully or forcibly has no bearing upon socialism in itself, but depends upon the stage of development which has been reached in each civilized country, and the attitude which the dominant class may adopt in relation to the demands which the economic situation impels the producing class to make.

The Early Communal System.—All authorities on the early history of our race are agreed that the primitive forms of human society were founded upon communism, or common ownership, alike of the means of production and of the products; the personal relations between the members of these communities being regulated by kinship, and not by property or residence. In these circumstances equality of social condition was the rule within the limit of the gens or tribes (which were supreme in the communal household, their children belonging to their own gens) and though the power of man to produce wealth was then very small, and scarcity or famine was not uncommon, it was impossible in these circumstances for one portion of the little community to be free while another portion was in possession of a superfluity of the necessities of life. Examples of this form of society are still to be found in their pristine condition, as well as in process of disintegration, in many parts of the world. According to scientific theories, the same law applies to human society that has been found in several developments in other portions of inorganic and organic nature. This law, which has been formulated in the philosophic guise of unification, differentiation, and reintegration, may be traced throughout the vegetable and animal kingdoms. First there is the simple organism, then its disintegration in the form of germination or otherwise, and lastly its reorganization in a form similar to the first. In the case of human society in its slow upward progress private property was as the differentiating form, and the early communal society embraced within itself all the possibilities of the future, as the acorn possesses within itself, in suitable surroundings, the potentiality of the oak. With the institution of private property the entire break-up of the communal form and all that this involved became sooner or later inevitable. But during the period of communism all the inventions and discoveries which form the foundation of the modern system of machine production were placed at the disposal of mankind. The domestication of animals, the growth of cereals, the wheel, the potter's wheel and pottery, the loom and sail, weaving, dyeing, the use of the steam-plat, the mining and smelting of metals—each and all of these were in use under communism. The tribes benefited by the increased power to produce wealth thus very slowly advanced; but the very names of the inventors and discoverers are forgotten, and the circumstances in which they lived prevented them from deriving any individual or personal advantage from their superior ingenuity. At the same period of social growth, exchange, in its modern sense, was unknown, and considerable works were carried out in various directions as portions of the organized industry of the tribe communities, those who were engaged in work which would give no immediate return in food or clothing being supplied by the labor of other members of the community.

Slavery and Serfdom.—As the power of man to produce wealth increased further progress in wealth-production was hampered by these communal forms, and by the necessity incumbent upon each member of the tribe to perform his share of the communal duty. When, also, it was discovered that the captives from neighboring tribes could produce by their labor more than was necessary to maintain themselves in health and strength, there was a strong economic reason for keeping these slaves, in the service of the conquering tribe or lordships, or places of butchering them on the spot in reserving their unutilized brawn. (See SLAVERY.) Despite the evil features of slavery thus established it was an inevitable stage in development, and the strongest minds in the period of its economic supremacy could scarcely imagine that any organized human society could continue if slavery ceased; the slaves themselves, though in such cities as

Athens, Carthage, or Rome rarely were numerous than their masters, sincerely thought of achieving their freedom. But with the growth of private property, the break-up of the old ties of kin, the increase of wealth, and the establishment of heredity and residence as the basis of representation in the ancient oligarchies, misallied sometimes democracies, the division into classes and castes took shape, and these class-struggles began to exert which, in one stage or another, have since recorded the history of civilization. At the same time the extension of trade marked the rise of the merchant class on the shores of the Mediterranean and elsewhere, whose full influence was not to be felt until many centuries later.

Rome was speaking in general terms, the last of the great slave-supplied civilizations, and never, since private property was established, did the permanence of any empire seem so completely assured. But slavery became economically unprofitable. The great slave-worked estates in Italy and other countries, which had built up the wealth of the Roman nobles, had fallen into economic decay. Barbarians from without and insurrections from within broke down the fabric of Roman domination, and the second great form of human subordination to the possessors of property was established. Serfdom across a slavery disappeared and the feudal system, with its complementary institutions, manorial and manorial, obtained control over Western Europe. As slavery had become economically unprofitable, so, in turn, serfdom, with the various classes which it required, gradually ceased to afford sufficient outlet to the social and economic forces that invention and the greater knowledge of the planet called into being.

Rise of the Modern Wage-system.—By degrees free individual owners and craftsmen formed the mass of the working population in the European nations which had grown up on the ruins of the Roman empire, although this subordination took place at widely different dates in the various countries. It is from this period that the more direct analysis of modern society from the socialist standpoint begins. Throughout history, side by side with the class-struggles, the ideas of collectivism, derived from the old communal societies, and of complete individualism, the direct outcome of private property, had been in more or less acknowledged conflict. With peasant cultivators in the country and free craftsmen in the cities the individual form of private property received its highest development. At no period can it be said that this personal independence for the producing class was universal in any community; at all times the propertyless retainers, wage-earners, or serflike dependents accompanied the dominant form. But at the end of the feudal period in Great Britain the individual peasants and individual craftsmen were sufficiently numerous to give the tone to the whole industrial system. The man who worked upon the land and the man who worked at his trade were both, in the main, owners of their soil, their tools, their products which they produced for their own use or for that of their neighbors in the immediate locality. Owing to a series of historic and economic causes, these free individual owners and craftsmen were gradually deprived of their private property and independence, and were driven to produce as wage-earners in the employment of others. The only freedom left to the propertyless man was that of selling his power to labor to some one else who paid him for his service, and used him in conjunction with others to produce goods, no longer primarily for use but for exchange. In the whole previous history of mankind production for exchange and profit had been the exception; now it became the rule. The personal relations which, in the main, had dominated over the old civilizations were transformed by degrees into more pecuniary relations, and thenceforth pecuniary considerations became supreme in society.

Characteristics of the Modern Competitive System.—This economic change, though eventually complete, was of course gradual, and at first its effect was not perceived. Instead of individual production, generally for individual use or with a view to the local market, only the surplus coming into exchange after personal wants were satisfied, production itself assumed a social form, and the local market widened into the national and international market. A class had arisen out of the downfall of the feudal system unlike any class which history before had noted. The members of this class were free in the eye of the law, and possessed, nominally at least, full liberty to do what they pleased; but in practice, having no property of any kind, they were compelled to sell the sole possession left to them, the power to labor in their bodies,

to those who were in a position to purchase this their only commodity by the payment of daily or weekly wages. The payment of wages by no means began with the decay of feudalism; that form of remuneration for services rendered has itself a history extending over many centuries. But the difference between the wage-earner who accepted wages from others in the intervals between laboring for himself and the wage-earner for life, between the independent property-owner and the propertyless hind or "hand," is a difference not only of degree but of kind. The former was, on the whole, economically free, however badly he might be paid in mere money; the latter is economically a mere dependent, no matter to what point his wages may temporarily rise. These wage-earners employed by a master who had accumulated capital by commerce, the slave-trade, or piracy, worked together in co-operation in the workshop. They produced, primarily in social combination, articles of social use, for a social purpose, in the shape of exchange. But these workers had no share in the ownership of the raw material, no say in the quantity or quality of the articles produced, no control over the finished product, which belonged to the master. They received in the shape of wages that which represented on the average their cost of subsistence, in accordance with the standard of life of their class, so long as their employer required their services. What then had happened? A great and crucial change had been brought about. The individual form of production had been transformed into a social form of production; but the form of the ownership of the articles thus socially produced, as well as the control over their exchange, remained in the hands of the individual master or employer. Society at this stage—and the process can be traced at various periods in the development of all civilized nations—passed from an economical condition in which production as well as appropriation and exchange were in the main individual, to a condition of society in which production became social, but appropriation and exchange remained at the entire disposal of individuals. This manifestly involves a direct economic antagonism, and that initial antagonism lies at the root of all the antagonisms of the modern system of capitalist and wage-earning production for exchange and profit. Competition now ruled the market. Competition by free, propertyless wage-earners below; competition for increased profit by capitalists and employers above. The latter were driven by the very necessities of their existence to sweep aside the old local restrictive laws of the Middle Age period; and, as they gained strength, they were likewise impelled to substitute their own commercial control in politics for that of the classes which had hitherto been supreme. From this time forward all improvements and inventions went into the hands of the capitalist class and were shared by them, though much against their will, with the landlords.

Such was the course of events in Great Britain, where the economic transformation was soonest effected, the removal of the people from the individual or collective ownership of the soil having first been carried out. Geographical position and the character of the people favored this earlier development in England, but all civilized countries have followed, or are following, along the same road. Not, however, until the end of the eighteenth century, when steam and the great machine industry became the dominant factors in production, was it possible for the owners of the capital and machinery to obtain complete control over the wage-earners, and to marshal the industrial army under their management in disciplined array. With the factory industry, founded on the inventions of Watt, Hargreaves, and others, it may be said that the last great system of human slavery was firmly established, and wherever it has been allowed to flourish unchecked it is unquestionable that the cruelty and physical degradation by which it has been invariably accompanied fully equal, if they do not surpass, in horror the records of the old chattel slavery and serfdom. The British official blue-books show, indeed, that at the end of the eighteenth century and the beginning of the nineteenth, when unrestricted freedom of contract prevailed between the owners of the means of production and the workers, women and children, to say nothing of men, were treated with more entire disregard for common humanity than were slaves or serfs at any time whatever. Similar causes have produced like effects in other countries, and the condition of the working population in the great cities on both sides of the Atlantic, as set forth in official reports, proves that comparatively little has been done to remedy the evils which are inherent in the competitive system of wage-earning. At

the same time the limited market of the Middle Ages has been converted into a universal international market. Even the nations that resorted to the most stringent restrictive tariffs have been unable to extricate themselves from the great market of the world, which capitalism has steadily extended since the discovery of America. Commercial wars have but served to expand the ever-widening circle of international commerce, and the demand for fresh markets to meet the growing output of commodities, due to the increasing power of machinery, has been the means of pushing expeditions into the remotest parts of Asia and Africa. Capitalism, therefore, in pursuing its inevitable course and in working out the law of its being, like the great slave-supported civilizations of antiquity and the feudalism—by no means confined to its European manifestation—which followed, has unconsciously prepared the way for a closer understanding between the inhabitants of this planet than had ever before been possible. The long slow movement of economic development which arises out of the institution of private property is thus approaching its close, and we are on the threshold of the greatest and most crucial transformation that the world has ever seen. To convince the dominant classes in every country that such a transformation is inevitable, while educating and organizing the producing classes, so that they may consciously and intelligently take advantage of the opportunities which they inherit from the long martyrdom of man to the forms of production and exchange—such is the task of the advocates of socialism.

It has been seen that when European society in the Middle Ages changed from the form of production by individual free men for individual use, only the surplus coming into exchange, to the form of production in which groups of wage-earners worked in social organization under employers, all the goods being made for the express purpose of exchange, no similar change was made in the ownership of these products. That remained in the hands of an individual as before, who competed with other individuals, similarly placed in economic control of nominally free workers for the sale of his products. That which distinguishes this capitalist system of production from all previous systems is that it is carried on primarily for profit and exchange. Goods are of no immediate use to those who produce them. They are made to go upon the market under the control of the employer who in order to keep his business going must sell them for cash in competition with others, who likewise sell for cash; and, in practice, he can only hold his place by steadily increasing his turnover. Cheapness being the determining force in the bitter commercial conflict of the markets of the world, each producer or manufacturer is compelled to cut down his cost of production to the lowest point possible in order that he may be able to undersell his rivals and thus enlarge the scope of his trade and therewith his personal profit. So early as the middle of the seventeenth century the great economist Sir William Petty could speak of "the trade of the world" as falling to the seller of the cheapest products. Assuming free competition to exist, this is even more true now than it was then.

Economic Antagonisms under the Modern Industrial System.—What, however, is the law which governs the exchange of commodities under the capitalist system of free competition—commodities being articles of recognized social use in the social conditions of the time, produced primarily for the purpose of profit and exchange? Such exchange is on the average conducted on an equality, and the relative value of commodities so brought forward for exchange is governed by the amount of social labor which it takes to produce them, or which is incorporated in them. It is impossible to tell whether a bushel of wheat is the product of the best or the worst land, or whether a bale of cloth has been made by hand or by the most improved or by inferior machinery. Neither is it possible to establish directly how much social labor is embodied in the articles so brought forward for exchange. This can only be arrived at indirectly, by way of such exchange and through the higgling of the market. But the amount of social labor necessary on the average to produce the two articles exchanged comes behind both parties to the transaction and settles the terms on which business will be done. Any reduction in the average amount of social labor incorporated in either of the commodities will reduce its value to a proportional extent relatively to the other. Gold in present conditions being, when dug from the bowels of the earth, a representative of incorporated social labor value, serves as a medium of exchange

and also as a standard of value for the various commodities; the ups and downs of value due to variations of demand and supply at particular periods are averaged over the whole, and do not disturb the level of exchange on the basis of incorporated social labor.

The free laborers without private property who are obliged to sell their labor-power as a commodity in order to live exchange it on the same basis as other commodities. Its value is regulated by the amount of social labor which, on the average, is necessary to keep the laborers alive on the ordinary standard of life in their trade in the country where they reside. This amount they receive from the employer in the form of money-wages, with which they in turn buy their food, clothing, housing, and the like. So far the exchange is conducted on the principle of all exchange of commodities. But the special commodity which the wage-earner sells—his power to labor, namely—produces in the course of the day or week or month considerably more value than the worth of the wages which he is paid. From this surplus labor-value incorporated in commodities the employer derives his profit, the landlord his rent, the commission-agent his brokerage, the banker his interest, and so on. It is the unpaid labor of the wage-earners—the labor which they give in excess of the value of the wages they receive—that enables the capitalist class and their associates to pile up riches and capital. Although individual capitalists may run risks, there can be no risk for the class as a whole. A profit for them as a class is absolutely certain; but in order to enhance this profit in circumstances where they are pressed by the competition of their fellows, individual capitalists, and not infrequently the whole class, have naturally endeavored to reduce wages, to lengthen hours of labor, to introduce improved machinery, and to turn out as much goods as cheaply as possible, so as to obtain by their superior cheapness (due to the lessened amount of social labor embodied in a given quantity) a larger sale. The wage-earners being obliged, until their combinations are very strong and even afterward, to compete with one another for the sale of their sole commodity, labor-power, which will not keep unless rapidly sold, often accept lower rates of wages because they must do this or starve. The success of the employer seems a necessity of existence to them, and a large employer of labor for profit is often regarded as a public benefactor; but it is manifest that the interests of the wage-earning class and the capitalist class can not by any possibility be in reality identical, though it may be and is to the temporary interest of a particular set of wage-earners that their own individual employer should be successful. Those who are contributing of their vital strength and health in the form of unpaid labor to build up fortunes for others are, of necessity, whether they themselves recognize it or not, in a position of direct class antagonism to those others, however much this antagonism may be disguised or glossed over; but this class antagonism between wage-earners and capitalists or, to use the wider French terms, between proletariat and bourgeoisie, is itself the direct result and the inevitable human expression of the conflict already noted in its earlier and simpler strife between the social form of production and the individual form of appropriation and exchange.

Out of these two initial antagonisms, however, others arise in their turn. The factory industry, for example, and the mining industry, and agriculture carried on upon a large scale with machinery, call for the most thorough organization, and anything in the shape of unpunctuality or dereliction of duty on the part of the employees is severely fined. It is absolutely essential, from the profit-making point of view, that there should be no waste of time in business hours, and that the whole of the plant, mechanical and human, should work on with unvarying regularity, as if the various parts were dovetailed into one another. This perfection of organization and machine-like co-operation has been secured under the capitalist system to a degree which beforehand would have seemed quite impossible, and great works employing thousands of men and women produce from year's end to year's end with scarcely a break. This complete organization in the factory, the workshop, and the like finds its correlative opposite in the utter anarchy of the exchange at the time when competitive capitalism is in full swing. Each factory at that period is concerned solely with its own output, each mine or each farm with its own product; the object of all being to turn out as much as they can upon the market as quickly as possible, with a view to obtaining as large a profit as may be while trade is flourishing.

Norris takes the least account of the proceedings of his neighbor, being too deeply engaged in fighting for his own hand. Thus the complete negation of production in the factory leads to complete anarchy in the exchange. Further, in order to continue his operations successfully, each manufacturer or producer of any kind must convert his finished goods or products into money before he can begin again, credit merely disguising this operation. He can not exchange his products direct for the products of his brother producer, even for the purposes of his own consumption. They must be converted into money first in every case. If the circulation of the commodities be in any way impeded, then it at once appears that there is a difficulty in this way of conducting business—that money can not at once be realized for those goods which have been thus thrown upon the market. Money, in fact, then becomes temporarily a means for hindering exchange instead of for facilitating it, and it is apparent that in such conditions there is a clear antagonism between commodities and gold, or its equivalent in convertible paper. Again, the tendency of modern society to gather the population into great towns having no rural interests has developed another antagonism, as a partial result of those already specified, between town and country. The interests of the two are frequently found to be antagonistic instead of harmonious, and one of the great problems of the future will be to secure or to bring about a co-operative agreement between these two great departments of human life and industry. Moreover, the capitalist system of production has developed an antagonism between the sexes, and even between parents and their children. This antagonism arises, like all the rest, from economic causes. The family, in its ancient sense, has been disrupted, and men are met in the whirl of competition for wages by women who, owing to a variety of causes, compete with them on a lower standard of life for a lower rate of wages. Children, in like manner, are in many countries brought in to compete against men and women. A man's foes in this instance are literally they of his own household; though in this as in other cases the workers themselves do not perceive the mischief which is being done to themselves, and at the same time to the whole community. Of the antagonism between skilled and unskilled labor, between casual, unorganized workers and trade-unionists, between employed and unemployed, it is unnecessary to speak; these struggles are too apparent to all who study the history of society in the nineteenth century.

The Cause of Commercial Crises.—Ever since the capitalist system became the predominant form of production in civilized countries, ups and downs of trade, periods of inflation alternating with periods of depression, have been the rule. So much is this the case that they are taken for granted by men of business, who base their calculations upon such variations, but are seldom able to grasp the causes of them. (See COMMERCIAL CRISES.) These sudden collapses of trade are generally regarded as being as much beyond human control as an eclipse or an earthquake, a tornado or a long frost. They are, nevertheless, indisputably the result of social causes, which, when they are understood, can be regulated and controlled. The most remarkable feature in all the successive catastrophes from 1815 to 1893, before as after the universal use of steam-vessels, railways, and telegraph cables, was that they were preceded and accompanied by an excess of products in every department. In all previous economic epochs, as in barbarous countries at the present time, general depression of trade has arisen from drought or from flood, from bad harvest or from pestilence among men or cattle; in any case from an insufficient supply of necessities. Only among the most civilized peoples does an excess of what the world requires become an immediate cause of stagnation, and the reason why thousands of workers in all countries are prevented from earning their livelihood. At this time the power of man to produce wealth in every department of industry, including agriculture, is far greater than it has ever been before. Hence this enhanced productive capacity seems in some way to have become at intervals a serious hindrance to production and exchange. Whence does this arise? The control of all the great means and instruments of production, the direction of the huge industrial machines, the arrangement of the amount of labor to be devoted to great public works or to the output of commodities, the initiation of fresh enterprises and the adoption of new inventions—all this rests with the capitalist class and the managers whom they employ. When, owing to various causes, a time of good trade begins, all the financiers, employers, manufacturers, mine-owners, and so forth, hasten with one accord

to take advantage of the days of prosperity rendered the brighter by contrast with the previous gloom. The unemployed workers, who are an unfortunate necessity for the due functioning of the capitalist system, are absorbed into activity, the demand for goods from every quarter increases, prices (not values) rise all along the line, great works, such as railways and canals, are again undertaken, huge vessels are laid down in all the ship-building yards, demand in one direction enhances demand in another, wages are paid on an almost unexampled scale, and goods are turned out in greater abundance than ever before. But at the very moment when the expansion is at its height the collapse begins. Suddenly a difficulty arises in disposing of one set of goods for money, a large capitalist has to press his bills or his commodities upon the market in order to realize their value for immediate cash. Others pursue the same course. There is a general rush to sell. The antagonism between gold and commodities is felt in earnest. Prices fall more rapidly than they had risen. Workmen are discharged, factories are shut down or run on short time, furnaces are blown out, shipping-yards are closed, railways are suspended. A crisis has begun; the incapacity of the capitalist class to handle effectively the machinery of modern civilization is proclaimed to the world, and bankruptcy and stagnation at once follow. The social form of production revolts against the individual form of the exchange.

Tendencies toward the Socialization of the Means of Production.—At this point socialism comes in and, having completed its analysis, shows how the antagonisms inherent in the capitalist system must be solved by making exchange social, as production is social; by establishing co-operative production and distribution in the place of competitive wage-labor and competitive capitalism. That which in itself is desirable from the *a priori* point of view, society is even now anarchically and unconsciously working up to. The entire series of differentiations arising out of the establishment of private property having been passed through, the complete reintegration of collectivism or communism on a higher plane is even now in progress, without the vast majority even of intelligent and educated men being in the least aware of it. Socialism is asserting itself in modern society by reason of economic causes, as capitalism owed its predominance before to the action of the same causes.

Thus the capitalist class in all civilized countries have championed competition and unlimited right of free contract between the wage-earners and their employers; but the hideous results of this scramble in the shape of physical degeneration, with accompanying mental and moral degradation, alarmed even the modern state, and laws have been passed to limit the freedom of the masters and servants alike in order to check in some degree this serious deterioration. At the same time, and as if in spite of themselves, modern statesmen, while upholding stoutly the doctrine that everything is best done by private effort, have been impelled to set on foot a number of public services, national and local, whose duties are continually extending in the face of all the protests raised by the older school of economists. Moreover, there is a growing feeling in every civilized nation that the hours of labor as well as the wages of the workers in these public services should no longer be governed by the law of competition for subsistence wages, but that the governments and municipalities should assure to their servants a day's work of no more than reasonable length in proportion to the intensity of their toil, and wages adequate to obtain for them a decent standard of life. This view, though still far removed from socialism, is manifestly a portion of a movement which is leading toward it. The public services are, in short, being transformed in the interests of the workers with the assent of the whole community. In like manner the public health, the improvement of the conditions and surroundings of the workers of the cities in particular, in order to secure to the working population a better physical development and some enjoyment of life—this also has become a matter of general concern to which national laws and state and municipal ordinances give expression. Such measures as these may be reckoned as conscious though small endeavors on the part of society to correct the evils of existing anarchy and to prepare the way for a better system.

Far more important, however, are the unconscious strivings toward the new period. On the one hand, the formation of companies, consisting of many bondholders and shareholders, to carry out great public works, and the transformation of private concerns engaged in all the depart-

ments of production and distribution into similar companies, form a distinct move in the direction of socialization. The individual employer is merged in a multitude of shareholders, and the pecuniary relation becomes the sole and only tie between employers and employed. This company form is manifestly an unconscious step toward socialism, seeing that these great organizations and corporations, whether for production or for distribution, are controlled and directed by managers and boards of directors who, regarding the matter solely from the economic point of view, might as easily be appointed by the workers to carry on the business in the interest of the community and the workers themselves as be nominated in the way they are to-day by shareholders who, in the majority of cases, have no direct knowledge of the affairs from which they derive an income, and perhaps have never been within hundreds or thousands of miles of the place where "their" factories, or mines, or works, or railways, or lands are situated. So soon as this economic possibility is generally recognized the final change has begun; but at the same time that this modification from the individual form into the company form of ownership and appropriation is taking place, the private firms and the companies are alike abandoning competition for co-operation. Banks are being consolidated, nationally and internationally; shipping companies are agreeing not to compete; joint-stock associations form trusts and "rings." In the U. S., where unregulated competition attained perhaps its highest pitch of development, this form of industrial and financial monopoly has unquestionably become more striking than anywhere else. This process is going on in all civilized countries. Moreover, the introduction of improved processes of manufacture, which was formerly hastened by individual anxiety to compete on better terms, is now hindered by the disinclination of monopolists to disturb vested interests with which they are well content. Thus the capitalist system of production no longer favors human progress, but heads back the economic evolution, and brings about periods of recurrent anarchy in every department of industry. Capitalism therefore is making plain the way before the face of socialism by its unconscious but inevitable institution of monopoly. The other human side of this great economic antagonism is likewise unconsciously organizing its forces to capture these monopolies. Throughout the civilized world the workers are beginning to see that whatever be their nationality, whether they are men or women, skilled or unskilled, their true interest lies in the thorough combination of labor with a view to the final overthrow of the wage system. Socialism is accepted only by the minority, but its principles are spreading daily, and ere long it will be universally recognized by the toilers that mere strikes, however well organized, are almost as hopeless a method of struggling against the domination of capital as was the old plan of machine-breaking. The machines were used against the interests of the workers; therefore they, in their ignorance, tried to destroy them, instead of combining to capture them. The great monopolies are in like manner used against the workers; therefore they, in their ignorance, attempt to strike against them, instead of using the political machinery at their command to obtain possession of and manage them. But with national and international organization come also education and full appreciation of the facts of their social surroundings. Then the producers will constitute practically the whole community, can move forward in fraternal solidarity and educated comprehension to take advantage of the economic conditions which have been prepared for them. Each nation must of course follow the route marked out for it by its previous economic history and its geographical position. It seems certain, however, that no matter by what means it may triumph socialism will begin with the public services and the more highly developed company forms, and proceed until production is last organized on the land which has not yet reached the company form in any country.

With the establishment of national and eventually of international socialism, mankind resumes the definite control over the means and instruments of production, and masters them thenceforward for all time instead of being overmastered by them. By such co-operative industry, whose power over nature is increased by each fresh invention and discovery, a carapace of repression is lifted off from the faculties of each individual, and wealth being made as plentiful as water by light wholesome labor, all freely contribute to increase their own happiness as well as that of their fellows. Human nature assumes a new and higher character in a

society in which the surroundings are such that life is not an endless struggle against the pressure of want and the temptations of money. Instead of the personal, limited, introspective individual ethic is the social, altruistic, broad ethic in which the duty toward society necessarily occupies the highest duty toward a man's self. Women, instead of economic and social subjugation, will assume her place as the social equal of man. So far, therefore, from individual initiative and personal freedom in the highest sense being limited and straitened, human beings will have the opportunity for attaining to a level of physical, moral, and mental development such as the world has never seen. The golden age of human society is, indeed, not in the past but in the future.

Such is a statement, obviously abstract and incomplete, of the theories of scientific socialism. There have been various schools of socialism, but the theories above set forth are accepted by the overwhelming majority of socialists in all civilized countries, and the differences which arise are chiefly on points of tactics; though in this respect an exception must be made with regard to Christian socialism who connect their socialist theories with the founder of the Christian Church. The utopian socialism which has striven, and even now attempts, to establish little oases of co-operation amid the existing wilderness of competition and anarchy, is slowly merging itself in the worldwide sweep of scientific collectivism. That such great thinkers and writers, however, as Saint-Simon, Robert Owen, and Fourier should in part have taken this view only shows how difficult it is for the highest minds to grasp the tendency of the facts around them. The time is ripe for the complete analysis of the fully developed economic forms. The anarchists, who sometimes call themselves socialists, are so fearful that universal co-operation and collectivism will crush the freedom of the individual that they not infrequently drift into the advocacy of sheer reaction, and preach the gospel of individual destruction, which is really the creed of individualism run mad. It is needless to say that this revolt against all authority, even that which is voluntarily accepted for the purpose of securing the full advantage of organized industrial co-operation, is in direct opposition to socialism, though often confounded with it. The destruction or transformation of the present government and the abolition of wage-labor, which socialists look forward to as the next stage in the development of human society, will give free outlet to the individual; while the attempt to secure the supremacy of the individual by mere individual effort, if it could be realized and made effective, would but deprive mankind of the vast collective powers of production which are now available. Socialism and anarchy are directly opposed, since as in fact and in fact; their only point of agreement is that each is in antagonism to our present society.

Socialism manifests itself in the shape of an organized, disciplined party chiefly in Germany, where its development since 1870 has been remarkable. In that country the socialist have now a recognized political force, and their action is in the main guided by the views set forth in this article. If they continue to progress in the future at the same rate as in the past, there is every reason to believe that within the next generation they will be the dominant party in the state and thus able to give full expression to their opinions. It is most probable, however, in spite of appearances, that the last of the international socialist movement will be with the English-speaking peoples, whose greater resources, development and superior adaptability in politics, together with their geographical extension, give them opportunities such as the Germans can never possess. In France the movement has advanced since about 1890 with amazing rapidity and the country which was the first to manifest in the world a genuine rising of the modern proletarian will have its full share in molding the great international socialist movement. All through Europe and at length in the U. S. socialism is recognized even by the dominant classes as a coming power. The divorce of human solidarity, of international fraternity, and worldwide co-operation for the benefit of the present and future generations, appeal to the sentimental aspirations of the large number who have little inclination to examine into the scientific theories on which these doctrines are based; who, however, having formed a high opinion of human intelligence, are apt to resent any attempt to demonstrate that socialist schemes have hitherto been little better than mere theories in their social and economic relations. Now, when socialism is translating itself into action in the

direction of palliation of existing evils, and toward international socialist congresses, as well as the promulgation of recognized socialist on public councils and boards, have shown that definite, practical efforts are being made to hasten the attainment of complete emancipation for all, poor and women of all nationalities and of every creed are but to investigate the causes of the class-war which is raging around them in the midst of profound peace, and to believe that socialism furnishes the only possible solution of the conflict.

H. M. HODMAN.

Social War [—*guerra*] is from Lat. *bellum*, pertaining to, generally, or allies, civil, or *bellum*, fellow, comrade, ally; in Roman history, the name applied to the wars (c. 90-80) between Rome and her Italian allies. The latter, who had for nearly two centuries shared the burdens and dangers of the republic, were justly demanded admission to the privilege of the franchise. After the assassination of M. Livius Drusus (91 B. C.), who desired to grant citizenship to the Italians, the allies, including the Marsi, the Peligni, the Lucanians, the Samnites, and many others, rose in arms and proclaimed a new republic. A bloody war followed, and notwithstanding the great victories of Sulla, Marius, Lucius, and others, the Romans were compelled to make many concessions, and in the end the Italian received the franchise, though they did not gain their due share of political influence on account of the restriction that forbade their voting in any but a specified number of tribes. Over 400,000 men are said to have been slain in this war.

Society Islands: a group of islands in the South Pacific Ocean, the principal part of what is officially known as the French establishments in Oceania, which also includes the Marquesas, Tuamotu, Gambier, and Tuluu groups and Rapa island. The Society islands lie between lat. 16° and 18° S. and lon. 145° and 155° W. They consist of one large island, Tahiti (q. v.), and a number of small isles, comprising altogether an area of 665 sq. miles, with 16,000 inhabitants. The islands are mountainous. In the center some of them rise to the height of 6,000 or 7,000 feet, but they all have a belt of low land extending between the foot of the mountains and the sea, and they are generally surrounded by coral reefs. The soil is very fertile and the climate delightful. All tropical fruits grow luxuriantly, and European fruits which have been introduced succeed well. The inhabitants are Polynesians; most of them are Christians. The chief town and port, and capital of the colony, is Papeete. The chief exports are mother-of-pearl, copra, cotton, and vanilla. Sugar and coffee also are produced.

Socinianism and Socinism: the historical designations of the advocates and doctrines of the most thoroughly organized system of anti-Trinitarianism that has ever existed. In the U. S. the names are seldom used, having long since given place to Unitarianism and Unitarianism, names of much wider scope.

I. HISTORY.—The Trinitarian doctrine, as defined in the Nicene and Athanasian creeds (see article GOD), a gradual development of three centuries, was held almost universally after the time of Justinian as a fundamental element of Christianity by the ancient churches, Eastern and Western, and by all the churches springing immediately out of the Reformation. At the era of the Reformation the first anti-Trinitarians were certain individuals who appeared at different points, chiefly among the German Anabaptists. Among these were Martin Colliarius (b. in Stuttgart, 1496, educated at Wittenberg, at first a disciple and resident of Luther, at Basel, 1546), John Denck (d. at Basel, 1529), Lewis Heiser (at first a fellow laborer of Zwingle, executed for polygamy at Constance, 1529), and John Campanus (studied at Wittenberg, and died after long imprisonment at Cleves, 1574). One of them, named Spiritus, supposed by Dr. Howe to have been Adam Pastor, a Prussian Anabaptist,

first carried Unitarian doctrine to Poland in 1546, which afterward became the seat of the denomination. Servetus in 1531 published his first work, *De Trinitatis Erroribus*. In 1532, at Haguenau, he published his *Dialogorum de Trinitate, Libri duo*, and at Vienna, in 1553, his *Christianismi Restitutio*. He was then imprisoned by the Roman Catholics for heresy. Escaping, he went to Geneva, where he was burned as a blasphemer and disturber of the peace. His heresy was neither Arian nor Socinian, but apparently a more consistent assertion of the deity of Christ than that of his enemy, Calvin.

In Italy, where during the preceding century religious faith had been generally superseded among the educated by a semi-pagan humanism, many prominent persons, affected by the religious excitement of the Reformation, adopted rationalistic views. In the second quarter of the sixteenth century, at Vincenza, a small town in the district of Venice, a society existed consisting of persons denying the divinity of Christ and related doctrine. It was dispersed in 1546, previous to which, it is said, Bernard Ochinus and Lælius Socinus joined it. The latter, born in Sienna in 1525, was educated as a lawyer, but devoted his life and great talents to theological speculations. He has been correctly designated "the spiritual father of Socinianism," while his nephew, Faustus Socinus, was "the founder of the sect." He remained ostensibly a member of the Reformed Church at Zurich, although by personal influence, wide correspondence, and extensive journeys disseminating his opinions. He visited Poland in 1551, and again in 1558, and died in Zurich in 1562. His nephew, Faustus Socinus (1539-1604), filled with his uncle's spirit, but with a much more elaborate and consistent system of theology, settled first in Basel, was called into Transylvania to assist Blandrata in his controversy with Francis David, and settled permanently in Poland 1579. After the removal of Spiritus to Poland in 1546, Francis Lismanin, a Corsican monk and confessor of the queen, Bona Sforza, had been converted to Unitarianism in 1551. He was soon re-enforced by Peter Conezius and George Blandrata, a native of Piedmont, who through the influence of Lismanin was appointed physician to the queen. At this time all the Protestant synods held in Poland embraced promiscuously the ministers of all the Reformed societies, whether Lutheran, Calvinistic, or anti-Trinitarian. In 1565 the latter were expelled from communion, and forced to form an independent ecclesiastical organization. The Unitarian Church thus formed comprised persons of very dissimilar opinions. "They all concurred in maintaining the supremacy of the Father, but with respect to Jesus Christ, some thought him to be a God of inferior nature, derived from the Supreme Deity; others held the doctrine of Arius, conceiving him to have been the first created Spirit, who became incarnate with a view to effecting the salvation of mankind; while a third party believed him to be a human being. These last were divided into two classes—the one believing the miraculous conception of Jesus; the other considering him to have been the son of Joseph as well as of Mary." Socinus held that although a man only, he was entitled to divine honors, since his exaltation at the right hand of God and assumption of the government of the Church, while others, pre-eminently Francis David, denied this.

From the advent of Faustus Socinus these various elements were, through his superior genius, wrought into a homogeneous ecclesiastical organization, and brought into substantial agreement with the theological views of his uncle; and ultimately the denomination and system of theology took their historical designation of "Socinian" from these great leaders, but during their earlier history they were called Pinczovians, from Pinczow, the place of their first settlement, and afterward Racovians, from Racow, a town built for them by a Polish nobleman, and their metropolis of learning and influence. They flourished exceedingly for the greater part of a century, converting to their views many of the Polish nobility; they established colleges which attained great reputation, attracting multitudes of Roman Catholic and Protestant youth, and they produced a number of theological speculators and polemics of great learning and ability, whose works attained a vast circulation. In 1563 Blandrata went into Transylvania to attend the prince, John Sigismund II., as a physician, where he succeeded in bringing over to his own opinions Francis David, at that time superintendent of the Reformed churches. These together secured a large following, but the prosperity of the sect was greatly impaired by the bitter

controversy which subsequently arose between Blandrata and David, the former affirming and the latter denying that divine honors are to be paid to Christ. David was condemned by the diet held at Weissenburg in 1579, and died in prison in November following. After a long struggle with their opponents the Socinians were suppressed in Poland in 1658, the centennial of Blandrata's arrival. Those who refused to renounce their opinions went into Transylvania, Hungary, and Prussia, and the majority into Holland, where they were merged with the Mennonites and Low Arminians. Of churches of their order in Transylvania there were 108 in 1887, with nearly 60,000 registered members.

A first catechism was written by George Schoman (d. 1591). Faustus Socinus (d. 1604) left another incomplete. Valentine Schmalz and Jerome Moscorovius produced the *Racovian Catechism*, the standard of the Socinian churches. It appeared in Polish in 1605, and was published in German 1608, and in Latin 1609. An English edition, produced in Amsterdam 1652, was ordered to be burned the same year by the English Parliament. It was again translated and published in English in 1818, with a history of the Polish Socinians by Dr. Thomas Rees. After their expulsion from Poland, Andrew Wissowatius and other learned men, finding refuge in Holland, collected their more important writings and published them in 8 vols. folio, comprising the works of Socinus, Crelius, Schlichtingius, and Wolzogenius; to which a ninth volume has been added, containing the writings of Przypcovius and Andrew Wissowatius, and a tenth volume, containing the works of Brenius. This collection is known as the *Bibliotheca Fratrum Polonorum*.

II. DOCTRINE. 1. *The Scriptures*.—Socinians admit that a supernatural revelation is essential as a means to effect the salvation of men. They regard Christianity as a new law, revealed and executed by Jesus Christ. This revelation is contained in the Scriptures of the Old and New Testaments, and especially in the latter. These are authentic, sufficient, and perspicuous. Yet, as they can contain no elements inconsistent with reason, they are to be interpreted in a sense agreeable to reason; which rule of interpretation in their hands led practically to the conclusion that although containing a divine revelation, and virtually infallible, they contain minor errors.

2. *Theology*.—(1) The divine unity is inconsistent with personal distinctions. (2) Free self-determination is more fundamental in the divine nature than either justice or love. (3) By the act of creating the world, God has voluntarily limited his omnipresence as to his essence, and by creating free agents he has voluntarily limited his power and his knowledge, because free will is self-determined, and future contingent events are not the objects of knowledge. (4) "There is no such justice in God as requires absolutely and inexorably that sin be punished. There is, indeed, a perpetual and constant justice in God, but this is nothing but his moral equity and rectitude, by virtue of which there is no depravity or iniquity in any of his works." (Socinus, *Prælect. Theol.*, c. xvi.) Hence he can pardon any repentant and reforming sinner without a satisfaction to justice. (5) The Holy Ghost is the impersonal power and efficacy of God.

3. *Anthropology*.—The guilt of Adam's sin is not imputed. Man was created naturally mortal, and since the time of Adam has gradually acquired an hereditary tendency to sin, which of itself does not involve guilt. Responsibility is limited by ability. Man, animated by the promises of God, is able to turn unto God; and when he does so turn and believe, God seals his promises more and more on his heart by the Holy Spirit. *Rac. Cat.*, sec. 5, ch. x.

4. *Christology and Soteriology*.—(1) Christ, as to his essential nature, is strictly human, but miraculously generated by the power of the Holy Ghost in the womb of the Virgin. Hence he was from birth without sin. At his baptism he was supernaturally sealed with the Holy Ghost, and qualified and endowed with authority for his office as Prophet, Priest, and King. He was also taken up to heaven and admitted to the vision of God, and instructed in divine things. While on earth he revealed the will of God to his disciples with divine authority. After his death he was raised to the throne of God, endowed with the divine attributes of omniscience, omnipotence, and supreme dominion. He is the rightful object of divine worship and of invocation. He saves his people as Prophet and King, the office of Priest being merged in the other two. He will judge the world at the last day, and raise believers to share in his own glory. (2) As God's justice demands no satisfaction, Christ's death

never as an exhibition of divine love; it subdues obduracy, soothes hopes by soothing God's promises; it was the necessary means to his resurrection, by which he brings life and immortality to light by an evener demonstration.

3. *The Church and Sacraments*.—The Church they defined as the company of those who believe saving doctrine. As to what this doctrine is, they allowed, within the limits of the recognition of the divine mission of Christ, the largest freedom of opinion. Socinus discarded the term "sacrament," and held that the Supper was the only sacred rite which Christ intended to be permanently observed. The authors of the *Roman Catechism* in its final form teach that baptism and the Lord's Supper are the two Christian rites. These they regard as only memorials and symbols and badges of church membership. They pronounce infant baptism an error, but advise its toleration.

In his practical ethics Paulus Socinus was exceedingly humane—opposed to war and capital punishment. The system of Socinus was remarkable for its radical departure from the traditional theology. Even the English Unitarians of the eighteenth century, who were Socinian rather than Arian, were much more cautious and conservative than Socinus, while the early Unitarians in the U. S. were generally Arians, regarding Jesus as a being *in genere*, and only a little less than God.

LITERATURE.—See, as above mentioned, the *Hilbithum Fidei* of Paulus Socinus; Dr. Tauler's *Life of Socinus*; Dr. Thomas Keen's *Roman Catechism, with History of Unitarianism in Poland* (London, 1838); *De Verbo Elohii* of Hieron. Zanchius (1516-51); *Socinianismus Confutatus* (Amsterdam, 1644) of John Hamrick; *Pauline Evangelium* of Dr. John Owen (Oxford, 1655; vol. xii. of Good's Edinburgh edition of Owen's Works); *Hist. Premon. of Christ*, by Dr. J. A. Dornier (Oly., 2 vol. 11); Princip. Cunningham's *Doct. Theol.*, vol. ii.

Revised by JOHN W. CHADWICK.

SOCI'ANS, PAYTOR and LELIUS: See SOCIANS.

Sociology [*Fr. sociologie*; from *Lat. socius*, companion (referred to by *deris. socius*, society) + (*Gr. logos*, discourse); the science or natural philosophy of society. More definitely, sociology is the general and fundamental science of society, which occupies itself with the elements and first principles of social phenomena, and leaves to ethnology, demography, political economy, comparative jurisprudence, the theory of the state, the comparative study of religions, and other special social sciences a detailed investigation of particular groups of social facts, all of which have their ultimate interpretation in the underlying and co-ordinating principles of sociology.

HISTORY OF SOCIOLOGICAL THOUGHT.—To some extent society was studied scientifically and philosophically in ancient times. The *Republic* and the *Laws* of Plato and the *Politics* of Aristotle abound in scientific generalizations. Later, Hobbes, in the *Human Nature* and in the *De Corpore Politico*, entered upon an interpretation of society in terms of its internal forces or motives; and Montesquieu, in *Le Esprit des Loix*, laid the foundations of an interpretation in terms of external conditions or environment. But there was no true science of society until the nineteenth century. Auguste Comte, who coined the word sociology, was the first to put together in one conception all the necessary elements of such a science. Plato and Aristotle had not separated the science from the art of politics nor from ethics. Neither Hobbes nor Montesquieu nor the economists had studied society comprehensively in all its aspects, and, notwithstanding the influence of Hume (to whom, as Huxley has pointed out, Comte was indebted for whatever is scientifically valid in his notions of causation), the explanations of society were still to a great extent theological and metaphysical. Comte insisted that society must be viewed as a whole, indivisible and organic, and he desired to found a science of social phenomena in their co-ordinated entirety. This comprehensive sociology he desired to make positive, basing it on a wide observation of facts and freeing it altogether from theology, metaphysics, the revolutionary spirit, and the art of politics. Comte's conception was incomparably superior to his predecessors. Both together made for a time so little impression upon thought that the very name sociology was well-nigh forgotten when Herbert Spencer took it up, and by making a voluminous treatise on sociology an integral part of his system of *Synthetic Philosophy*, established for both the conception and the name an enduring place in the circle of the sciences.

Spencer had worked out his scheme of thought before he knew anything of Comte's, and his sociology had nothing in common with Comte's beyond the general idea and the name. It is an application of the philosophy of evolution to society. Society, like the material world and the living organism, undergoes integration and differentiation. It passes from homogeneity and indistinctness to heterogeneity and difference of organization. Comte used the term social states in a merely rhetorical way, as a cause for social order, and social dynamics as a means for progress. Spencer uses the terms in the physicist's sense. Social states is an account of social forces in equilibrium, social dynamics an account of disturbing and evolutionary changes. Actually the static and the dynamic tendencies are themselves influenced, and the result in society as in the solar system and in the living body is a moving equilibrium. On the physical side therefore Spencer's explanation of society is more profound and scientific than Comte's. At the same time his conception of society as organic is more definite. Without adopting Hobbes's concept of the Leviathan, he finds in society a division of labor not only among individuals, but among groups and organizations of individuals. There is a sustaining system made up of industrial groups, a distributing system of commercial activities, and a regulating system of political and religious agencies. In working out this analogy, however, Spencer, while avoiding the fancifulness of Hobbes, fails to rise to the thought of Plato, who found in this functional organization of society the basis and the true type of the ethical life, and so prepared the way for the conception of society as a means to the perfection of human personality.

The biological-organic conception of society has been made much of by two later sociologists of distinction, namely, A. Schäffle, in the *Den und Leben des sozialen Körpers* (Tübingen, 1875), and Guillaume de Moiré, in his *Introduction à la Sociologie* (Brussels, 1890-9), and in a less degree by Lester P. Ward in his *Dynamic Sociology* (New York, 1883). All these writers, however, lay especial stress on the physical phenomena of society. Ward argues that at a certain stage the natural evolution of society passes over into an artificial and teleological evolution in which society consciously determines its own destinies. De Moiré asks what fact distinguishes society from other organisms, and answers that it is contract, including all understandings and alliances. The Platonic or moral-organic conception of society is elaborated with ability by John S. Mackenzie in *An Introduction to Social Philosophy* (London, 1890).

Much of the best work in sociology has been directed upon a more profound study of fundamental social processes. Gabriel Tarde (*Les Lois de l'Imitation*, Paris, 1890), finds the elementary and distinctively social phenomenon in imitation; Ludwig Gumplowicz (*Der Rassenkampf*, Innsbruck, 1883, and *Grundriss der Soziologie*, Vienna, 1895) finds it in the conflicts, amalgamations, and assimilations of heterogeneous ethnical groups. J. Novicow, of Odessa (*Les Loies entre les Sociétés humaines*, Paris, 1893), has studied exhaustively the phenomena of conflict and alliance; and Émile Durkheim (*De la Division du Travail social*, Paris, 1893) has shown that the division of functions creates not only economic solidarity, but, through reactions upon law and morals, a social and ethical solidarity. Of all these writers it is Tarde, undoubtedly, who has perceived the true and ultimate nature of social facts. Phenomena of any kind, as he points out, can be known only because they repeat themselves. In physics we study repetition under a variety of forms; in biology under the form of heredity, or the transmission of life and characteristics from cell to cell; in sociology under the form of imitation, or the transmission of impulse, feeling, and idea from individual to individual, from group to group, and from generation to generation.

Systematic sociology, however, is not an abstract science, tracing the operation of particular social forces through all their ramifications. On the contrary, it is a concrete science, descriptive, historical, and explanatory, concerning itself with the organization, activities, and evolution of those bands, hordes, tribes, and nations into which the animal and human populations of the world are distributed. Sociology is the fundamental social science, or the science of social elements and first principles, because it isolates the elementary and preliminary descriptive matter which is presupposed by all the special social sciences, whether abstract or concrete.

DESCRIPTIVE SOCIOLOGY.—Systematic sociology begins with analysis, classification, and generalization. It is necessary to observe the elements that are combined in social phenomena, to know the conditions under which they are brought together, and to examine the groupings and organizations that result. The elements of society are all included under the term *population*, which must be studied under its outward aspect of numbers, reproduction, increase, density, migrations, and the intermingling of races and nationalities; and under its subjective aspect of sympathies, antagonisms, tolerances, habits, and traits of character. These internal or subjective elements of society are combined in the subjective aspect, or internal constitution, of society itself—that is to say, in the common sympathy and purpose, the accepted tradition, the public opinion, the general will; in a word, in the social mind. Society as subjective, the social mind, projects itself and realizes itself outwardly in an external organization, which is twofold in form. There is a series of groups which are alike in all important respects, and merely repeat themselves to make up the larger aggregates. This series, which may be called the social composition, includes the family, the horde, the tribe, the town, the county, the commonwealth, and the nation. The other form of organization may be called the social constitution. Its basis is a division of labor, and it consists of associations engaged in different activities, some economic, some political, some cultural, but all co-ordinated in one complex system of mutual helpfulness.

Population.—The study of population in its outward or physical aspect begins with the facts of aggregation or grouping. Animal life and human population are massed in dense aggregates in certain places, in less dense aggregates elsewhere. Comparatively few individuals among animals or men live strictly isolated lives. This physical aggregation is the indispensable preliminary condition to the evolution of society. That there may be communication, companionship, and mutual aid, there must be propinquity and contact. These are ensured by the unequal distribution of food-supplies, the varying degrees of temperature and moisture, the topography and other physical circumstances, making life in some places easier than in others.

Looking still at the outward facts and neglecting for a time the internal factors of sympathy and social instincts, we observe that aggregation is of two forms. Individuals descended from a common ancestry are often found living near each other in and about the place of their birth, as in an isolated village, whose inhabitants have married in-and-in for generations and have never separated. This may be called a genetic aggregation. Other individuals born in many different places, perhaps in widely remote parts of the world, are found assembled and carrying on their life-activities in one place, as in a great modern city like London or New York. This may be called a congregative aggregation. The patriarchal theory of the origin of society assumed that genetic aggregation was the original form. The social-contract theory, logically carried out, would assume that congregative aggregation was the original form. Actually no large community is a genetic aggregation only, or a congregative aggregation only. The vital and mental energies evolved in regions where resources are on the whole abundant expend themselves not only in maintaining the food-supplies by industry, and in perpetuating population by reproduction, but in ceaseless motion, travel, exploration, and colonizing; while on the other hand, from regions where the life-struggle is becoming severe, population moves to more favored areas where the opportunities are greater. Migration is thus a normal phenomenon. Every community loses in this way individuals born within it and receives individuals born elsewhere. Every community thus has a mixture of population elements, which may be called its demotic composition. At the same time every community except colonies, and new cities in the first generation or two of their existence, is perpetuated mainly by its own birth-rate rather than by immigration. Society, therefore, we may say, is normally autogenous. It is for this reason that the assimilation of the foreign-born goes on with astonishing rapidity, even in a country like the U. S., which received from 1820 to 1890 an immigration of 15,427,657 souls.

Turning to the internal or psychical factors of society, the most elementary phenomena of social psychology are simple activities of feeling, perception, and will that involve two or more individuals, namely: (1) Mutual perception and communication, by motions, tones, or speech; (2) recognition of fellow beings of one's own kind or species as

like one's self and unlike all other objects; (3) imitation; (4) conflict; (5) toleration; (6) mutual aid, alliance; (7) mutual pleasure, play, festivity. These mutual feelings and activities constitute association as distinguished from the merely physical phenomenon of aggregation. An important question to be answered through the study of these phenomena is that of the relation of the social to the individual instincts. The notion which Hobbes converted into a classical doctrine, that individual instincts only are primitive and that "the state of nature" which preceded society was "a state of war," of each individual against every other, is not supported by the results of modern research. Among the lowest forms of life creatures do not prey upon their own kind, but upon other species. Even the amoeba, a mere drop of structureless sarcode, discriminates between fellow amoebae swimming near and such favorite food-objects as desmids and diatoms. This recognition of kind and of accompanying acts of imitation begins when a sentient creature identifies the feeling of touching a fellow creature as like the feeling experienced when it touches one part of its own body with another part. Such feelings can not be associated with nutrition because, even though one pseudopodium of an amoeba encountering another should coalesce with it, nutrition would not follow. Therefore, at the dawning of consciousness fellow creatures of the same species can not regard each other as food-objects. On the contrary, they necessarily imitate one another in capturing non-related food-objects, since the touch of a moving part of one is to another a stimulus like the touch of a moving part of itself against itself, and starts like motions. Consequently these beginnings of social feelings and social actions are as primitive as the individual instincts. Among the lowest animal forms, as among civilized men, the struggle for food is normally a rivalry or competition rather than a "war."

Under the pressure of scarcity, however, conflict may at any time break out. Cannibalism has doubtless everywhere had its origin in starvation. Toleration is then re-established by force, not by moral feeling, nor by a conscious calculation of expediency. The very strong kill off the very weak. The very strong are overborne by the numerical superiority of the individuals of average power. The latter are too nearly equal for one to hope to vanquish another, and their resulting toleration is an equilibrium of strength, which is tested from time to time, and so maintained, by frequent acts of aggression and revenge. Toleration being established, fellow-feeling, sympathy, and imitation can work themselves out, step by step, with the evolution of intelligence, in the positive forms of mutual aid, alliance, and mutual pleasure. Mutual aid begins in accidental helpfulness and protection, and is perpetuated consciously when its benefits are perceived. Social pleasures are observed among nearly all the higher animals, as among men. Among the birds and the more intelligent mammals infancy and youth are a continuous playtime. In social pleasures the higher sympathetic feelings, which presently become the strongest social bonds, are developed, and the cultural activities are born. Mutual aid is the foundation of political alliance and of economic organization. Toleration is the foundation of justice. Imitation is the foundation of diversified desires and individual industry.

Association reacts on the associated individuals, developing in them a social nature; but owing to differences of circumstance and of heredity the development does not go on equally, or at the same rate, in all parts of the population, and social classes result. In a majority of individuals fellow-feeling, imitativeness amounting to industry, tolerance amounting to justice, helpfulness, and companionableness, are ruling qualities. This class is the normally social. In other individuals these qualities are deficient or absent, but are simulated. Pretending to have the social nature and appealing to those in whom it is real, these pseudo-social characters, if not aggressively anti-social, make up the pauper class. Yet others, whether simulating the social nature or not, having become aggressively anti-social, are the criminal class.

The Social Mind.—The foregoing mental and moral elements of society are combined in products which we call by such terms as the common feeling, the moral sense, the public opinion, the general will, of the community, and which it is convenient for the sociologist to name collectively the social mind or the social consciousness; but care is necessary to avoid associating false conceptions with these terms. They do not stand for mere abstractions. The social mind

the concrete thing. It is more than any individual mind and dominates every individual will. Yet it exists only in individual minds, and we have no knowledge or wisdom of any consciousness but that of individuals. There is no real power here, however. The social mind is the phenomenon of many individual minds in interaction, so playing one upon another that they simultaneously feel the same emotion, arrive at one judgment, and perhaps act in concert. It is therefore, as Tardieu has called it (*Les Loix Sociales*, Paris, 1894), a social logic, binding the products of individual logic into more complex wholes.

The social integration of desire, belief, and will, which constitutes this logic, is effected sympathetically or rationally; passionately and violently, or deliberately. The mode is seen in popular fads or crazes, panics, emotional revivals, mobs, lynchings, riots, violent revolutions. The other is seen in the proceedings of a parliamentary body, the execution of legal justice, the movements of a disciplined army. The proportion of rational or deliberative action depends on the mental evolution of the population, its homogeneity, and the amount of its criminality. The greater the criminality, the less the rationality and the greater the violence.

In discussion and deliberation sensibly arrives at self-consciousness. Each individual concerned makes his neighbor's thought the object of his own thought at the same instant, but he makes his own thought such an object; he judges the two to be identical, and then acts with a full belief that his fellows have come to like conclusions and will act in like sense.

The primary products of the social mind are social choices and values. These are further combined with references to the phases and interests of life into standards of living and of industry, rules and methods of art, laws of conduct, political policies, religious faiths, scientific doctrines, ethical ideals, all of which, based on firm and consistent action to another, become traditions. The three primary traditions are: (1) The economic, consisting of the whole body of knowledge and usage pertaining to material well-being; (2) the juridical, consisting of the customary and positive law; (3) the political, consisting of the political history, policy, and aspirations of a state. Secondary traditions are the dogmatic, the scientific, the religious, the scientific, and the artistic.

All values, standards, rules, faiths, and traditions exist in individual minds only. Durkheim's argument, that they are independent objective realities because they can be consulted in writing, is a fallacy, since the written page is meaningless apart from the living knowledge of the reader. But they exist in a multitude of interacting minds simultaneously, and are therefore objective as well as subjective to each individual. Upon each mind as it unfolds they are imposed from without, and sanctioned by penalties for disregard or disobedience that range from ridicule, disapproval, and boycotting to collective force or vengeance.

Through the channels of these different traditions the social life of society flows in an ever-changing distribution. At one time society is religious, at another time creative and artistic, at yet another time scientific. One generation is absorbed in political concerns, another in business affairs. Always, however, a tendency toward the establishment of a social equilibrium may be observed. At any given moment desires and beliefs assume unlike forms and find varied expression in different parts of the population. The social codes and fads are mutually dependent. This is the social force in its highest manifestation.

The social mind not only creates codes and fads and imposes them upon individuals; it relies upon the grouping of individuals which grow up more or less unassisted, and upon various relations of mutual aid. Sanctioning some groupings and relations, opposing others, it shapes the social structure or organization.

The Social Composition.—In the social structure by composition small groups are combined into larger groups, and these again into groups yet larger. Each group, whether small or large, contains both sexes and more than one generation. Each, therefore, might live independently of the others, perpetuate itself, and grow to larger dimensions. Each group is made up of elements that are less like each other than one group as such is like another group of similar composition. For example, father, mother, and child in the family are more unlike than are two families of the same kind or type. The inhabitants of a town in which are found different nationalities, perhaps, different ages, different shil-

lides, characters, and fads, are more unlike among themselves than are neighboring towns one to another. Each group has much the same characteristics and lives in nearly the same way as any other group of similar dimensions and composition. Such groups therefore supplement or potentially add each other only in power and mass, not in division of labor.

The unitary group in societies of the higher animals, or of men, is the family, which may be a temporary or an enduring union of one male with one female and their offspring, or of one male with two or more females (polygyny), or of one female with several males (polyandry), or of several males with several females (polyandry or communistic marriage).

Human societies composed of families grouped in larger aggregates are of two types, the ethical and the despotic. Ethical societies are marked by affection; a real or fictitious kinship is the chief social bond. Domestic societies are congenially aggregative. They are groups of people bound together by habitual intercourse, mutual interests, and cooperation, with little or no regard to origins or to genetic relationships. Ethical societies are the earlier. Despotic societies have been developed out of the ethical. Among ethical societies many are matrilineal, kinship being traced through the mother name only. Others are patrilineal, with the kinship traced through the father name only. Matrilineal relationships are the earlier.

The smallest ethical society, whether matrilineal or patrilineal, is the horde, which is a group of from three or four up to twenty or thirty families, dwelling together in a camp or village. The Hudson, Fingans, and Imlis afford examples. The next larger group is the tribe, an organization large enough to have been formed, and probably having had its origin in fact, in an alliance of several herds for defense or aggression. Herds and tribe are often conflated in ethnological writings with the clan or gens, which is a totally different organization from either. The herds, and likewise the tribe, includes and claims all of its descendants, whether through its daughters or through its sons, who dwell together in the parent camp. The clan, on the contrary, is a partly natural, partly artificial brotherhood and sisterhood, which rightly excludes all of the descendants of its sons if matrilineal, or all the descendants of its daughters if patrilineal. A clan therefore can never be properly identified with a horde or with a tribe. It may be a section of a tribe, or its membership may be scattered through many herds or through several tribes.

Related tribes bound together by kinship ties and speaking dialects of the same language, when they unite in a military or political federation are a folk or ethnic nation. Such were the allied six tribes of the Iroquois, and such were the confederated Franks, the Lombards, and the Angles.

In despotic society the smallest community is the deme, village, or township. Townships are combined into counties, counties into commonwealths, commonwealths into federal states.

The social composition is affected by the deliberative action of the social mind under the pressure of external necessities, especially those of defense and aggression. When integration has been accomplished the social mind puts its own impress on each component group and moulds it into conformity with a certain type. Thus in a given community every variety of the family may have existed at the outset or may from time to time appear; but the social mind gives approval and sanction to some one type, as the monogamic or the polygamous, and prohibits or disencourages all others. In like manner in the commonwealth each component town, and in the federal state each component commonwealth, is compelled to conform to a type or standard. Psychologically, therefore, the social composition may be described as a mutual toleration and alliance of the unlike among the individual elements of a society, supplemented by an alliance of the like and non-toleration of the unlike among its component groups.

The Social Constitution.—The social structure by constitution is a re-ordination of associations, any one of which may or may not include both sexes in its membership, but in any case does not include them both for purposes of marriage and reproduction. Accordingly, the constituent associations of society are mutually dependent, and each presupposes the social composition. Each association is composed of individual elements that on the whole are more like than associations themselves are to one another. The members

of a given trade-union are more alike with reference to the purpose which unites them than one trade-union is like another; otherwise the differing members would connect themselves with other unions. The members of a given church are more alike in feeling and belief than one church is like another. The members of trade-unions collectively or of churches collectively are more alike than trade-unions in general are like churches in general. Each association does a specific work; it may be said to have a functional purpose. Combination among associations is therefore a co-ordination, and mutual aid among them is not through mere increase of mass and power, but by a division of labor.

The social constitution is analogous to that of a biotic organism, as Spencer has shown; but the analogy is of limited value for scientific purposes until supplemented by a close study of those features of social organization that are distinctive. Of these the most important is a more perfect actual or potential duplication in the social organization of the organs or agencies for performing every essential function. Though in the animal many vital organs are duplicated, there neither is nor can be any complete duplication of the alimentary, the circulatory, or the nervous system. Public association or the state can at need assume every social function. Voluntary association can do the same. It is as if the cerebral nervous system, on the one hand, had the emergency power to organize from the body-tissues a new alimentary and circulatory system, and the sympathetic nervous system, on the other hand, could at will assume the functions of the brain and spinal cord. This power of public and of private association to assume each other's functions is maintained, because at all times some duplication is in fact kept up in every essential class of social services. The error of attributing to the state defensive and juridical functions only, and to private associations economic and cultural functions only, is being constantly repeated in political and economic writing. The fact is that the state performs always important economic functions of production, transportation, exchange and finance, and cultural functions, religious or educational, and that private associations, such as political parties, political clubs, revolutionary societies, and private tribunals to achieve political or juridical ends, are among the most important voluntary organizations known. The socialists, therefore, are right in saying that the state could, if necessary and desired, carry on all social undertakings, and the individualists are right in saying that society could get on, and in a way achieve its ends, without the organized state; but both are wrong in supposing that either thing will happen under a normal social evolution. The actual distribution of functions between public and private agencies is a varying one, always changing with changing circumstances. Consequently, movements tending to increase public activity on the one hand or to enlarge the opportunities for private initiative on the other hand will be self-limiting so long as conditions are normal. They should be regarded as tendencies toward equilibrium. Whatever belittles the state or destroys popular faith in its power to perform successfully any kind of social service—whatever impairs the popular habit of achieving ends by private initiative and voluntary associations, by so much endangers society, checks its development, and prevents the full realization of its ends.

The supreme end of society is the protection and perfecting of sentient life. The end of human society is the evolution of the rational and spiritual personality of its members. The associations directly concerned in this function are the cultural, namely, the religious, the scientific, the ethical, and the æsthetic, the educational organizations, and what is called polite society. Economic, legal, and political organization exists (in a functional sense) for the sake of cultural organization and activity. The social mind always has perceived this truth, and by means of its sanctions has endeavored to mould the social constitution into accordance with it. Associations and relationships sanctioned by the social mind are known as institutions, and they are fostered or abolished always with a view to cultural as well as to protective ends. For both ends specialization and division of labor are necessary. Society is obliged to tolerate and promote differentiation in its constitution while it maintains the homogeneity of its composition. Psychologically, therefore, the social constitution may be described as an alliance of the like and non-tolerance of the unlike in each simple association, supplemented by toleration and co-ordination of the unlike in complex association—that is to say, in the re-

lations of each association to other associations and to society at large.

HISTORICAL SOCIOLOGY.—The stages of sequence in social evolution have corresponded roughly to the four stages of synthesis above described. Concourse, fellow-feeling, social instincts, and mutual aid had their origins in animal society, and it was by means of them that animal life was developed into various types. The first stage of association, therefore, was zoögenic. In the second stage the evolution of speech and the genesis of a varied tradition made the social mind self-conscious, and transformed the anthropoid into man. Society then was anthropogenic. The third stage, in which the social mind, acting on spontaneous forms of alliance, created clan, tribe, folk, and nation, was ethnogenic. In the fourth stage a wonderful development of the social constitution, with division of labor, has made possible a high utilization of resources, a rapid multiplication of population, and a democratic evolution of the social mind. Society has become demogenic.

Zoögenic association is as old as sentient life. All biological speculations that ignore the social factor in the struggle for existence are imperfect, and without appeal to it the evolution of animal intelligence can not be explained at all. Long before man appeared on the earth sympathy was highly developed, the art of communicating feelings and simple ideas, by tones and gestures, was practiced by millions of creatures, family relationships were established, and bonds of mutual aid, companionship, and pleasure held together swarms, flocks, troops, bands, and herds. Even the beginnings of tradition had appeared. Association had become the most important defense and help in the life-struggle. The survival of the fittest was the survival of the social.

Anthropogenic Association.—Therefore nothing could be more unscientific than a theory of human origins through the evolution of a single pair of anthropoid apes into man and woman. If science abandons the dogma of special creation, it must abandon also the dogma of a first pair. There could have been no continuity of animal and human descent without a continuity of animal and human society. If anthropoid apes became simian men, a whole community or many communities underwent the transformation. John Fiske's theory (*Outlines of Cosmic Philosophy*, Boston, 1874) that the prolongation of infancy, as an incident of the physical evolution of man, by holding the family together for a relatively long period prepared the way for more extended social relations, reverses the probable order of cause and effect. Increasing social intercourse stimulated and developed the cerebral nervous system. Cerebral development entailed the prolongation of infancy, which, in turn, by delaying the use of arms and legs and jaw, altered the proportions of the skeleton and the facial angle.

These changes, it is probable, took place step by step with the evolution of speech and of tradition. Many evidences point to communal festivity, with its attendant rhythmical gesticulation and some approach to song, as the means by which, under the influence of mental exaltation, conventionalized sounds were so definitely associated with feelings and ideas as to constitute the beginnings of speech. (See LANGUAGE.) Industrial traditions had their beginnings among animals. Most characteristic of the beginnings of human society were the primitive explanations and traditions of life, death, and causation, known as ANIMISM (*q. v.*), and the ghost-theory. See also ANTHROPOLOGY.

Ethnogenic Association.—There is no reason to doubt that the earliest hordes of men were composed of family groups. Among the higher mammals the troop, band, or herd is subdivided into pairs, families, or studs, and it would be astonishing to find that the same thing was not true of the primitive hordes of men. At the same time the relations of the sexes may have been of the loosest description. Writers on the history of marriage have too often made the mistake of assuming that the two things must be inconsistent. The living together of man and woman does not always preclude irregular indulgence on the part of either. Festival occasions are still, in many parts of the world, opportunities for conduct closely approaching promiscuity by men and women who, none the less, live habitually in family relations. The trading of wives also, and the lending of wives to guests, are customs of friendship and hospitality in many communities.

It is probable, further, that, as a rule, the domestic group was a simple pairing or monogamous family, in which male jealousy and power played the important part ascribed to

done by Darwin and Sir Henry Sumner Maine, and that exogamy and polygyny were exceptional deviations from the monogamy type. The argument for a primitive polygyny is based on the fact that primitive kinships were matrilineal, and the attempt to explain it by uncertainty of paternity. Another explanation is quite as good. A family established by the forcible appropriation of the woman and maintained by masculine power is dissolved the moment the man dies of his captive and deserts her. Her offspring, knowing only the mother that cares for them, will take her name. That primitive family units were commonly of such brief duration and followed by such consequences is extremely probable. See MAESTRANI.

The family, as a rule, was exogamous—that is, the sons preferred to take wives from other households instead of from among their sisters. This is a preference that had its beginnings in animal life, as Westermarck has shown, and was strengthened by the influence of novelty upon the sexual passion, supplemented by natural selection. When several herds dwell in such proximity that some intercourse, friendly or hostile, is possible, the preference may extend to the women of other herds, and especially if the practice of obtaining them by force, theft, or stratagem causes them to be prized as trophies of prowess or cunning. The herds, then, like the households, may become exogamous.

Brothers and sisters by blood are a natural property-holding and defensive group, spontaneously aiding each other to redress wrongs inflicted by other groups. In pursuing its interests and redressing its wrongs, it seeks the aid and protection of supernatural power. In the animistic stage of culture some natural object, plant, or animal, which is regarded with superstitious veneration, becomes the special guardian of the household. Believing that a mysterious kinship can be established through touch, by imitation, and in other ways, the members of the fraternal circle do not doubt that they may become akin to the object of their worship, and to make sure that they always bear its protection with them they mutilate or mark themselves or their clothing or belongings with a sign or rude image of the sacred object. From every practice of the kindred circle is thought of as sanctioned by its totemic deity, and any deviation from established custom is looked upon as a sacrilege, sure to be followed by dire penalties. In this way exogamy becomes a binding obligation and hence a sin.

For a long period each little fraternity of uterine brothers and sisters in each succeeding generation is likely to have its own totemic deity; but sooner or later, under the influence of their mother and her relatives, or through reasoning that they are descended from their mother's totemic deity, a circle of brothers and sisters is sure to adhere to the mother totem and worship, instead of adopting a new one. From that moment the totemistic circle begins to enlarge. In the second generation it necessarily includes brothers and sisters, uncles, daughters and sons, uncles and aunts, nephews, nieces, and cousins. Since kinship is reckoned through mothers, but not through fathers, the circle will enlarge and include the children born of its daughters, and will exclude those begotten by its sons. Children of sons will belong to the kindreds of their mothers; and since in the household exogamy has become superstitiously associated with totemistic worship, and what was originally an instinct has developed into the idea that men must not take wives of their own totem, the wider totemistic circle also must be exogamous. The kindred has become a clan.

Though the clan can never be perfectly identified with the herds, and if neighboring herds are exogamous each clan will have members in several different herds, there are two ways in which a majority of the members of a herd may belong to the same matrilineal clan. Men may go to live in the residences of their wives—beena-marriage. In this case clansmen with their children and unmarried male kinsmen may live together in one place, and their husbands, belonging to many different clans, will be an unimportant authority. If, however, men steal or buy their wives—dead-marriage, who then follow the residences of the husbands, the children of a matrilineal clan will be dispersed through many herds, and each herd will be made up of members of many clans. Nevertheless it may happen that divorced wives and their children return in such numbers to their parent herds that the clan is always tending toward identity with the herds. A cluster of neighboring herds may thus be transformed into a cluster of herds-clans.

When neighboring clan-herds draw together into a tribal organization, the lines of demarcation between herds as

such may disappear or cease to have importance, while the clan-ship lines remain sharply defined. Composed of herds the tribe is constituted of clans, mutually dependent because exogamous. If a clan, becoming large, subdivides, the tradition of original unity is often preserved in the phratry, a fraternity of clans. If a tribe subdivides, individuals from each of its clans go into the new tribes. The household is the economic organization of the community, developing and handing on the economic tradition. The phratry is the religious organization, guarding the religious tradition. Its secret societies of medicine-men are the germ of a priestly and professional class. The clans are the juridical organization, developing and applying a customary law which regulates property rights, marital rights and limitations, feuds, and vengeance. The sachems, elected by clansmen and clanswomen, are the first lawyers and judges. The tribe is the military organization. Its council is composed of the leaders or chiefs of the volunteer war-parties put forward by each clan. In the tribal council a military tradition is evolved. True political organization begins only when tribes confederating become a folk or ethnic nation. Then for the first time the juridical power and the military power are combined in one governmental system, as different expressions of a single sovereignty.

Patronymic societies exhibit the same forms and stages of organization as matrilineal, with the exception of differences that necessarily follow from kinship through fathers. The change from mother-kinship to father-kinship may occur at any stage of social integration; in the horde or in the folk. It is effected by economic circumstances or evolution. If the family can survive only through the industry and protection of the father, as among the *Esquimaux*, who depend on the arduous and dangerous chase of the walrus, it will hold together long enough for children to grow up under paternal authority and take the father-name. When under different conditions wealth in flocks and herds begins to be important, men appropriate it and desire to transmit it to sons instead of to sisters' children. Patronymic kinship prepares the way for an advance in culture from animism to ancestor-worship, which in turn greatly strengthens paternal power. With dual-marriage and patronymic kinship the herds and the clan can become nearly identical, compact, and powerful. In herds, clan, and tribe chieftaincy can become hereditary. Chieftains can become the founders of a nobility, and the chief military leader of a folk, becoming a true king by uniting supreme religious and judicial authority with his military functions, can found a royal family. Kings and chieftains receiving from their followers large shares of the booty of war, and privileges in the tribal land, enrich their favorites, who in turn, attaching to themselves the broken and ruined men of shattered clans and tribes, become the "cow noblemen" and systematic marauders of that barbaric feudalism which in time seriously undermines the kinship or gentle organization of society and prepares the way for another system. See, further, *ERNESTOWAY*.

Demogonic Association.—In ethnogenic association the social constitution is incidental to the social composition. In demogonic association the state has become supreme. It subordinates and rearranges the social composition and perfects the social constitution.

A tribal confederation seldom establishes itself permanently upon the territory where it originates. It moves on to conquer richer regions, and, if successful, reduces their inhabitants to slavery or serfdom. Increasing then in wealth, it attracts to itself strangers from far and near, who presently become so large an element in the population that it is no longer possible to organize legal and military administration on the clan-ship and tribal basis. Legal rights and membership in the state are made to depend on civic association within territorial limits. Society orders upon civilization.

Civilization exhibits three stages. Egypt and Babylon did not get beyond the first, Greece and Rome did not complete the second. The modern Western nations have entered fairly upon the third. In the first stage all the energies of society are concentrated upon the task of political integration and defense. To this everything else is sacrificed or subordinated, and government is absolute. This work completed, the liberated national energies expend themselves in criticism, in the struggle for personal freedom, and in the effort to combine liberty with stability through the constructive evolution of municipal and constitutional law. Greece failed in legal construction, and Rome sacrificed

spontaneity to system. The civilizations of Greece and Rome, like those of the Eastern nations, were unstable, because they were surrounded by a worldwide environment of barbarism and savagery. The modern Western civilizations are stable because they simultaneously grew to great and powerful statehood in an environment of civilization, which for ages had lain between them and the more remote barbarism of Africa and Asia. Consequently there was no necessity for an extreme sacrifice of personal initiative and the lesser interests of life. The second stage also with them was no partial evolution. The Renaissance, the Protestant Reformation, the American and the French revolutions were but so many phases of a thoroughgoing criticism and reconstruction of the social constitution on lines of legality and free association. By means of this strong but elastic union of voluntary and flexible organization with law, the magnificent development of modern industry and a consequent multiplication of population without parallel in history have been made possible.

Spencer's generalization that societies are military or industrial in type is therefore neither adequate nor altogether accurate, in the form in which he has stated it. Militarism and industrialism are stages rather than types, and between them lies the stage of critical and legal reconstruction, which is the cause, rather than the effect, of industrial evolution.

The development of the fundamental social interests thus reverses the order of their genesis. Society is first economic, then juristic, then political. Perfecting then the political system, it works back through law to the economic foundations. Not so in its cultural interests. The order of their genesis—religious, scientific, ethical—is the order of their development. The political era is also the great religious period; society is theocratic. Then the social mind goes forward to critical and scientific activity while it applies itself to legal construction, and it is only by the aid of science and criticism that legal construction is accomplished. Finally, when it works back to industrial problems it advances to a serious study of ethical principles and ideals, and only as it does so can it hope to adjust the complicated relations of economic life. Future society, increasingly economic, will be also increasingly ethical.

EXPLANATORY SOCIOLOGY.—The details of explanatory sociology are yet to be worked out, but certain principles are established. The interpretations of social structure and evolution must be in terms of natural causation; but psychological phenomena, no less than physical, are natural, and society must be explained in terms of motives and choices, as well as in terms of outward forces.

The initial causes of society are physical. Aggregation and association are brought about by geographical and organic conditions; but association furthers survival and happiness, and the associated individuals, becoming consciously and fully aware of the benefits of society, attempt to defend and improve it. The unconscious natural process thus becomes conscious and artificial. Relations and activities are valued, choices are made, policies are devised, and institutions founded. The process does not end here, however. Natural selection works among policies, laws, and institutions, as among individuals. Some fail to benefit the community, and disappear. Those that survive are not always the ones that were supposed to be most promising at their inception.

The further task of sociology, therefore, is to discover the details and laws of these complicated processes. It must try to formulate, first, the laws of the purely physical and unconscious causation that occurs in society; second, the laws of conscious social choice; and, third, the laws that govern the natural selection and survival of arrangements, laws, and institutions.

Society has often been described as an organism. Being essentially psychical it is more and higher than an organism. It is also more than a multitude of individual minds. It is a psychological organization of conscious organisms.

Donovan, *The Fæstal Origin of Human Speech in Mind* (Oct., 1891); Sir Henry S. Maine, *Early History of Institutions* (London, 1875) and *Early Law and Custom* (London, 1883); Westermarck, *History of Human Marriage* (London, 1891); Fustel de Coulanges, *La Cité antique* (1864; Eng. trans. Boston, 1873); Smith, *Kinship in Arabia* (London, 1885). FRANKLIN H. GIDDINGS.

Socorro: town of Colombia; in the department of Santander, of which it was formerly the capital; on a plateau, 40 miles S. S. W. of Bucaramanga; 4,120 feet above the sea (see map of South America, ref. 2-C). It was founded in 1540 on the site of an Indian city, and was removed to its present site in 1681. In 1781 it was the center of a formidable revolt, and it was the first place in New Granada to declare for independence in 1810. Hand-woven mantles and "Panama" hats are exported. Pop. about 18,000. H. H. S.

Socorro: city: capital of Socorro co., N. M.; on the Rio Grande river, and the Atch., Top. and S. Fé Railroad; 75 miles S. by W. of Albuquerque; 178 miles N. of El Paso, Tex. (for location, see map of New Mexico, ref. 12-R). It is engaged in mining and smelting gold, silver, and lead, raising cattle, sheep, and goats, agriculture, fruit-culture, and lumbering; and contains 6 churches, 3 public-school buildings of brick (cost \$25,000), State School of Mines (cost \$50,000), 2 national banks with combined capital of \$100,000, and 2 weekly newspapers. The city has an excellent climate that is highly recommended for persons in the early stages of consumption. When discovered by the Spaniards, the site was occupied by an Indian pueblo. The place was settled by Franciscan fathers, was destroyed and abandoned in 1650, and was again settled in 1765, 1794, and 1804. Pop. (1880) 1,272; (1890) 2,295; (1895) estimated, 4,000.

W. S. WILLIAMS, EDITOR OF "CHIEFTAIN."

Socotra: an island in the Indian Ocean, off the eastern coast of Africa; in lat. 12° 39' N., lon. 54° 1' E., 140 miles N. E. of Cape Guardafui; controlled by Great Britain. Area, 1,384 sq. miles. The interior of the island is mountainous, and mostly unproductive, on account of insufficiency of water, the streams drying up completely at certain periods, but the coast-land, generally from 2 to 4 miles broad, is low, level, and fertile. The island produces good tobacco and dates and the best aloes known, and has superior sheep and goats. There is considerable trade with Muscat. The climate of Socotra is more temperate than that of the adjacent continent. Pop. estimated at 10,000, mostly Arabs, Negroes, and descendants of Portuguese.

Revised by M. W. HARRINGTON.

Socrates, sok'rā-tēz: philosopher; son of Sophroniscus and Phanarete; b. at Athens in 470 B. C. (or 469, in May or June); drank the cup of poison 399 B. C. (in April or May?). His father was a sculptor, and Socrates in his early years worked at the same occupation. He alludes to his mother (*Theaitetus*) as a midwife, and likens to her art his own skill in drawing out ideas by conversation. In his youth he learned geometry and astronomy and practiced gymnastics. He is reported by Plato (*Phædo*) as having studied the work of Anaxagoras on *Nature*, probably under the instruction of Archelaus, the disciple of Anaxagoras; and according to Xenophon (*Mem. I. and IV.*) he had a critical knowledge of the writings of the early wise men, as well as of the Ionian school of philosophy. He probably met Parmenides when about twenty years of age, and mastered the Eleatic view of negative dialectic (which proved its theories by showing up the contradictions of its opponents), and was thoroughly instructed in the doctrine of the Sophists—possibly may have received direct instruction from Prodicus. It is said that having early lost the patrimony inherited from his father, the wealthy Crito assisted him in his education, and employed Evenus to instruct him in poetry, Theodorus in geometry, and Damo in music, and that the celebrated Aspasia had a share in his culture. He married, and had three sons. Xanthippe, his wife, has come down in history as the typical scold. Socrates is represented as using the violence of her temper as a means of cultivating his patience. He took part in three military campaigns with his fellow citizens—that of Potidæa (432 B. C.), wherein he saved the life of the young Alcibiades, who was wounded; that of Delium (424 B. C.), in which he saved the life of Xenophon, and himself received assistance against his Boeotian pursuers from Alcibiades in the disastrous retreat which followed, and wherein his own cool bravery was conspicuously manifested; and that of Amphipolis (422 B. C.). He proved himself to have an extraordinary capacity to endure cold, heat, and fatigue. He walked barefoot upon the ice and snow of Thrace in his usual clothing, while others were clad in furs. By this time he had become noted for his peculiar mode of instruction by means of conversations which he held with people of all classes at the public resorts. Aristophanes in *The Clouds* held him up to ridicule as the arch-Sophist, as a dreamer, morally worthless and physically incapable (as Grote re-

markedly toward the time when Socrates was exposing his life for his country on the battlefields of Delium and Amfipolis. The personal appearance of Socrates was such as to make the Athenian sense of the beautiful with a turned-up nose, preferring eyes held inward, thick lips, small body, he resembled a satyr or Silenus: he wore a miserable dress, and would frequently stand still in sudden fits of abstraction, staring his eyes, staring out vacancy. Aristophanes found in him the almost perfect type-comedy. Modern historians have justified his large measure the poet, and painted out his patriotic desire to save his native city from the decline in morals and political ideas which he saw impending from the prevalent tendency to reflection and sentimentalism—the cultivation of independent subjectivity or individualism (the right of private opinion) as contradicted by the implied, unreflecting obedience to custom and laws. This he traced, correctly enough, partly in the teachings of the Sophists or private teachers of culture, among whom Socrates was acknowledged to belong, by his contemporaries, notwithstanding his radical differences from them in doctrine. He common with Socrates, the Sophists cultivated reflection—to make up the mind on rational personal grounds. Dialectic was the art of the advocate and orator, as much needed before the courts and popular assemblies of Athens—the art to make the worse appear the better reason: an art which could be applied in good purposes or to bad ones, and not in itself a corrupt art. It was the same art that is cultivated in the debating societies and moot courts of young lawyers of our own time. Plato and Aristotle were the first to bring the name "Sophist" into odium as a perverted species of philosophizing. Aristophanes condemned equally all species of philosophic reflection. Isocrates calls Plato a Sophist, and Aristotle calls Aristippus, the disciple of Socrates, a Sophist. Socrates was selected as representative of his profession by Aristophanes because of the minority of his personal appearance and his missionary habit of practicing his art among all classes without price. In *The Clouds* he is portrayed as teaching a vain and profitless science of wisdom, corrupting in its influence upon youth and undermining all true discipline and morality. Twenty-four years after the appearance of *The Clouds*, Melitus, a poet, succeeded by Anytus, an influential demagogue, and Lycon, an orator, long up an indictment against Socrates accusing him of being "guilty of crime—first, for not worshiping the gods whom the city worships, but introducing new divinities of his own; next, for corrupting the youth. The penalty is death." Lycon is said to have felt aggrieved at what Socrates had said of the orators (see his attack on orators in Plato's *Hippias*); Melitus, for his treatment of the poets; Anytus, a rich leather-dealer, had been driven from Athens during the rule of the Thirty, and as Socrates was supposed to sympathize with the tyrants, and especially with Critias, the most detested of them all having taught him when a young man, his feeling toward the accused may be explained. Moreover, a son of Anytus had become interested in the conversations of Socrates, and the latter had interfered with the father to educate his son for something better than a leather-seller. To produce aspiration for a viceroyalty the family vendetta was "corrupting the youth." Socrates had conversed with his dialectic skill and bitter irony most of the celebrated statesmen, orators, poets, Sophists, and artisans of Athens. None had forgotten their humiliation at his hands; a few had sought help and instruction from him afterward, but most of them avoided his presence and detested revenge. Very many of these were to be found among the 500 (557 according to Diogenes Laertius judges who sat at his trial. In his defense before his judges he was so bold and free-spoken that he produced a very unfavorable impression, and was accordingly adjudged to be guilty, by a small majority. According to custom, he was allowed to name the punishment he preferred to substitute for the penalty of Melitus; he gave it as his opinion that he deserved to be sentenced in the Prytaneum at public expense for the rest of his life as a benefactor of the state, but upon the solicitation of his friends agreed to ask a brief *third* exile. This suggestion was ignored by the judges and there voted by a majority of eighty votes for his death. The execution was delayed for thirty days, until the return of the sacred ship from Delos. Socrates refused to avail himself of the means of escape from prison offered him by Ctes, thus attesting his law-abiding character. He drank the cup of hemlock with perfect composure after a conversation with his friends upon the immortality of the soul, being assured that he was merely setting out upon a happy

journey, and that by his death he attained the desideratum of his convictions to his disciples, and thereby accomplished far more than by living.

As to the least authority regarding the actual teachings of Socrates there has been much dispute. He has left behind no writings of his own, and we know him chiefly through his two disciples, Xenophon and Plato. It is supposed that the *Memorabilia* of the former give us a more accurate picture of his method and ethical doctrine, while the *Dialogues* of the latter present us with highly idealized portraits, and offer us the further-developed doctrines of Plato through the mouth of Socrates. Aristotle testifies that to Socrates belongs the honor of the invention of induction and accurate definition of terms. His dialectic rests on induction. More important even than this was his practical application of the Delphian precept, "Know thyself," as the condition of virtue. Aristotle (*Nick. Eth.*) says that his fundamental idea is the union of theoretical insight and practical virtue. This virtue is a knowing is a very radical statement, and altogether incomprehensible unless one considers its relation to the time to which it was uttered. Believed of its exaggeration, perhaps it means only that self-consciousness is essential to responsible action. It expresses the transition from the morality of custom and habit, mere conventional use and wont, to morality as conscious right-conduct, resting on reflection and moral principles. In this, therefore, Socrates is the most significant personage in the ethical history of the race. All beyond him lies in the region of unphilosophical use and wont, or prescriptive ethics, like that of the Chinese and other Oriental civilizations; on the other side the chief interest is the ever-widening influence of the individual consciousness of moral necessity, the long and gradual discipline of mankind into independent, responsible wills, endowed with "rights of conscience." In the antiseptic principle the individual takes the impulse of his volition from external phenomena—from auspices or auguries, nothing being undertaken without them. Individual conscience and personal decision date from the epoch of Socrates, and their growth from that time is the progress of the world-history. The new principle in its appearance with Socrates is as yet undeveloped, and involved with much that is foreign to it and contradictory of it. His daemon (*daemōn*) or "genius" is a relic of the old, and is akin to those immediate stages of psychical life which we know under the names *ecstasies*, *dreaming*, *premonition*, *hypnotism*, and is a return of the conscious mind to its fetal stage of existence, to instinct—the transplanting, as it were, of the sagacity from external appearance to internal impression. On the other hand, it was related to the consciousness of principles, and as such formed a factor of what we call conscience. There is no individual responsibility without conscious determination of the will, and even the perverse action of the conscious will is higher than mere unconscious action: a wicked man is a higher order of being and more precious in the sight of God than a good, obedient ox or horse. Socrates seems to have exaggerated this view so far as to make all virtue to be correct knowledge, and all vice to be ignorance, thus ignoring the will altogether. This, however, is not surprising when we consider the purity and the greatness of his insight into knowledge as a factor of true moral action. Nor, if we consider the ultimate consequences of perfect insight, can we regard him as wrong in holding that ignorance is the occasion of all wickedness, although we insist that moral responsibility implies knowledge of the right, and assert that wickedness is pervasiveness of will in the face of better knowledge. See MORAL PHILOSOPHY.

The panegyrics pronounced upon the character of Socrates are not surpassed. That of Alcibiades in Plato's *Symposium* is perhaps the finest—that of Xenophon more sober and weighty: "Knowing him to be such a man as I have described—on plans toward the gods as never to undertake anything without first consulting them; so just toward men as never to do the slightest injury to any one, while he conferred the greatest benefits on all who came in contact with him; so temperate and chaste as never to prefer pleasure to what was right; so wise as never to err in judging of good and evil, nor needing the aid of others in order properly to discriminate between them; so able to discourse upon and accurately define the subjects we have mentioned; so skillful in penetrating the hidden characters of men, and seizing the fittest time to reprove the erring and turn them to the paths of virtue—I can not but regard him as the most excellent and happy of mankind." The sources of information as to his life are Xenophon's *Memorabilia*, Plato's

works, especially the *Apology*, *Phædo*, and *Symposium*; Aristotle's *Metaphysics* and *Ethics*; Diogenes Laërtius (book ii.); and, among others of modern writers, the essays of Schleiermacher, Boeckh, Van Heusde, Hegel, Forchhammer, Brandis, Röttscher, and Grote are important. Zeller's *Socrates and the Socratic Schools* is the best work accessible in English.

WILLIAM T. HARRIS.

Soda [from Ital. *soda*, liter., fem. of *sodo* (collat. form of *solido*, solid) < Lat. *solidus*, collat. form of *solidus*, solid]: in chemistry, a hydrous oxide of the metal Sodium (*q. v.*), Na_2O ; in commerce, however, the compound formed by the action of water upon this oxide, and generally designated, even by chemists, hydrate of soda or sodium hydrate. The carbonates of sodium also are often called soda commercially. Sodium hydrate, NaOH , or caustic soda, is prepared commercially from the carbonate by the action of lime. Three parts of crystallized carbonate (*sal-soda*) are dissolved in five times as much boiling water, and one part of quicklime, slaked and mixed to a cream with three parts of water, is gradually added, with continued ebullition. The caustic solution is then decanted after settling, and boiled down rapidly with the access of air. From the residue pure caustic soda may be dissolved out by alcohol, which is then distilled off; but for most commercial, manufacturing, and medical uses the residue is merely melted and cast into sticks, which are preserved in bottles. Much caustic soda is also made by heating or boiling together the Greenland mineral cryolite with hydrate of lime. The compound is white, opaque, crystalline, and melts below incandescence. It is used largely, in the form of solution or soda-lye, for making soap.

Revised by IRA REMSEN.

Soda-ash: crude soda, as first produced before having gone through any refining processes. Previous to the French Revolution of 1789 the only source of the alkali-soda was from the ashes of marine and seashore plants, or kelp. The trade in kelp ceasing during the Revolution, the Committee of Public Safety in France called upon chemists to find some new source of soda, all the potash attainable being needed for gunpowder. Nicolas Leblanc, a surgeon and chemist, obtained the prize offered. His method consists in converting common salt first into sulphate by means of sulphuric acid, and then heating this together with charcoal and carbonate of calcium, which gives (theoretically) a mixture of carbonate of sodium and sulphide of calcium. This process is carried on, particularly in England, on an enormous scale in many large chemical works, all the soda used for making soap, glass, and a multitude of other products indispensable to civilization being thus procured. For details of the process reference must be made to the standard works on chemical technology, as, for example, the *Dictionary of Applied Chemistry* by T. E. Thorpe.

The crude soda-ash, sometimes called black ash, as it leaves the furnace is a very complex mixture of substances, containing chiefly, however, carbonate of sodium, caustic soda (hydrate), carbon, carbonate of calcium, and sulphide, or, according to some, oxysulphide, of calcium. It is treated with hot water or steam on a furnace-hearth to break it up, and then the carbonate is leached out with hot water in an ingenious apparatus contrived to accomplish much work with little water. The great defect of Leblanc's system as originally carried out was the loss of all the sulphuric acid or of the sulphur used in making it. Hence other methods of obtaining carbonate of soda from salt have been much sought after. One in successful operation, known as the Solvay or ammonia-soda process, consists of decomposing concentrated brine with a strong solution of bicarbonate of ammonia, which engenders chloride of ammonium and nearly insoluble bicarbonate of soda. The chloride of ammonium is readily reconvertible into bicarbonate, to be used over again. With respect to Leblanc's method, however, it may be noticed that by Chance's process, patented in 1888, the sulphur can be economically recovered from the exhausted black ash. Soda is manufactured to a limited extent from the Greenland CRYOLITE (*q. v.*). Revised by IRA REMSEN.

Soda-water: See AERATED WATERS and SOLUTION.

Sodium [Mod. Lat., from Eng. *soda*. See SODA]: one of the elements of matter, a very important and remarkable metallic substance which was first obtained in 1807 by H. Davy by the electrolysis of caustic soda (hydrate). Its occurrence in nature is chiefly as common salt (chloride of sodium) in the ocean, and as a constituent of silicates, chiefly the feldspars albite and oligoclase, on the land. It is also found in natron, an impure sodium sesquicarbonate, con-

taining besides sodium sulphate and chloride. A cubic foot of ocean-water contains about 6,440 grains, not far from 1 lb. avoirdupois, of metallic sodium, and a cubical tank 14 feet on each side filled with sea-water will contain more than 1 ton of this alkali-metal. A cubic foot of rock-salt contains over 52 lb. of sodium. Sodium is a metal probably more abundant in its occurrence than iron, and probably not necessarily much more difficult or expensive to obtain in approximate purity than the latter metal, and yet, by reason of the fewer uses developed for it, the cost of sodium is much greater than that of iron. Sodium is one of the elements most essential to animal life, being a constituent of all blood. It is also found in the vegetable organisms that dwell in the ocean and along its coasts, but plants dwelling on land above the sea-level contain potassium more abundantly than sodium.

Preparation.—Gay-Lussac and Thénard first prepared sodium in quantity by the action of metallic iron at an intense heat on fused caustic soda, but a much better method is that of Brunner, which consists in distilling a mixture of charcoal and carbonate of sodium, the transformation being essentially as follows:

a current of carbonic oxide gas resulting, which sweeps along with it the metallic sodium in vapor. The latter is condensed by passing the gases through a thin, flat cast-iron condenser of peculiar form, which becomes, and remains throughout, hot enough to prevent the metal from solidifying within it, and thus clogging it up. It is so contrived also that a sharp-pointed iron rod may be driven in through it into the retort to clear it out when in danger of choking up and thus leading to a dangerous explosion. The sodium trickles out of the condenser in melted form, and is prevented from taking fire and burning in the air by being received in a vessel of melted paraffin. The vessel should be double, each part having a close-fitting lid to be applied in case the paraffin should kindle. Care must be taken that the carbonate of sodium and charcoal are free from silica and phosphates, which energetically attack the iron of the retort and perforate it from the inside. Deville introduced the admixture of powdered chalk with the mass, to prevent its passing into liquid fusion, but this may introduce silicates, and an excess of coarsely powdered charcoal has been used instead.

A method for the preparation of sodium on a large scale has been devised by Castner. This consists essentially in the reduction of sodium hydroxide (caustic soda), by heating it with an intimate mixture of finely divided iron and carbon. The mass is prepared by mixing the iron with molten pitch, allowing it to cool, breaking it into pieces, and heating to a comparatively high temperature without access of air. The reaction is believed to take place as represented in this equation:

Sodium is a brilliant silver-white metal, of the softness of wax within the normal range of temperatures, but becoming somewhat harder at 20° below zero. It melts at 204° F., and has the specific gravity 0.972 at 15°. It crystallizes in octahedrons of the dimetric or tetragonal system. Its vapor, unlike that of potassium (which is green), is colorless. When exposed to the air, it rapidly absorbs oxygen, and moisture if present, forming either anhydrous oxide (Na_2O) or caustic soda (NaOH). When water touches it, there is an intense reaction, with evolution of hydrogen gas and caustic soda. If the quantity of water is small, the heat produced is so high that the metal takes fire, and burns with a yellow flame and high heat.

In the preservation of sodium it must be kept immersed under the surface of some liquid which is free from oxygen, the heavy oils of coal-tar being better for this purpose, apparently, than rectified petroleum, which seem to absorb oxygen slowly and transmit it to the sodium, which thus becomes soon encrusted with a product not yet examined. The addition of a small percentage of amyl alcohol to the oil prevents tarnishing of the metal.

Sodium Salts.—The most important salts or compounds of soda are the acetate, borate, carbonates, hypochlorite, hyposulphite, nitrate, phosphates, silicates, sulphate, sulphite, and tungstate. *Acetate of Sodium*.—This is a commercial article, prepared on a large scale by the manufacturers of wood-vinegar or pyroligneous acid. It is a white salt in prismatic crystals, which effloresce in the air, soluble in three parts of cold water. Heat converts it into a mixture of carbon and carbonate. It is used in medicine and as the source of com-

marial acids by distilling with sulphuric acid. *Uses of Sodium*.—Of these the most important is *Soda ash*. *Carbonates of Sodium*.—Of these there are two of great importance—the neutral or normal carbonate, commercially *soda ash* or *washing-soda*, and the bicarbonate, commercially *cooking-soda*. *Soda ash*, $\text{Na}_2\text{CO}_3 + 10\text{H}_2\text{O}$, crystallizes in large, transparent crystals, which are monoclinic. It is a salt efflorescent in the air very rapidly, falling down as a white powder, which contains but half as much water as before. If dissolved in twice its weight of cold water, and exposure to a gentle heat it loses all water, and becomes dry anhydrous carbonate. This latter is a product of enormous value in the arts, used chiefly in the manufacture of glass and soap. *Cooking-soda* [*sodium dihydrogen dicarbonate*], NaHCO_3 , is made by exposing the last compound to an atmosphere of carbon dioxide, which is absorbed, with evolution of heat and separation of water. It is sometimes called *soda saleratus*. Commercial bicarbonate of soda is a white granular powder, which requires thirteen times its weight of water for solution. It is largely used in medicine and in cooking. For *hypochlorite of soda*, or *Labarraque's liquid*, used as a disinfectant, see *HYPOCHLORITE*; *nitrate of sodium*, see *SALTPETER*, *CHILL*; *phosphate of sodium*, see *PHOSPHORIC ACID*; *nitrate of sodium*, see *GLASS*.

Sulphate of sodium, or *Glauber's salt* (q. v.), $\text{Na}_2\text{SO}_4 + 10\text{H}_2\text{O}$, forms large transparent monoclinic crystals. It occurs native in mineral springs, and as the mineral species *mirabilite*. Glauber's salt is highly efflorescent, falling to a white powder in the air, and in time losing all its water of crystallization. It dissolves in three times its weight of cold and in its own weight of boiling water. It has a remarkable propensity to form supersaturated solutions. For *sulphate of sodium*, see *SULPHURIC ACID*; *tungstate of sodium*, see *TUNGSTIC ACID*. Revised by I. A. REMICK.

Sodom [from Heb. *Sodam*, liter. burning, conflagration; Gr. *Sôdama*]; a city memorable in the earliest records of the Hebrews for its connection with Abraham and Lot, and the miraculous destruction by a storm of brimstone and fire (Gen. xiv. 24, 25). The exact situation of Sodom and its allied cities, Gomorrah, Admah, Zeloim, and Bela or Zoar, in the vale of Siddim, has long been discussed, the usual conclusion having been that the "cities of the plain" occupied the present basin of the southern bay of the Dead Sea, which was formerly supposed to have been burned at the time of the destruction of those cities. Geological examinations have shown, however, that the supposition is erroneous. The sea only underwent enlargement at that time. The shallowness of the southern end is an argument for locating the cities there. The catastrophe was not volcanic, but in consequence of the ignition by lightning of the asphalt with which the land is full, which would, of course, burn up the cities. The land sank when the asphalt had been burnt out, and then the Dead Sea overflowed the sunken ground. An earthquake may have been a contributing cause. On the southwest coast of the Dead Sea is Jebel Usdum (hill of Sodom), a mass of mineral salt. At the south end is a tall, isolated mass of rock, resembling a woman carrying a child. This is called Lot's wife. Josephus (*Jewish War*, iv. 8, 4) says that traces of the lost city still could be seen under the waters of the sea, and travelers have repeated the tale. The catastrophe itself, outside of the Bible and Josephus, is mentioned by Strabo (*Geography*, xvi. 2) and Tacitus (*History*, v. 5). Some locate the cities at the northern end of the sea, and employ a similar argument from the presence of asphalt there; and another argument is the supposed necessity of locating Zoar at the northern end, in order to justify the language of Gen. xiv. 9-12. SAMUEL MACAULEY JARVIS.

Sodium, Sea of. See DEAD SEA.

Suhl, Suhl, or Salsk: town, Westphalia, Prussia; junction of the Berlin-Düsseldorf railway. In the Middle Ages it was one of the most flourishing cities of the Hanseatic League. It is still a handsome town surrounded by substantial walls. The filled-up fosse forms attractive promenades. One of the old gates, the Ostthor, is a very curious piece of architecture and has been restored. The town has several important schools, a fine cathedral of the fifteenth century, and does a large trade in grain and cattle. Pop. (1870) 15,071. Revised by M. W. HAUGHSBORO.

Suhlberg, AUGUST, Ph. D., LL. D.: political economist; b. in Hamburg, Germany, Nov. 24, 1814; educated in Hamburg, Göttingen, and Berlin; syndic of the chamber of commerce of Hamburg 1840-72; became professor in Göttingen 1872.

He was an authority on coinage. His principal published works are *Lebensvoll Produktion und Werthvollkommen zwischen Geld und Silber und der Geldbewegung* (Austria) (Gotha, 1879) and *Literaturhistorie über Geld und Münzen insbesondere über den Währungsstreit, 1871-81* (Berlin, 1892). D. Dec. 23, 1892.

Sofala: a Portuguese settlement on the southeastern coast of Africa, in lat. 20° 11' S.; also an ill-defined flat coastal area from the mouth of the Zambezi to Delagoa Bay, comprising several Portuguese settlements (see map of Africa, ref. 4-6). The city of Sofala consists of a few mud huts, situated in an unhealthy salt-swamp; but the surrounding territory is very fertile, and it is only the Indians, warlike, and treachery of the native inhabitants which have hitherto impeded all progress. The low coast-land swarms with wild animals. Pop. about 1,300. M. W. H.

Sof'ias [from Turk. *safia*, from Pers. *sâfâsh*, liter. one who burns or is zealous]: persons attached to the service of the mosques. At Constantinople the term is specially applied to the whole body of theological students who receive instruction in the colleges (*medreses*) connected with the larger mosques. From them are recruited all ranks of the Mussulman clergy. Without ordination, but according to personal aptitude or length of study, each one is appointed to his special religious functions. At various times this body of students have taken a prominent part in political affairs. Thus prior to the Russo-Turkish war (1877) they caused the deposition of an incapable grand vizier and of an obnoxious sheik-ul-Islam. Their number at the capital is probably not much below 10,000. E. A. GROSSKOPF.

Soft-shelled Crab. See CRAB.

Sogdiana (in Gr. *Sogdiana*): formerly a territory of Central Asia, separated N. from Scythia by the Jaxartes, S. from Bactria by the Oxus; comprised nearly the same regions as the present Turkistan, the city of Bokhara still bearing the name of *Sogd*. It was conquered by the Persians under Cyrus, and fell after the death of Alexander the Great to Syria; it was subsequently conquered by the Turks.

Sohn, ALF. KARL FERDINAND: painter; b. in Berlin, Germany, Dec. 10, 1805; studied painting under Schadow, whom he accompanied in 1826 to Düsseldorf, in 1830 to Italy; was appointed professor in the Academy of Düsseldorf in 1838. D. in Cologne, Nov. 25, 1867. Among his most celebrated pictures are *Winnida and Arnold* (1827); *Diana and Acton* (1835); *The Judgment of Paris and Helen and Juliet* (1836); *Tasso and the Two Lovers* (1838); besides a number of portraits.

Sohrāb. See ROSTAM.

Sohst: See SOEST.

Solls: See AGRICULTURAL CHEMISTRY.

Soissons, *swā'sōn* (anc. *Nervodunum* and *Augusta Nervorum*): fortified town; in the department of Aisne, France; on the Aisne, 65 miles by rail N. E. of Paris (see map of France, ref. 3-F). It is an old but well-built city, with manufactures of cloth and hardware, and an important trade in grain. It has been the seat of a great number of very important synods, the most celebrated of which is that of 1191, which compelled Abelard to throw his writings into the fire. Soissons has been many times captured in war, the last time in 1870 by the Germans. Pop. (1891) 11,352.

Sejourner Truth: lecturer; b. in slavery in Ulster co., N. Y., about 1775; discarded the name Isabella given by her master for that of Sejourner, claiming that the Lord had bestowed it in a vision, adding the appellation Truth because that was the substance of the message she felt impelled to deliver to men; was held in bondage even after the abolition of slavery in the State; escaped to New York in 1827; subsequently removed to Northampton, Mass., and thence to Rochester, N. Y. Although illiterate, her force of character, shrewd wit, and impressive voice made her an effective speaker, and she traveled widely in the northern parts of the U. S., advocating general emancipation, women's rights, temperance, and political reforms. She spent much time in Washington, D. C., during the civil war. D. at Battle Creek, Mich., Nov. 26, 1865. See *Narrative of Sejourner Truth* (Battle Creek, 1845).

Sokoto: the largest of the HAUSA STATES (q. v.) in the Sudan, Africa; E. of the Niger river and S. of the Sahara Desert; separated from Lake Chad by the sultanate of Bornu. It is also known as one of the Fulbe states, because the

conquering Fulbe long ago imposed their rule and the faith of Mohammed upon this and other vast regions in the Sudan. It is one of the most densely populated parts of Africa. Trade and manufactures are well developed, particularly the fabrication of leather goods, cotton cloths, and weapons, but the chief industries are agriculture and cattle-raising. To Sokoto proper belong many tributary states and districts, the largest of which is Adamawa, S. of the Benue river, besides Yakubu, Saria, Kano, Muri, Katsena, and Samfara, all of which pay annual tribute to the sultan. Here the slave-trade flourishes. A small standing army, chiefly cavalry, is maintained. The capital, Sokoto, has only about 30,000 people, and is less important in population and trade than several other towns, notably KANO (*q. v.*). C. C. ADAMS.

Solana'ceæ: See NIGHTSHADE FAMILY.

Solan-goose: See GANNET.

Solanine [from Lat. *solanum*, nightshade]: a natural organic alkaloid found in the black nightshade, potato, bittersweet, and other species of *Solanum*. The alkaloids obtained from these different sources are probably not exactly the same. Solanine is a solid crystalline substance, readily soluble in alcohol. It is very poisonous, producing paralysis of the lower extremities before death, as has been seen in cattle poisoned by eating the green shoots of potatoes, which contain solanine largely. Revised by IRA REMSEN.

Solano: See SIMOOM.

Solanum [Lat., nightshade]: a genus of herbs and shrubs of the family *Solanaceæ*, most or all of which contain the poisonous principle solanine. The U. S. has several native species, mostly southern. There are a great many tropical species, some of them of great use in local therapeutics, though none is extensively employed in the medical practice of civilized lands except perhaps the *Solanum dulcamara*, or bittersweet. Several afford edible fruits, that of the egg-plant (*S. melongena*) being the most important. See NIGHTSHADE FAMILY. Revised by CHARLES E. BESSEY.

Solar Cycle: See CYCLE.

Sola'rio, ANDREA, da (called also *Andrea Milanese*): painter; b. at Solario, near Milan, Italy, about 1460. His method of painting indicates that he was influenced by Leonardo da Vinci, but nothing positive is known as to his teaching in art. He spent the years 1490-93 in Venice with a brother, Cristoforo, surnamed Il Gobbo (the hunchback), who was an architect and sculptor. In 1495 he had completed for S. Pietro at Murano an important altarpiece of a Holy Family with St. Jerome, now at the Brera at Milan. In 1507 he was decorating with frescoes for Charles d'Amboise the chapel of Château Gaillon in Normandy. Morelli supposes that Solario visited Flanders during the two years of his stay in Normandy, as his pictures have characteristics resembling those of the Flemish school. Andrea Solario died some time after 1515 while painting for the Certosa of Pavia an *Assumption of the Virgin*, now in the sacristy there. His best-known works are an *Ecce Homo* and a *Respose in Egypt* in the Poldi-Pezzoli Gallery at Milan, dated 1515; a *Vierge au Coussin vert*; a bust-portrait of Charles d'Amboise; a *Crucifixion* dated 1503; a *Head of John Baptist in a Charger* at the Louvre; and two portraits in the National Gallery of the London, both on panel. This painter is sometimes confounded with another Andrea di Milano, called Salai or Salaino, a pupil of Leonardo. W. J. S.

Solar Parallax [*solar* is from Lat. *sola'ris*, belonging or pertaining to the sun, deriv. of *sol*, sun]: the difference of the directions in which the sun is seen from the surface and center of the earth. (See PARALLAX.) The problem of determining the solar parallax is identical with that of measuring the distance of the sun, and has justly been called one of the noblest in astronomy. Attempts to estimate the distance of the sun were made even by the ancient astronomers Aristarchus and Ptolemy, but they were necessarily futile, since no observations they were able to make would measure so small a quantity as the parallax of the sun. Still they thought they measured the distance, and found it to be 1,210 radii of the earth. It is remarkable that even had the sun been as near as this, its apparent size would show its real diameter to be more than five times that of the earth. As soon as accurate observations were made with the telescope, it was found that the sun had no such parallax as it would have were its distance only 1,200 radii of the earth. At the time of Newton all that was known of the solar parallax was that it must be immeasurable with the instruments then at command.

To understand the modern solution of the problem, we must see how it presented itself to astronomers after the laws of the celestial motions were established. Imagine the sun with its retinue of eight large planets, the earth being one. As the earth revolves around the sun, astronomers see other planets in various directions, and can thus determine the annual parallax of each. In this way the ratios between the different orbits admit of very exact observation, and a more exact determination by Kepler's third law. Thus there is no difficulty in making a map of the solar system in which all the orbits shall be laid down on the same scale. Without any knowledge of the actual distance of the sun, it can be said that if the distance of the earth be represented by unity, then that of Venus will be represented by 0.72333, that of Mars by 1.52369, that of Jupiter by 5.2028, etc. It follows from this that if any one of these distances can be determined, or even the distance of Venus or Mars from the earth at any moment, all the other distances will follow, including that of the earth from the sun, just as the knowledge of a single distance on a map will give the scale of the map. It will also be readily understood that the nearer a planet comes to the earth the greater will be its parallax, and the more easily will its distance be determined. Moreover, observations on the position of a planet can be made with much more accuracy than on the sun. Thus French astronomers of the seventeenth century saw that if the apparent position of the planet Mars among the stars could be carefully observed from two distant points of the earth's surface, its parallax, and thus its distance, and the distance of the sun, could be determined. An expedition was sent for this purpose to the colony of Cayenne in South America, to make observations of the position of Mars during the opposition of 1672. Corresponding observations were made at the Paris Observatory. By a comparison of all the observations, Cassini computed the parallax of the sun to be 9.5". The error of this result is only about one-twelfth of its entire amount, so that this may justly be regarded as the first actual determination of the solar parallax. The corresponding distance of the sun would be 21,600 radii of the earth, or about 85,000,000 miles.

In 1849 Capt. James M. Gillis, of the U. S. navy, who was afterward superintendent of the Naval Observatory, made an expedition to Chili, for the purpose of observing the parallaxes of both Venus and Mars; but the two oppositions of Mars which occurred while he was there were not favorable, the planet being too far from the earth, and in addition to this the corresponding number of observations were not made in the northern hemisphere. No satisfactory result could therefore be reached.

Attempts to determine the parallax of Mars were not made between 1672 and 1849, because it was supposed that a much more accurate parallax could be determined by observations on transits of Venus. It occurred to Halley, the English astronomer, as far back as 1677, that the time required by the planet Venus to cross the disk of the sun in transit would be different at different parts of the earth, owing to the effect of the parallax of the planet. It was necessary, however, to wait nearly a hundred years for an opportunity of making such an observation, as no transit of Venus occurred from Halley's time until 1761. Then a transit occurred, and another in 1769. Expeditions to the southern hemisphere were sent out by various European nations, and these transits were observed wherever astronomers could see them. The results, however, were found to be much less accordant than had been anticipated, and the uncertainty of the observations thus shown was so perplexing that more than half a century elapsed before the results were definitively worked up. The German astronomer Encke, from an exhaustive discussion of all the observations, reached the conclusion that the sun's parallax was 8.5776", a result now known to be too small by about 0.20".

It is now found that the most accurate measures of the parallax can probably be made on the small planets between Mars and Jupiter. It is true that these bodies do not come so near the earth as either Venus or Mars, and the quantity to be measured is never so large as in the case of these planets; but this defect is more than compensated by the extreme accuracy with which the measures can be made. Dr. David Gill, astronomer at the Cape of Good Hope, has brought this method into use with great success.

Modern science has shown that there are other methods of determining the sun's distance and the dimensions of the solar system besides that of actually measuring the parallaxes of the planets. One of these consists in determining

the velocity of light. The phenomena of aberration show that there is a certain ratio between the velocity of light and the velocity of the earth in its orbit. This ratio is such that the velocity of light is a little more than 10,000 times that of the earth around the sun, and from this it follows that light takes about 495 seconds to pass from the sun to the earth. It follows that if it can be determined how many miles per second light travels, the distance of the sun can be at once obtained by multiplying this number by 495. This determination has actually been made with a high degree of precision. (See LAMÉ.) Unfortunately, the constant of aberration has not yet been determined with corresponding accuracy, owing to the inherent difficulties in the act of measuring so small a quantity, and especially owing to the fact that measures made six months apart have to be compared to determine it.

Yet a third method of determining the sun's distance is founded on the theory of gravitation. The action of the sun in changing the motion of the moon around the earth will be slightly different, according to its distance. The difference is such that an inequality of about two minutes in the motion of the moon arises from this cause; but this inequality is very difficult to determine from observation, because the measures have to be made near the first and last quarters of the moon. Owing to the different ways in which the light of the sun falls on the moon these measures are not strictly comparable with each other, and thus arises an uncertainty which has not yet been completely eliminated.

How numerous the attempts are to determine the distance of the sun in these various ways will be seen from the following résumé, which gives a synopsis of some of the principal astronomical results so far worked out.

In 1684 Horke published his celebrated works on the transit of Venus in 1761 and 1769, in which he concluded that the sun's parallax was 8.5776".

In 1844 Hansen found from the sun's action on the moon that Horke's parallax was too small. He did not reach a definite conclusion as to the exact amount of the increase until 1863, when he computed the parallax to be 8.916".

In 1858 Le Verrier, from observations of the sun, found that the parallax was 9.95".

In 1862 observations of Mars were made at several of the leading observatories in both hemispheres. From a comparison of some of these, Stone found a parallax of 8.843", and from those made at Padua and the Cape of Good Hope Winkler derived 8.964". The close agreement of these results with those of Hansen and Le Verrier led to a general belief among astronomers that the true value of the parallax was between 8.9" and 9.0".

In 1867 Newcomb discussed all the observations of Mars made in 1863, and combined with the result a revision of the methods of Hansen and Le Verrier. His conclusion was that in the then state of astronomy the most likely value of the parallax was 8.843". This result was so much smaller than others that it was received with distrust, but it was nevertheless adopted in the national ephemerides of the U. S., Germany, and Great Britain. In 1877, however, Gill, of England, made his well-known expedition to Ascension Island, for bolometer measures on Mars, from which he concluded that Newcomb's result was much too large, and that the true value was 8.78". About the same time Sir George Airy announced that the British observations of the transit of Venus in 1874 gave the surprisingly small result of 8.76";

In 1893, he redetermined the transit of Venus in 1761 and 1769, and found for the parallax 8.736".

In 1893 Harkness, from a general adjustment of astronomical observations, to which the parallax from the American photographs of the transit of Venus was included, concluded that the most probable value of the parallax, from all available data, was 8.733".

Toward the end of 1893, Auwers, from the American bolometer measures of the transits of Venus of 1874 and 1882, found 8.877".

Recent careful examinations of the data on which these results depend reduce their discrepancy, and lead to the conclusion that the value of the parallax is probably between 8.730" and 8.736". This gives, in round numbers, 69,000,000 miles for the distance of the sun, a result which is probably correct within 100,000 miles.

S. NEWCOMB.

Solar System: the sun and the bodies which revolve around it as their center of motion. The main features of this system are the great mass of the central body, which is between 700 and 800 times the total mass of all the bodies which revolve around it; the orderly arrangement of the principal bodies of the system, which revolve around the sun in a fairly regular progression of distances, and in nearly circular orbits; and the complete isolation of the system from all the other bodies of the universe, the nearest fixed star being about 9,000 times the distance of the farthest planet.

The bodies which compose the system may be classified as follows:

1. The great central body, the sun.
2. The four inner planets, Mercury, Venus, the Earth, and Mars.

3. A group of several hundred minor planets, or asteroids, revolving inside the orbit of Mars. It is impossible to say how many bodies there are in this group; the number known is more than 400. See ASTRONOMY.

4. The four outer planets, Jupiter, Saturn, Uranus, and Neptune. These, with the four planets first named, are called *major planets*.

5. Twenty-one satellites revolving around the planets, of which one belongs to the earth, two to Mars, five to Jupiter, eight to Saturn, four to Uranus, and one to Neptune.

To these may be added an unknown number of comets, which may, if we choose, be considered as belonging to the system; and numerous clouds of minute particles, invisible in themselves, the presence of which is made evident by their combustion when they strike the atmosphere, forming shooting stars.

Considering these bodies in the order of their masses and influence upon other bodies, the first place must, after the sun, be assigned to the eight major planets. The principal features of the orbits of these bodies are their approach to circles, and the fact that they lie nearly in the same plane. The most eccentric of their orbits is that of Mercury; yet the eye could scarcely distinguish its deviation from a circle, though it could readily perceive that the sun was not situated in the center of the circle. It is also the planet whose orbit is most inclined to the ecliptic, the inclination being 7°. See PLANET and ORBIT, and the names of the several planets.

The principal elements of the planetary orbits are shown in the following table:

TABLE OF THE PLANETARY ELEMENTS.

PLANET.	Apparent semi-dia.	Distance in miles.	Mean lat. to eq.	Time (year = 365)	Period of revolution.	Mean distance from sun.	Perihelion distance from sun.	Apoheion distance from sun.	Excentricity.	Longitude of perihelion.	Inclination to ecliptic.	Longitude of node.
					λ, μ, α	In astronomical units.	In astronomical units.	In astronomical units.				
Mercury	0.50"	9,000,000	none	1.12	88° 16'	0.387098	0.31	0.46	0.2056	77° 53'	7° 0'	48° 23'

S. NEWCOMB.

lat. Cape Turman, from a more auspicious discussion, afterwards raised the result to 8.813".

In 1861 Newcomb, from observations of the velocity of light, combined with Nyren's determination of the constant of aberration, reached the result 8.794".

Solder [(with / reinforced by analogy of Lat. *solidus*) from O. Fr. *solder*, to solder < Lat. *solidus*, **solidus*, make solid, faster, deriv. of *solidus*, *solidus*, solid]; an alloy employed to unite pieces of metal by fusion upon the proposed joint. There are many solders, each designed

for some special use. Three grades of solder are in common use: common solder, of equal parts of tin and lead; fine solder, of 2 parts of tin to 1 of lead; and a cheaper article, of 2 of lead to 1 of tin. The soft solders are usually of lead and tin, or lead, tin, and bismuth; these melt at a low temperature. The hard solders can not be melted at a low temperature; they are commonly of zinc and copper.

Sold Note: See **BOUGHT NOTE**.

Sole [viâ O. Fr. from Lat. *so'lea* (so named from its broad flat shape), liter., slipper, whence Eng. *sole* (of a shoe or of the foot)]: a flatfish of the family *Soleidae*. The common sole, *Solea solea*, has the scales ctenoid, the vertical fins not confluent, the pectorals of both sides developed; it is dark brown on its upper and white on its lower side, with the pectoral fin blackish at its end; it generally ranges between 10 and 20 inches in length, and between 1 and 10 lb. in weight, although the latter dimensions are rarely attained. It is found along almost the entire coast of Europe, and is one of the most esteemed of fishes; the flesh is white and firm, and is in season in all months of the year except the spawning-time, which takes place toward the end of winter. It is chiefly taken on the coasts of the British Islands by trawling. Several attempts have been made by the Fish Commission to introduce it into U. S. waters. Another species found on the British coast is the *Solea (Pegasus) aurantiaca*, or lemon-sole. *Achirus lineatus* of the Eastern U. S. is the nearest American ally of the European species, but this is more popularly known as the hog-choker, cover-clip, or calico; it is a worthless fish. In California several species of true *Pleuronectidae*—e. g. *Parophrys vetula*, *Lepidopsetta umbrosa*, *Psettichthys melanostictus*, and *Orthopsetta sordida*—are called soles. Revised by F. A. Lucas.

Sole'idæ [Mod. Lat., named from *Solea*, the typical genus. See **SOLE**]: a family of flatfishes (*Heterosomata*). The body is oblong or elongated, and nearly equally developed above and below the lateral line; the scales are small, or absent; the lateral line mostly straight (sometimes double or triple); the head small, and with a rounded projecting snout, and more or less hooked upper jaw; the eyes are approximated, and the upper is further forward than the lower; the opercula concealed by the scales; the mouth unsymmetrical, and rather small and curved; teeth generally confined to the blind side of the jaws, and villiform (sometimes wanting); branchial apertures restricted above; the dorsal begins on the snout, the anal under the pectoral fin; pectorals small or (in some genera) absent; ventrals small and variously developed. The vertebrae are very numerous, but unequally distributed, in the typical forms the abdominal or rib-bearing ones being only eight or nine in number, and the caudal about forty. The family is well distinguished by the physiognomy from the *Pleuronectidae*, especially so far as the European and American species are concerned, but some Australian types lessen the distance between them. Species are most abundant in the tropics, but are found in every sea except the extreme polar ones.

Revised by F. A. Lucas.

Solemn League and Covenant: See **COVENANT, NATIONAL**.

Solenocoen'chæ [Mod. Lat.; Gr. *σωλήν*, channel, pipe + *κόγχη*, shell]: the *Scaphopoda*, or tooth-shells, in allusion to the tubular nature of the shell. See **MOLLUSCA**.

Solenogas'tres [Mod. Lat.; Gr. *σωλήν*, channel + *γαστήρ*, belly]: an order of shell-less molluscs, embracing a few forms from the deep seas. They are of interest to zoölogists as being very simple and primitive forms. See **MOLLUSCA**.

Solenog'lypha [Mod. Lat.; Gr. *σωλήν*, channel, pipe + *γλῶφειν*, curve, cut]: a sub-order of snakes. The maxillary bones are excessively shortened, and thereby assume a vertical aspect, and are thus adapted to support the venom-fangs; the fangs (except in *Causus*) are competely tubular; the pupils of the eyes are generally erect and elliptical; the occipital region is scaly. The sub-order includes the most poisonous and dreaded snakes of America; some equally dangerous in the Old World belong to the sub-order *Proteroglypha*. By Cope four families are recognized—viz.: (1) *Crotalidae*, including the rattlesnakes and copperheads; (2) *Viperidae*, typified by the vipers of Europe and Africa; (3) *Causidae*; and (4) *Atractaspidae* of Africa.

Revised by J. S. KINGSLEY.

Solenne, *sō'lēr'* (Germ. *Solothurn*): canton of Northwestern Switzerland; area, 302 sq. miles. The surface is cov-

ered by offshoots of the Jura Mountains, which here are very rich in iron and marble. The soil is fertile, and produces more corn and wine than is demanded for home consumption. The rearing of cattle, sheep, and swine is extensively carried on. Manufactures are confined to iron goods, glassware, and watches. Pop. (1888) 85,621, of whom 74 per cent. were Roman Catholics and the rest Protestants; they all speak the German language. The chief town is Soleur (Lat. *Solodurum*); pop. (1888) 8,460.

Solfegglo: See **SOLMIZATION**.

Solferino, *sōl-fā-ree'nō*: village of Mantua, Northern Italy; celebrated for the battle in which the French, under the command-in-chief of Napoleon III., and the Sardinians, under Victor Emmanuel, utterly defeated the Austrians (June 24, 1859) (see map of Italy, ref. 3-C). It was the decisive battle of the war of Italian independence. The forces of the allies numbered about 150,000, while the Austrians brought about 170,000 into the field. After their defeat the latter retreated toward Verona and left all Lombardy open to the allies. Napoleon, not caring to attack the strong position that the Austrians held in the Quadrilateral, concluded the truce of Villafranca.

Soli: See **CILICIA**.

Solicitor [in form viâ O. Fr. from Lat. *sollicitator*, deriv. of *sollicitare*; in meaning deriv. of Eng. *solicit* (in its legal sense), from Lat. *sollicitare*, urge, entice; *sollus*, whole + *ciere*, *ci'tum*, move]: in Great Britain (under the present statutes), an officer of the Supreme Court of Judicature who, and who only, is entitled to sue out any writ or process, or begin, or carry on, solicit, or defend any action or other proceeding in any court, his official title being solicitor of the Supreme Court.

Formerly the term solicitor was applied only to those who conducted such business in the court of chancery, the corresponding terms in the common-law courts being **ATTORNEY** (*q. v.*), and in the ecclesiastical and admiralty courts **PROCTOR** (*q. v.*); but it was the general practice to be admitted both as solicitor and attorney. The Scotch term corresponding to solicitor is *law-agent*, and the act regulating the admission to practice the privileges, etc., of law-agents is the Law-agents' Act, 1873 (36 and 37 Vict., c. 63). The solicitor is distinct in Great Britain from the counsel or barrister (called advocate in Scotland), not only as to the work performed by him for his client, but also as to the requirements for his admission to practice and his relations to his clients. These matters are minutely regulated by statute.

The Solicitors' Act of 1843 provides that with certain exceptions no person shall be admitted as solicitor or attorney unless he has served as an articulated clerk for five years to a practicing attorney or solicitor, or in case of a person having a university degree three years, or has been previously admitted to the bar, or has been ten years clerk to an attorney previous to being articulated. No solicitor is allowed to have articulated clerks except when practicing, nor more than two at any time; and the clerk may not engage in any other employment without the consent in writing of the solicitor and the sanction of a judge of the high court. Examinations must be passed at times and upon subjects fixed in accordance with statutes.

A solicitor, unlike a barrister, is liable to his client for negligence in the conduct of his case; and may sue his client for his remuneration, and has a general lien for his costs on his client's papers. The remuneration of solicitors in conveyancing and other noncontentious business is fixed by law with "reference to such matters as the amount of money to which the business relates, and the skill, labor, and responsibility involved on the solicitor's part." He, being an officer of the court, is subject to the summary jurisdiction of the court for professional misconduct, etc.

Solicitors can not practice as advocates in the upper courts, but may before magistrates at petty sessions and quarter sessions where there is no bar, in county courts, at arbitrations, at judges' chambers, coroners' inquests, revising barristers' courts, under-sheriffs' and secondaries' courts, and the court of bankruptcy. He must, under a considerable penalty, take out a yearly certificate authorizing him to practice. See Cordery's *Law Relating to Solicitors* (2d ed. London, 1888); Turner's *Duties of Solicitor to Client* (London, 1884); Begg on *Law Agents*. F. STURGES ALLEN.

Sol'idus: the later Latin name for the Roman gold coin called *aureus*. It received this name first in 296 when Diocletian reformed the currency, and it retained its full weight

and part 27, seventy-two being struck to the pound, as long as the empire lasted. It was adopted by the Franks, under the Merovingians and Carolingians, but was superseded by Denarii. Afterward a solidus of silver (*solidus argenteus*), which weighed one-twentieth of a pound, was coined. Three or four times, under the name of solidus, out of use, underwent a number of changes in composition and value. In 1794 the coin was abolished in France, but the name has been retained by the equivalent coin of five centimes. The *solidus*, a coin formerly struck in some parts of Italy, and generally of about the same value as a sou, is also, in name at least, an historical representative of the solidus. In the Middle Ages the solidus denoted a money of account, and was translated into the Teutonic languages by the word *schilling* in its equivalent. It then survives in the abbreviation *s.* of £ s. d.

Solifugae [from Lat. *sol*, sun & *fu-gere*, flee, fly]: a group of spider-like animals, in which the head is distinct from the thorax, and the abdomen is elongate and plainly segmented. The body is usually densely haired. The first pair of appendages ends in large pincers, the second pair are leglike. These animals, which live in the warmer parts, and especially the desert portions, of both hemispheres, breathe by means of tracheae. They have the name of being very poisonous, especially in the Old World, and are correspondingly feared. There are about sixty species, distributed among some fifteen genera, of which *Solpuga* and *Gobulus* are best known. J. S. KIRKLEY.

Sollimões, *sô-lô-môis*, or **Sollimoens**, *sô-lô-môis*: the Brazilian name for the middle Amazon, from the Peruvian frontier to the junction of the Rio Negro. It was originally the name of an Indian tribe. See **AMAZON**.

Solingen: town of Rhinisch Prussia; 16 miles E. of Düsseldorf; famous for its manufactures of iron and steel goods, especially sword-blades, in the Middle Ages, and still an important center for such manufactures, especially of cutlery and small arms (German Empire, ref. 4-1). In the district are about 3,700 metallurgical establishments, which employ 39,000 workmen. In the town, besides the large factories, there are 3,000 small forges and shops. Pop. (1890) 16,540. Revised by M. W. HARRINGTON.

Soll's, (LUDWIG JULIUS (named GRAMMATICUS); historian: lived in the first half of the third century, and wrote *Collectanea Rerum Memorabilium Polyhistor*, in which he gives a brief sketch of the world as it was known to him, accompanied with historical notices and remarks on the origin, habits, religious rites, and social conditions of the various nations. The greater part is derived through an intermediate source from the *Natural History* of Pliny and Pomponius Mela, and has no independent value. In the Middle Ages the book was much read. There are editions by Salmasius (1696) and by Mommsen (Berlin, 1864), and an English translation by Golding (1887).

Revised by M. WARRICK.

Solis, *sô-lis*, JUAN DIAZ, the navigator; b. probably at Lebrija, Andalus, Spain, about 1450. Of his early voyages nothing definite is known, but Varnhagen considered it probable that he was on the Brazilian coast with Gonzalo Coelho to 1500. In 1500 he was associated with Vicente Yañez Pinzon in an exploration of the coasts of Honduras and part of Yucatan; and in 1508, again with Pinzon, he followed down the eastern side of South America to lat. 40° S., entering the Bay of Rio de Janeiro, and passing the Plata without exploring it. In 1512 he was appointed chief pilot of Spain, commanding Yaguer. In this capacity he was employed to seek a southwestern passage to the East Indies, sailing from Laga with three vessels in Oct., 1513. Entering the Plata, he explored it for some distance, but, landing on no island, was killed by the Charras Indians; the ships then returned to Spain. The Plata was for some time called Rio de Solis, though it is probable that Solis was not its first explorer.

HERBERT H. SMITH.

Solis y Bihadeneyra, *se-ris-lis-dâ-nâ-i-râ*, ANTONIO, the author; b. at Alcala de Henares, Spain, July 18, 1610. He studied law at Salamanca, and early became known as an author of poems and dramas; these brought him the friendship of Calderon, and the protection of the Count of Oropesa, who made him his secretary; later he was chief clerk of the Secretary of State, and in 1654 was made secretary to Philip IV. In 1690 he was appointed historiographer of the Indies; soon after he took orders, and his subsequent writings are mainly on historical subjects. His fame rests

principally on the *Historia de la Conquista de Mexico* (1664), which is one of the Spanish prose classics, and was translated into French, Italian, and English. Aside from its literary merits it shows little profundity of research, and is distinguished by imagery and by the long imaginary speeches of the principal characters. It is the first connected history of the conquest. D. in Madrid, Apr. 19, 1686. H. H. S.

Solitaire, *sô-lî-târ* [= Fr. *litt.*, solitary = Lat. *solitarius*, deriv. of *solus*, alone]: the *Psephenus solitarius*, a bird related to the Doves (q. v.), formerly inhabiting the island of Rodriguez. Francois Leguat, who was one of a colony of Huguenots who settled on the island in 1691, describes the solitaire in his *Voyages et Anecdotes*, and gives a wood-cut representing it. Numerous remains of the solitaire have been found. It was larger than the turkey, and did not use its wings for flight. It was a slow runner and defended itself with its wings and beak. Its flesh was good to eat.

Solmization, **Solfeggio**, or **Solfing** [*solmization* is from Fr. *solmisation*; *sol* + *mi*, notes of the scale; *sol-feg-gio* = Ital. deriv. of *solfis*, the scale; *sol*, *sol* + *fa*, *fa*): in music, the art of giving to each of the seven notes of the scale its proper sound or relative pitch. The acquiring of a true intonation of the scale, first by regular gradation upward and downward, and then by skips from one degree to another, is an object of primary importance in vocal music. To facilitate this, various expedients have been devised, but chiefly the association of the several sounds with articulate utterances, such as the numerical words, *one, two, three*, etc. Many centuries ago certain syllables, void of any special meaning, but containing the several vowel-sounds, were selected for this purpose, and are in general use. See **CLAVE**. Revised by FRANKY REED.

Solmo'na (Lat. *Salsina*): town; in the province of Aquila (reg. Abruzzi, Italy); in the plain S. W. of Chieti (see map of Italy, vol. 5-15). The cathedral and the Church of the Antonian are noteworthy. It is the birthplace of Ovid; Pop. 14,170.

Sol'mon [from Heb. *Shlomo*, *litt.*, peaceable]: the son and successor of David, King of Israel. His name was given with reference to the peace which it was promised, should attend his reign (1 Chron. xxi, 7-10). As the recipient of Jehovah's special promise to the eternal line of David (2 Sam. vii.) he was also named Jedidiah, beloved of Jehovah (2 Sam. xii. 24, 25). His mother was Bathsheba, who had been the wife of Uriah, his birth occurring a considerable time after David's repentance for that worst of sins, his conduct in the matter of Uriah. In 1 Chron. xxi, 1-xxix, 28a is an account of Solomon's being made king, followed (verses 22b-25) by an account of his being made king "a second time," this second account being clearly a condensation of the narrative in 1 Kings i. Apparently the first coronation occurred at or near the close of the fortieth year of David (his last year but one), and just before the outbreak of Absalom's rebellion (1 Chron. xxvi, 31; 2 Sam. xv. 7). At all events this interpretation gives a consistent meaning to the biblical data, while the different interpretation commonly received makes them inconsistent and unintelligible.

Solomon began his reign humbly and wisely, asking God for wisdom, which was granted. In his fourth year he began his great work, "the house of the Lord," for which David had laid plans and accumulated enormous treasures. It was completed and dedicated seven years later. This was but the beginning of his achievements as a builder. Among the structures attributed to him are his own palace, "the House of the Forest of Lebanon," and his wonderful throne, together with cities, fortifications, stations for commerce, reservoirs, and aqueducts. He also engaged in handicraft and in landscape-gardening. He peacefully consolidated the kingdom which his father had conquered. He reorganized and enlarged the civil service of David. He started the hitherto pastoral or agricultural Hebrews on the new road of commerce, sending ships to "Ophir," India, and Arabia in the East from the new-built port of Ezion-geber on the eastern arm of the Red Sea, and from Jaffa and Tyre, westward to "Tarshish" in Spain. Many kings were his tributaries; untold wealth and the wonders and curations of many countries flowed into or through the land. Many foreigners were attracted by his splendor and wisdom, notably the Queen of Sheba, with her numerous retinue. His harvest grew to number 1,000 inmates, and thus to accord with Oriental ideas of his royal magnificence. He appears as a person of fascinating beauty and grace, impetuous,

generous, sympathetic, and at first humble; of fine humor and noble intellect, a man of broad views, a far-sighted statesman, most learned in the science of the day. He was an organizer of splendid executive powers, a great builder and artist, poet, philosopher, and had from the Lord pre-eminently "an understanding heart to judge." Unfortunately, there is another side to the picture. From motives of state policy Solomon married the daughter of Pharaoh of Egypt and many other wives from among the princesses of his tributary kingdoms. This led to latitudinarianism in religion, to extravagance in public expenditures, to oppression and disregard of human rights. The result was that his reign was partly a failure. Before his death Edom and Syria revolted and Jeroboam raised rebellion in Northern Israel. After his death the ten tribes revolted, so that the strictly Israelite portion of his kingdom was divided, while the tributary peoples fell away from their allegiance.

ISAAC RILEY. Revised by W. J. BEECHER.

Solomon ben Gabirol (Arab. *Abu Ayyūb Sulaimān ibn Gabirol*; Lat. *Abi-gebrol*, *Avicembrol*, *Avicembro*): Jewish philosopher and poet; b. in Cordova, Spain; lived for a time at Saragossa; d. about 1041. His chief poem is the hymn *Kether Malkuth* (Crown of Royalty), a philosophical explanation of Jewish doctrine. His chief prose work, written in Arabic, is the *Source of Life*, in which "the theories of Plotinus are developed and the will plays a part almost as it does in the system of Schopenhauer." This work was freely used by Christian writers in the Middle Ages; the discovery of the identity of the author with Gabirol was made by Munk. Gabirol also wrote a work on ethics. See Steinschneider, *Hebr. Uebersetz. im Mittelalt.* (vol. i., § 219); Stössel, *Sol. ben Gabirol als Philosoph* (Leipzig, 1881); Dukes, *Solomon ben Gabirol* (Hanover, 1880); Guttman, *Die Phil. des Ibn Gabirol* (Göttingen, 1889).

RICHARD GOTTHEIL.

Solomon ben Isaac: See RASHI.

Solomon (Germ. *Salomon*) Islands: an extensive archipelago E. of New Guinea, from which it is separated by the Bismarck Archipelago and Louisiade islands. It extends in a line S. E. and N. W. from about lat. 4° S., lon. 154° E., to lat. 12° S., lon. 162° E., and consists of seven large islands and very many small ones. The islands forming the northern half of the archipelago were taken under German protection in 1886. The largest of these are Bougainville (pop. 10,000), Choiseul (5,850), and Isabel (5,840). The total area of the German Solomon islands is 8,708 sq. miles, with a pop. of 89,000. The remainder of the archipelago has an area of 8,357 sq. miles and a population of 87,000. It was brought within the British protectorate in June, 1893. The inhabitants are Papuan and Polynesian, the latter living especially on the smaller islands, where the population is often very dense. They are intelligent, quick, and crafty, but make good servants, and are in demand on the Bismarck Archipelago as laborers. They are cannibals; their weapons consist of the bow and arrow, spear, and club, which are all characterized by fine finish. Their canoes are the finest in the Pacific. The islands are essentially volcanic, but are surrounded by coral reefs. They were discovered in the sixteenth century, but were lost sight of until 1767, when they were rediscovered by Carteret. They are still the least-known group of the Pacific. See *Voyages* of Dalrymple, Hawkesworth, Fleurien, Labillardière, Dumont d'Urville, Brenchley, and Wood; Wallace, *Australasia*; and Woodford, *A Naturalist among the Headhunters* (1890).

MARK W. HARRINGTON.

Solomon, Song of: See CANTICLE.

Solomon's-seal: any one of the liliaceous herbs of the genera *Polygonatum*, *Vagnera*, and *Unifolium*. They are found in Europe and North America. The roots are popularly esteemed as a vulnerary, and have some use in domestic medicine. The name properly belongs only to the species of *Polygonatum*; the "seal" is the circular depressed scar left on the root-stock by the death and separation annually of the flowering stem. The common Solomon's-seal, *Polygonatum multiflorum*, is found in woods and copses in many parts of England, and also in a few places in Scotland. It has a stem about 2 feet high, the upper part of which bears a number of large, ovate-elliptical, alternate leaves in two rows. The flower-stalks are generally unbranched; the flowers, which are not large, are white and drooping.

Solomon, Wisdom of: See WISDOM, BOOK OF.

Sol'on: statesman, sage, and poet; the son of Execestides; filled the office of first archon in Athens (Ol. 46, 3; B. C. 594), and in that capacity established there the constitution framed by him. He is the noblest representative of the many-sidedness which distinguished the Athenian more than all other Hellenes. An Eupatrid by birth, he engaged also in trade and commerce by sea. By this means it was possible for him, after finishing all exercises, as well in music and poetry as in gymnastics, to become acquainted with the entire coast of the Archipelago. It was a time of fermentation in society; Psammetichus had opened the Nile region to the Greeks (B. C. 606); the first money had been coined in Ægina; navigation took all at once a gigantic stride forward; young adventurers gained in a few years great riches, and those parts of the communities engaged in trade took form as a new middle class, and stood defiantly opposed to the ancient families; property in land was outstripped by movable capital; around Athens on all sides—in Argos, Corinth, Sicily, Megara—the old system of things had been broken, the ruling families had been overthrown, and through the downfall of the constitutions single tyrants had come to power, who shone by their riches, employed mercenary troops, and pursued a narrow policy of self-aggrandizement. In this revolutionary time, spite of all splendor, the best possessions of the nation were endangered—namely, the free citizen class and the sovereign authority of the law. For this reason Solon deemed it the work of his life to give his native city the benefit of all progress in culture which the times offered, without causing her to break with the past and be exposed to the deplorable evils connected with a revolution. A written criminal code, such as Dracon had issued (B. C. 621), was not able to supply the want; a thorough, peaceful reform of the state was needed, which should reconcile the differences which tore the communities asunder. For a moral and political renovation of the state was needed more than all else a vigorous self-consciousness. The Athenians, however, were feeling depressed; Megara held possession of Salamis, and was consequently mistress of the sea; the Athenians were like captives in their own land, and in deep despondency had renounced their own islands on the coast. Inflamed by Solon's inspiring poetry, they conquered Salamis (about 604). This was a turning-point for the history of Greece. From that day Megara sank, and Athens resisted power.

Solon was the first man in Athens; he was at liberty to secure for himself absolute power for life, but it was his firm resolve to accomplish his purpose without any violation of law. As recognized mediator between all parties, and solely by the force of his genius, his impressive words, and his pure personality, he carried out the most important reforms, applying them to the evils of society at the very root. The radical evil was that the small landowners were hopelessly in debt. Owing to a hard debtor-law, they forfeited even their freedom; a wretched proletariat was thus formed, and the land fell more and more into the hands of the great capitalists. Solon caused Athens to alter its standard of coinage (probably after the example of Corinth) by adopting also for silver the Euboean gold standard. The result was a lighter drachma, in which debts could be legally paid, so that the poor obtained a relief of 27 per cent. Other measures of alleviation were also introduced: the debtor-laws were made milder, and fixed limits set to the acquisition of large estates; and the surprisingly great success of this legislation (*Seisachtheia*) in lightening the burdens of the people is most plainly attested by the glorious poem of Solon, in which he calls Mother Earth to witness that she has been happily freed from the burden of many pawn-pillars (which were set up in the ground as tokens of alienated lands). Then followed the great political reform—the conversion of the state, ruled by families, into a timocracy. It seemed to the noble families only a new guaranty of their privileges that none could hold office as archons except the members of the first class, the Pentakosiomedimni (with a minimum of 500 bush. of barley net income, corresponding to a taxable capital of 6,000 drachmæ or one talent), while the citizens of the second class, the knights, with 300, and those of the third (*Zeugitai*), with 150 medimni as minimum of each year's income, had access to the council and to the remaining offices. The mass of the people, the Thetes, who did not belong to the three classes, could not become members of the council nor fill any office, but took part in the public assemblies. No one

therefore, was excluded from public life, and even the poorest helped frame the laws which he had to obey. The personal life of the first citizens was no longer dependent upon birth, but could be fulfilled by a careless domestic economy, and won by others through industry. The free for agriculture was encouraged, the worth of landed property was increased, and even commoners could take full share in the management of public affairs if they reached the degree of prosperity which seemed necessary for the attainment of culture and independent leisure. In law, the important reform was carried through that the common people no longer consider final decision in courts, but that appeal to the commonwealth could be made in every case. The statutes by which the sacred, public, and private law was administered were inserted on wooden frames with space for free sales, and brought to the notice of all. On public life also the laws took a firm hold: they emancipated the citizen from the family; they gave to the head of every household the free disposal of his acquired property; they showed the value of good parents on their children for maintenance only on the condition that they had given them a careful education; they checked the luxurious adornment of tombs and extravagant display in the dinner for the dead.

In all his reforms Solon's purpose was to purify the public morals, banish all barbarous influences, and bring to perfection whatever was peculiarly Hellenic. He united religion, state, and home in a harmonious whole; every citizen was made responsible for the commonwealth, and on the other hand the prosperity of the state was based upon the stability of the family. The legislation of Solon is the greatest work of an unshaken political wisdom has produced, the earliest expression of the Athenian consciousness—a work based upon the needs of the time, inasmuch as Solon gave a place in his laws to whatever of good had struggled to the light in the time of the tyrants, while he avoided violence and lawlessness like theirs. It is true that Solon's external success was slight, and he himself was to live to see a tyranny in Athens, but his laws remained in force; they protected the city like a palladium, and up to the latest times the Athenians found their better self in Solon's law.

About the decisive year of 684, during which he ruled Athens with dictatorial power, Solon is said to have traveled ten years in foreign countries. Solon lived retired in Athens until his death about O. 55, 2) 559 B.C., surrounded by a number of pupils, of whom Mimantides, the teacher of Theophrastus, was one.

Revised by J. R. S. Smeaton.

Solar: an island of the Malayan Archipelago, off the eastern extremity of Flores, in lat. 8° 47' S., lon. 123° 8' E. Area, 106 sq. miles. Pop. 15,000, mostly engaged in fishing and trading. Sulphur and edible birds' nests are the principal articles of exportation. The inhabitants are Malays, partly Mohammedans, partly Christians. The name is also applied to the small archipelago to which this island belongs. It contains two other large islands—Adonara and Larakelau. Area of the group about 1,250 sq. miles. Pop. variously estimated at from 40,000 to 180,000.

Solo'yev, Sergei Mironovich; historian; b. in Moscow, Russia, May 3, 1829; d. Oct. 4, 1879. During his life he was connected with the University of Moscow, where he studied, taught, and in 1871 was made rector, but resigned in 1877, owing to difficulties with the authorities. His writings are numerous; his *History of the Relations between the Russian Princes of the House of Rurik* (1847) laid down the principles of the modern school of historians just coming to form themselves; his *Historical Letters* (1856), his *History of the Fall of Poland* (1863), his *Scholarship of Russian History* (1864-65), and others are of value, but his great work was his *History of Russia*, begun in 1851. He lived to complete twenty-nine volumes, carrying it down to the year 1714. It is a mine of information, clear and impartial, but needed for popular use.

A. C. COOLIDGE.

Solution (Fr. O. V., from Lat. *soluere*; sol, sun + *luere*, to wash, dress, of *solis*, of *sol*, sun, stand, stand up). The indication of the earth's equator to the solstice or plane of its annual motion about the sun is the same that we have in dividing half the year on the northern polar side of the equator, the other half on the southern, causing the vicissitudes of summer and winter in the respective

hemispheres. The distance from the sun N. or S. of the equator has direct effect on the constantly varying. The two points at which this apparent northern or southern motion ceases (or at which its progressive increase or diminution appears to be arrested) are the summer and winter solstices. At these periods the day is the longest or shortest, according as the earth is in the summer (June 21) or winter (Dec. 21) solstice. See EQUINOX.

Solution (from Lat. *soluere*, *soluere*, *soluere*, sol, sun, dissolve, and *soluere*, dissolve); the liquid product formed when a solid, a liquid, or a gas dissolves in a liquid. Thus when water is poured upon salt or sugar the solid substance disappears as such and passes into the liquid form. Any liquid which has the power to dissolve a substance is called a solvent, and the substance is said to be soluble in the liquid. Water is used as a solvent much more generally than any other liquid, both because it is a common substance and because it dissolves many things. Alcohol is also much used, especially in the preparation of solutions for medicinal purposes. The so-called tinctures are such alcoholic solutions of constituents of plants which have value as remedies. Besides water and alcohol many other liquids, perhaps all liquids, have the power to dissolve other things, and some of them find employment for this purpose.

Liquids not only dissolve solids, but other liquids and also gases. Some liquids mix with one another, or, in other words, they dissolve one in the other. This is true, for example, of water and alcohol, which dissolve in all proportions. Other liquids, however, act differently. Thus water, as is well known, does not dissolve oily liquids. Ether and benzene, on the other hand, do dissolve oils. Some gases dissolve in water to a very remarkable extent. Thus water at about freezing temperature has the power to dissolve 1,000 times its own bulk of the gas ammonia. Water also dissolves carbonic acid gas, and all natural waters contain some of this gas in solution. These waters also contain ordinary air in solution. When a liquid is placed in a closed vessel, and gas forced into it by means of a pump, it dissolves more, and more gas as the pressure increases, and when the pressure is removed—that is, when the vessel is opened—the gas passes rapidly out of solution, giving rise to the phenomenon known as effervescence. This is most commonly seen in the case of soda-water, which is a solution of carbonic acid gas in water under pressure. When the water is drawn out into the air the gas escapes.

In a solution, whether of a solid, a liquid, or a gas, the dissolved substance is uniformly distributed—that is to say, there is as much of it in one drop of the solution as there is in any other drop. A drop of a concentrated solution of the dye magenta brought into many gallons of water imparts a distinct color to all parts of the liquid. An experiment of this kind gives some idea of the extent to which the division of matter can be carried, for it is evident that in each drop of the dilute solution there must be contained some of the dye, though the quantity must be minute beyond our powers of imagination. While there seems to be no limit to the extent to which a solution can be diluted, and still retain the dissolved substance uniformly distributed through its mass, there is a limit to the amount of every substance that can be brought into solution in any given solvent. Some substances are easily soluble; others are difficultly soluble.

Little is positively known in regard to the nature of solution. There are facts that indicate that the particles of the solvent form unstable compounds with the particles of the dissolved substance. In some cases, further, it appears that the act of solution involves a complete breaking down of the dissolved substance. The subject is being actively investigated. Consult *Solutions*, by W. Ostwald, translated by M. M. P. Muir, 1891.

See SOLUBLE.

Solway Firth: an inlet of the Irish Sea, 31 miles long, from 24 to 30 miles broad; it separates Cumberland from the south of Scotland. It is noted for the gentleness and strength of its ebb and flow, the spring tide rushing in with a wave from 4 to 6 feet high, and with a speed of from 8 to 10 miles an hour. It receives the E.4., the Derwent, and several minor streams.

Solymna: same as SOLEMAN (q. v.).

Somal Coast: an ill-defined area occupying the eastern horn of Africa, and extending along the Gulf of Aden and the Indian Ocean from Zela, in lat. 11° 18' N., to the mouth of the Jub. in lat. 0° 14' N.; claimed by the British (along the Gulf of Aden) and the Italians (along the Indian Ocean & to British East Africa); area of the former part about

75,000 sq. miles. By an arrangement of the British and Italian governments in 1894 the limits of their protectorates were strictly defined. It is mountainous, rich in myrrh and incense, and inhabited by tribes related to the Abyssinians and Gallas, mostly nomads and ill famed on account of their savage and predatory habits. The principal port is Berbera, in lat. 10° 23' N. It has an excellent harbor. During the hot season it is deserted, but in winter comprises a population of about 30,000 people, who gather to exchange the products of their industry. See James, *The Unknown Horn of Africa* (2d ed. 1890). Revised by M. W. HARRINGTON.

Somatology [Gr. *σῶμα*, *sōma*, body + *λόγος*, *logos*, discourse, reason]: the science of living organized bodies as far as relates to material conformation and not to psychological phenomena. Thus it is included within biology. In a limited sense it is applied to the science of the human body, when it is equivalent to human anatomy and physiology. The name somatology has also been given to the study of inorganic bodies, in which case it does not differ much in signification from physics. See ANTHROPOLOGY.

Sombrerete: town of the state of Zacatecas, Mexico; 100 miles N. W. of Zacatecas (see map of Mexico, ref. 5-F); 8,432 feet above the sea. It is noted for its silver mines. The celebrated "black vein" of Sombrerete was formerly said to yield the richest ore in the world. The town had a mint in 1810-12. Pop. about 9,000. H. H. S.

Somers, JOHN, Lord: statesman; b. at Worcester, England, Mar. 4, 1651; educated at Trinity College, Oxford; studied law at the Middle Temple; called to the bar 1676, but remained at Oxford, engaged in classical, historical, and juridical studies; translated from classic authors and wrote pamphlets in vindication of the exclusion of the Duke of York from the succession and in defense of grand juries (1681); began legal practice at London 1682; soon became a leader of the Whigs; one of the counsel for the seven bishops 1688; sat as member for Worcester in the Convention Parliament Jan., 1689; was chairman of the committee which drew up the Declaration of Right; was made successively Solicitor-General, Attorney-General, Lord Keeper of the Great Seal, and in 1697 was appointed Lord Chancellor and raised to the peerage. His fidelity to William III. exposed him to frequent attacks, one of which resulted in his removal from the chancellorship Apr. 17, 1700, and another caused his arraignment for trial before the House of Lords with a view to impeachment on fourteen very miscellaneous charges Apr. 1, 1701, but the prosecution was withdrawn June 17, 1701. He recovered his influence at court; was chosen president of the Royal Society 1702; drew up the plan for the union of the crowns of England and Scotland 1706; became president of the council Nov., 1708, and resigned 1710. D. in London, Apr. 26, 1716. A valuable collection of state papers, known as the *Somers Tracts*, was edited from originals in his library (16 vols. 4to, 1748-52). A new edition of the *Tracts* was issued by Sir Walter Scott (London, 13 vols. 4to, 1809-15). His *Life* was written by R. Cooksey (1791). Revised by F. M. COLBY.

Somerset: city: capital of Pulaski co., Ky.; on the Cin., N. O. and Tex. Pac. Railway; 6 miles N. of the Cumberland river and 79 S. of Lexington (for location, see map of Kentucky, ref. 4-H). It is in a grain, fruit, and vegetable growing region, near extensive mines of coal and iron, and contains 12 churches, 2 high schools, a national bank with capital of \$100,000, a banking company with capital of \$80,000, and 2 weekly newspapers. Pop. (1880) 805; (1890) 2,625; (1895) estimated, 3,500. EDITOR OF "REPORTER."

Somerset: village; Perry co., O.; on the Balt. and Ohio Railroad; 20 miles S. W. of Zanesville, and 24 S. by E. of Newark (for location, see map of Ohio, ref. 6-G). It is in a region abounding in coal, iron ore, and potter's clay, and contains flour-mills, planing-mills, woolen-mills, carriage-factories, a State bank with capital of \$15,000, and a weekly newspaper. Pop. (1880) 1,207; (1890) 1,127.

Somerset: borough; capital of Somerset co., Pa.; on the Baltimore and Ohio Railroad; 36 miles N. W. of Cumberland, Md.; 110 miles E. S. E. of Pittsburg (for location, see map of Pennsylvania, ref. 6-C). It is principally engaged in the lumber-trade and in the manufacture of maple-sugar, butter, and cheese, and contains a public high school, 2 national banks with combined capital of \$100,000, and 4 weekly newspapers. Pop. (1880) 1,197; (1890) 1,713.

Somerset, EDWARD SEYMOUR, Duke of: b. about 1500; brother of Jane Seymour, third queen of Henry VIII. and

mother of Edward VI. After the death of Henry he rose to the head of affairs; was created Duke of Somerset and earl-marshal of England in Feb., 1547, and in March was made lord protector and governor of the realm, becoming king in all but name. When the Scots opposed the marriage of Mary Stuart to Edward VI., Somerset invaded their country and defeated them in the battle of Pinkie. This drove them to form an alliance with France, and war followed between that country and England, resulting in the latter's loss of Boulogne. His arrogance and rashness provoked opposition, and among his political adversaries was his own brother, Sir Thomas Seymour, who was apprehended and executed by his orders Mar., 1549. This brought the protector into great odium, and in Oct., 1549, he was deprived by the young king of his protectorship and thrown into the Tower, but was released with a full pardon in a few months. Among his foremost rivals was the Earl of Warwick, afterward Duke of Northumberland. Somerset entered into a plot against his life; was again arrested, found guilty of felony and constructive treason, and was beheaded on Tower Hill, Jan. 22, 1552.

Somerset, FITZROY JAMES HENRY: See RAGLAN.

Somerset, ROBERT CARR, Earl of: See OVERBURY, SIR THOMAS.

Somersetshire: county of Southwestern England; bounded on the N. and W. by the Bristol Channel; area, 1,630 sq. miles. The surface is much diversified by ranges of low, rocky hills; the Mendip Hills in the N. and the Quantock Hills in the W. Coal and freestone are mined, and iron and lead in small quantities. Large tracts of meadow and marshes afford excellent pasturage. The cheese known as Cheddar and cider are largely produced. Good wheat is raised around Bridgewater. Dairy-farming is one of the principal occupations; leather, glass, paper, and iron goods are manufactured. Pop. (1891) 484,337.

Somers's Islands: See BERMUDA ISLANDS.

Somerville, WILLIAM: poet; b. at Edston, Yorkshire, England, in 1677; entered Westminster School in 1690; became a fellow of Oriel College, Oxford, and in 1704 succeeded to his patrimonial estate, where he lived like a jovial country squire, dividing his time between his hounds, his books, and his bottle. His poems are *The Two Springs*, a *Fable* (1726); *Occasional Poems*, *Translations*, etc. (1727); *The Chase*, his best production, a didactic blank verse poem in four books on the art of hunting (1735); *Hobbinol*, or *the Rural Games*, a burlesque in blank verse (1740); and *Field Sports* (1742). D. July 19, 1742. Revised by H. A. BEERS.

Somerville: city; Middlesex co., Mass.; on the Mystic river, and the Boston and Maine and the Fitchburg railways; joining Boston on the N. W. (for location, see map of Massachusetts, ref. 2-H). It was formerly a part of the town of Charlestown, from which it was set off in 1842, and is a residential city whose inhabitants are largely engaged in business in Boston. It is connected with Boston by seven lines of electric and five of steam railway, contains 31 churches, 24 public-school buildings, valued at \$790,000, a public library, hospital, old women's home, insane asylum, 3 public parks, a national bank with capital of \$100,000, a savings-bank, and 2 weekly newspapers. The U. S. census returns of 1890 showed 387 manufacturing establishments (representing 58 industries), with a combined capital of \$3,788,018, employing 3,126 persons, paying \$1,716,496 for wages and \$4,369,064 for materials, and turning out products valued at \$7,824,082. The city was settled in 1629 and incorporated as a city in 1872. It is built on seven hills. The first vessel built in the State was launched from Gov. Winthrop's Ten Hill farm on the Mystic river in 1631; a powder-house erected on Quarry Hill about 1708 is carefully preserved and is now in the center of a public park; the strongest fortifications in the vicinity were built on Winter Hill during the siege of Boston; Gen. Putnam's "impregnable fortress" was on Cobble Hill; and the "citadel," where Washington raised the first colonial union flag, Jan. 1, 1776, was on Prospect Hill. Pop. (1880) 24,933; (1890) 40,152; (1895) estimated, 52,000. JOHN S. HAYES.

Somerville: borough; capital of Somerset co., N. J.; on the Raritan river, and the Central Railroad of N. J.; 11 miles W. N. W. of New Brunswick, and 36 miles W. S. W. of New York (for location, see map of New Jersey, ref. 3-C). It has gas and electric-light plants, sewers, water-works, 7 churches, graded public school with 16 teachers, a Baptist classical school, 3 primary schools, public library

(founded in 1871); 2 national banks with combined capital of \$142,000, a savings-bank, and a monthly and a weekly post-office. The borough was founded about 1665, and was known as *Sancton* till 1899. During the Revolutionary war the American army was encamped in the immediate neighborhood of Somerville for a long time. Pop. (1900) 3,105; (1880) 2,801; (1855) estimated, 4,291, with suburbs 4,700.

D. N. Minsin, "Somerset Democrat."

Somerville, Mary: scientific writer; b. at Jefferson, Maryland, Dec. 26, 1780; daughter of Admiral Sir William Pakenham. In 1800 she married Samuel Dugg; in 1803 was left a widow with two sons and an independent fortune; went through a course of pure and applied mathematics. In 1819 she married her cousin William Somerville, who aided her in her studies. In 1840 her *Mechanism of the Heavens* was published. The preparation of this work, an attempt to bring the *Mécanique céleste* of Laplace within the reach of a larger range of students, was undertaken at the solicitation of Lord Brougham. In 1834 she published *Connection of the Physical Sciences*; in 1840, *Physical Geography*; in 1845, *Mineralogical and Molecular Science*. She was elected a fellow of the Royal Astronomical Society in 1832, and afterward a member of several other British and foreign scientific societies. D. in Naples, Nov. 29, 1872. An autobiography edited by her daughter appeared in 1873.

Somme, sôme: a river of France. It rises in the department of Aube, passes by St.-Quentin, Ham, Amiens, and Abbeville, and falls into the English Channel after a course of 152 miles. It is navigable to Amiens, and is connected with the Seine, Oise, and Scheldt by canals.

Somme: department of Northern France; bordering on the English Channel, on both sides of the river Somme; area, 2,579 sq. miles. The surface is flat, but the soil very fertile and large crops of corn, hemp, hops, and fruit are raised. Cattle-breeding is extensively carried on, and the manufacture of velvet, silk, cotton goods, soap, chemicals, beetroot-sugar, paper, and linen are very important. It is traversed by the Northern Railway and the railway from Amiens to Boulogne. Pop. (1891) 540,495.

Somnambulism (Lat. *somnus*, sleep + *ambulare*, walk): a peculiar perversion of the mental functions during sleep, in which the subject becomes an automaton. The organs of sense remain dormant and the intellectual powers are blinded. During this condition some instinctive excitation may take place, and there may be the production of impulses, in consequence of different kinds. One individual may walk along the ledge of the roof of a house, and another may jump into a river, or a third may commit homicide. The condition is very much less common than is supposed, although imperfect examples are seen in persons who walk at night in sleep. A slight stimulation of the organs of sense is sufficient to restore the person. Cases have been described where hysteria takes this form. Somnambulism may sometimes be induced by hypnotism, the patient walking about unconscious; but many such cases are fraudulent. See HYPNOTISM.

WILLIAM PEPPEL.

Somnath: ancient and decayed town of the peninsula of Ansonia, India; to lat. 30° 30' N., lon. 70° 24' E.; contains a famous temple, now in ruins, but at one time one of the richest and most venerated places of Hindu worship (see map of S. India, ref. 3-11). Mahmud of Ghazni sacked the temple in 1024, and carried away its magnificent gates, celebrated as much for their exquisite workmanship as for the costliness of their materials. In 1842 some gates, said to be those of the temple in Somnath, were brought from Afghanistan by the British, but, to avoid exciting jealousy between the two great religious bodies of the Hindus, they were placed in the arsenal of Agra. Pop. about 6,000.

Sona'ta (= Ital. *sonata*, thing), *liter.*, something sounded or played on an instrument. *fem.* perf. partic. of *sonare*, sound; originally, in the latter part of the sixteenth century, any kind of composition for instruments, in contradistinction to vocal compositions, which were called *cantata*. Subsequently, especially after the time of Bach, the name was applied principally to compositions for solo instruments and of a certain form, consisting of several movements—first, three, the *allargo*, *adagio*, and *rondo*—to which afterward a fourth was added by Haydn, the *minueto* or *scherzo*, which differed from each other in time and sentiment, but were held together by the general character pervading all. This form of composition was greatly developed by Haydn and Mozart, and culminated in Beethoven.

Song-books (*lyr. chansonniers*; Ital. *canzoniere*; Span. *canzoneros*; Port. *canzonetários*; the manuscripts in which has come down to us the greater part of the lyric poetry of the Middle Ages in all the chief countries of Europe. As medieval poems were for immediate delivery, either by themselves or by professional singers (*jongleurs*, etc.), their productions were usually scattered or even entirely lost. At first, perhaps, the song-books were merely single sheets containing isolated songs, put together for the sake of convenience; but later it grew to be the fashion for rich patrons of poetry to have collections of lyrics made for their own use. Those were of the nature of anthologies, and successive generations of writers constantly varied the contents of the older books in preparing the new. As poets and poems grew obsolete, their names and places were usurped by new ones. Hence only a small part of the work of any single medieval lyric poet is extant. The collections that have come down to us, however, are very precious. They often contain the music to which the poems were sung, and are adorned with elaborate miniatures and other decorations.

The number of medieval songbooks in various languages in the libraries of Europe is very great. Those containing Provençal lyrics are enumerated by K. Bartsch, *Gesamtes Verzeichniss der provenzalischen Literatur* (Klarsfeld, 1872). The French *chansonniers* have been studied by G. Raynaud, *Bibliographie des chansonniers français du XIII^e et XIV^e siècles* (2 vols., 1884), and by J. Baskelmann, *Die altfranz. Chansonniers in den Bibliotheken Frankreichs, Italiens und der Schweiz* (in Herrig's *Archiv*, vol. xli.). The most famous collection of early Italian lyrics is the *Cod. Vat. 3,703*, published by A. d'Ancona and D. Comparetti (5 vols., Bologna, 1875-88), though this has to be supplemented by several others in various libraries in Italy. For the early lyric poets of the Spanish Peninsula, who wrote in the Portuguese-Galician tongue, there are the magnificent *Cod. Vat. 4,805* (known as the *Chansonniers du Vaticane*) and several others. The Spanish lyrics of the fourteenth and fifteenth centuries are collected in a whole series of *Chansonniers*, of which the first is the so-called *Chansonniers de Rimado*, made about 1450; and the most extensive is the *Chansonniers General* of Fernando del Castillo, first printed at Valencia in 1611. Of all medieval song-books, perhaps the most famous is the great German collection variously known as the *Maessian* (though with no good reason), the *Paris*, and the younger *Heidelberg* manuscript. This splendid volume became known to scholars in the sixteenth century, when it was in the possession of a certain Freiherr Hans Philipp von Hohenhausen, of Fürsteburg, in the Rheinhell. Later it was at Heidelberg, but after the sack of this place in 1622 it made its way mysteriously into the royal library in Paris. Here it remained till 1889, when the Heidelberg Library obtained it at a valuation, it is said, of \$100,000—probably the highest price ever given for a manuscript or book. In England there were many song-books, but not of distinguished character.

A. R. MASON.

Songkoi, or Songtao (song is Annamite for river): the largest river of Eastern Indo-China and a trade-route of large potential importance. It rises in the mountains of Northern Yunnan, China, flows S. E. and empties into the Gulf of Tonquin after a course of about 750 miles, half of which is in Yunnan and half in Tonquin. The most important affluent is the Songkai, which rises near the source of the Songkoi, parallels its course, and enters the latter on the left bank, not far above Hanoi. Just below its mouth begins an enormous delta, which is increased in size by lateral communications of the Songkoi with the Songkai, the next river to the N. The lower river is subject to floods in the spring and early summer, when the water sometimes rises 15 or 20 feet in twenty-four hours, and much of the lower stream is diked. The waters during the inundations are reddened by the soil, whence the French name of the river (*flamme*). In 1880 a steamer drawing 28 inches ascended the river to Lankai at the Chinese boundary in sixty hours from Hanoi. The stream has always been an important native trade-route.

MARK W. HARTSTROX.

Song of Birds: the musical notes uttered by many birds, especially by certain passerines, although others, as of the snipe family even, like the woodcock and Dartma's sandpiper, have a pleasing combination of notes. Nearly all birds, in fact, utter some kind of a cry, but in the majority it can scarcely be called a song. In man and other mammals sounds are produced in the larynx, but in birds musical sounds are produced in an enlargement of the windpipe,

termed the syrinx, just above the forks of the bronchi. To the syrinx are attached the singing muscles, numbering in the oscines from four to six or even eight pairs. The apparatus is simple, and its modifications are comparatively slight. There is no reason to suppose that the tongue takes any, at least any important, part in the production of sounds even in birds which pronounce words. Song is almost exclusively an attribute of male birds, although the female may sing, as does the cardinal of the U. S., and it is heard most often during the time of pairing, so that springtime is pre-eminently the season of song; still some birds sing pretty much throughout the year, and even, like the Carolina wren, in winter. The bobolink, on the other hand, changes his manners with his coat, and sings only in full-dress plumage. Early morning is the favorite hour for song, next to that the sunset-hour, but some birds, like the scarlet tanager, sing during the torrid heat of a southern noonday, and many songsters besides the nightingale sing at night, notably the mocking-bird and yellow-breasted chat of the U. S. The gay-plumaged birds of the tropics belong largely to the harsh-voiced *Clamatores*, but a bright coat is not a sure sign of a discordant voice, for the majority of that strictly American family the tanagers inhabit the tropics, and sing as well as the familiar scarlet tanager of more northern climes. Not only do individuals of a given species vary considerably in their power of song, but certain localities seem to develop musical talent better than others. The meadow-lark sings better in Florida than in the northern parts of the U. S., while the western subspecies excels that of the east.

F. A. LUCAS.

Song of Solomon: See CANTICLE.

Songs [O. Eng. *song*, *sang*; Germ. *sang*; Goth. *saggus*; cf. Gr. *ōphē*, tuneful voice, oracle < Indo-Eur. *songh-*]: from the literary standpoint, short lyric or dramatic poems suitable for setting to vocal music; from the musical standpoint, compositions of relative simplicity of form which carefully illustrate and enhance the sentiment expressed by the words. In the modern sense this form may be flexible as to development. The word *song* represents an indefinite quantity, in that its characteristics may range through a large scope as to musical value. There are short songs which may be compared to gems, in miniature, by the great painters. There are also the folk-songs of various countries (the *canti popolari* of the Italians), full of national characteristics, and immortal in their simplicity. Lastly, there are myriads of songs whose existence, both as to music and text, is fortunately but for a day.

DUDLEY BUCK.

Songtao: See SONGKOR.

Sonnet [either directly or via Fr. *sonnet* from Ital. *sonetto*, which in its turn probably came from the Prov. and O. Fr. *sonet*, a diminutive derived from the Lat. *sonus*, a sound or air in music]: a poetical form which, as finally perfected by the Italian poets of the thirteenth and fourteenth centuries, consists of fourteen hendecasyllabic verses (corresponding to English decasyllables), arranged according to a rigid scheme. The main features of this are the division of the whole poem into two parts, the first of eight verses (called the octave), the second of six (called the sestet); the further division of the octave into two tetrastiches (called in Italian *pièdi*); the employment of but two rhymes in the octave, arranged *abba abba*; the use of either two or three rhymes in the sestet, arranged as may suit the poet. The sestet, when it forms an indivisible whole, is often called in Italian *simula*; when it falls into two tercets, *volte*. This severe form, however, has not been followed by all sonnet-writers, even from the earliest period. Shakspeare, for example, hardly observes the minor divisions of the sonnet at all. He arranges the rhymes of the octave *abababab*, or even *ababceded*, thus neglecting all the subtle modulations of the Petrarchan type. He often allows the sense to run over from the octave to the sestet; and even when he parts the two he makes little effort to contrast the meaning and the harmony of the latter with those of the former. This loose type of the sonnet is often called the bastard or illegitimate sonnet; but this is hardly justified by the history of the form.

There has been much discussion of the origin and development of the sonnet. The word occurs in both the Provençal and the Old French languages earlier than in Italian. Investigation has shown, however, that here *sonet* means simply a short *son*—i. e. musical air or lyric set to music. There are a few real sonnets in Provençal, but all of them are by Italians, or considerably later than the rise of the Italian sonnet. Everything points, therefore, to Italy as the

birthplace of the form; but there are difficulties as to the manner of its birth. A very widely accepted theory has been that it was originally simply one stanza of the lyric canzone. It is hard to see, however, the motive that should have led to such use of a single part of what was a very elaborately constructed and balanced poetical form. More probable is the theory first set forth by A. d'Ancona, in his *Poesia popolare italiana* (Leghorn, 1878), that the basis of the sonnet is purely popular. In fact, there exist even today popular lyrics, called *strambotti* and *rispetti*, whose existence is fairly assured for the earliest period of Italian poetry. The *strambotto*, whose home seems to have been Sicily, is an eight-lined stanza with rhymes arranged *abababab*. The *rispetto*, on the other hand, which was Tuscan in origin, is a precisely similar stanza, but of six lines, with rhymes *cdcdcd*. D'Ancona believed that the sonnet was obtained by one of the early courtly poets of the so-called Sicilian school, through joining these two forms. This theory has been slightly modified by Cesareo (*La Poesia Siciliana sotto gli Sversi*, Catania, 1894), who thinks that a six-lined *strambotto* existed in Sicily, as well as that of eight lines, and that the combination was effected in Sicily alone. Indeed, Cesareo believes that the inventor of the new form was Giacomo da Lentino, the most original of the Sicilian poets, who flourished in the first half of the thirteenth century. These investigations also show that the earliest sonnet scheme was nearer Shakspeare's than Petrarch's, as the rhymes ran *abababcedcd*.

Though thus in all probability of popular origin, the sonnet form was from the start employed only by courtly poets. The subject-matter of the earliest sonnets is, like that of the rest of the poems of the first Italian cultivated poets, mainly derived from the poetry of Provence. During the thirteenth century it became more and more popular throughout Italy. Many experiments at refining and elaborating it were made. Gradually the rhyme system, *abba abba*, drove out the older system in the octave. Under the influence of Provençal poetical theories, the inner divisions were made sharper and clearer. On another side efforts were made to vary the fixed scheme, either by appending a couplet or group of couplets (*cauda* or *coda*) at the end or by inserting at fixed points subsidiary seven-syllabled lines, which rhymed with the preceding eleven-syllabled lines. According to the number of these insertions, such sonnets were called *sonetti doppi* and *sonetti rinterzati*. In some cases sonnets of twenty-eight verses were thus produced. The simpler form, however, proved the permanently satisfactory one; and this was finally fixed by the great master of all the Italian sonnet-writers—Petrarch.

The diffusion of the sonnet form outside of Italy began when the rest of Europe came to feel the powerful influence of the Italian Renaissance. In the Spanish Peninsula this took place in the fifteenth and early sixteenth centuries; and the earliest Catalan and Spanish sonnets belong to this period. In France, according to Joachim du Bellay, the sonnet was introduced from Italy by Mellin de Saint-Gelais, a poet of the early sixteenth century; but du Bellay himself and his friends of the Pléiade were the first to give it real vogue. In England it was introduced toward the middle of the sixteenth century by Wyatt and Surrey. The earliest German sonnet is to be found in a translation of an antipapal tract by Bernardino Ochino. This translation, made by one Christoph Wirsung, appeared in 1556.

The best general account of the history of the sonnet is to be found in H. Welti, *Geschichte des Sonnettes in der deutschen Dichtung* (Leipzig, 1884). The development of the sonnet in Italy is excellently treated by L. Biadene, *Morfologia del Sonetto nei secoli XIII. e XIV.* (fascicolo 10 of *Studi di Filologia Romanza*, Rome, 1888). Of value, but to be used with care, is Louis de Veyrières's *Monographie du sonnet, sonnettes anciens et modernes* (2 vols., Paris, 1869-70). Less good is C. Tomlinson's work, entitled *The Sonnet: its Origin, Structure, and Place in Poetry* (London, 1874).

A. R. MARSH.

Sono'ra: the northwesternmost state of Mexico; bounded by the U. S. (Arizona) on the N., Chihuahua on the E., Sinaloa on the S. E., the Gulf of California on the S. W., and the territory of Lower California on the N. W. Area, 77,344 sq. miles. The Sierra Madre Range forms the eastern boundary, and its spurs and sub-ranges cover much of the eastern part of the state, which is very imperfectly known. Succeeding this region are plateaus and valleys with a rich soil, but only available for agriculture by irrigation. The

lands along the coast are arid, except in the river valleys. The northwestern part is a desert, resembling the adjacent parts of Arizona. Of the few rivers the Yaqui is the most important. The climate is hot on the lowlands, mild on the plateaus and in the higher valleys; rains (principally from July to September) are scanty, and the northwestern deserts and parts of the coast-belt are essentially rainless. There is no true forest, except in the mountains. The state is rich in minerals; the mines of silver and gold have long been famous, lead occurs in conjunction with silver, and lately important coal-beds have been opened in the Yaqui valley, the product being exported to Arizona. Mining is the only important industry; cereals, etc., are cultivated in the river valleys, and there are considerable herds of cattle in the north. A kind of guano is found on islands in the Gulf of California. The Sonora Railway (from the port of Guaymas, on the gulf, to Benson, on the Southern Pacific Railroad) was originally built as an outlet for the coal-fields. Pop. (1893) estimated, 140,500. A large proportion are Indians of the Opatá, Pima, and other tribes, who retain their old customs and languages, and in many cases are practically independent.

H. H. SMITH.

Sonora: city; capital of Tuolumne co., Cal.; on Wood's creek; 60 miles E. of Stockton, 90 miles S. E. of Sacramento; equidistant from the Yosemite valley and the Calaveras big-tree region (for location, see map of California, ref. 7-E). It is the center of a large gold-mining area; is principally engaged in mining, agriculture, lumbering, and grape-growing; and contains water-works, the Snell Library, an academy, foundry, quartz-mills, and three weekly newspapers. Pop. (1880) 1,492; (1890) 1,441.

Sonson: town of the department of Antioquia, Colombia; on the river Sonson; 33 miles S. S. E. of Medellín; 8,350 feet above the sea (see map of South America, ref. 2-B). It is the center of a rich grazing district, and is noted for its mild and salubrious climate and beautiful scenery. The river here forms a triple fall of 200 feet, and causes in its deep ravine a continual *son-son*, or echo, whence the name. Pop. about 12,000.

H. H. S.

Sonsonate: town of Salvador; beautifully situated on a plain by the Sonsonate river, and on the railway from Santa Ana to the port of Acajutla; 40 miles W. of San Salvador (see map of Central America, ref. 4-E). It was founded soon after the conquest, and is the center of a rich agricultural district and the capital of a department of the same name. Pop. about 9,000.

H. H. S.

Sontag, zōntaa'h, HENRIETTE: opera-singer; b. at Coblenz, Germany, Jan. 3, 1806; was gifted with fine vocal and dramatic powers, which were highly cultivated; excelled in German and Italian music, and at the age of twenty-five rivaled Malibran, Pasta, and Catalani; married Count Rossi, an Italian noble, in 1830, and retired to private life. She resumed her professional career in 1849, made a tour in the U. S. in 1853, and in Mexico. D. of cholera in Vera Cruz, June 18, 1854.

Revised by B. B. VALLENTINE.

Soo-Chow-Foo: See **ST-CHOW**.

Soodan: another spelling of **SUDAN** (q. v.).

Soofoes: See **SUFIS**.

Soo'soo, or Susu: the *Platanista gangetica*, a cetacean of the Ganges, the only living representative of the family *Platanistidae*, which is allied to the *Iniidae*, or fresh-water dolphins of South America. It is some 6 or 8 feet long, and is ordinarily very sluggish, but can move after its prey, which consists of fish and crustaceans, with much vigor. It has long beaked jaws, 120 teeth, and curious rudimentary eyes.

Revised by F. A. LUCAS.

Soot [O. Eng. *sōt*: Icel. *sōt*; cf. Ir. *suth*: Lith. *sūdis*; Fr. *sotie*]: a carbonaceous deposit from smoke, formed in chimneys. That which forms nearest the fire is often shining and varnish-like, consisting chiefly of dried tarry matters mixed with carbon, and giving a brownish-black powder, sometimes used as a pigment under the name of *noître*. That which forms further up the chimney is more of the character of **LAMPBLACK** (q. v.).

Sooty Tern: See **EGG-BIRD**.

Sooty-smith, sois'mith, WILLIAM: civil engineer; b. at Tarenton, O., July 22, 1830; graduated at the Ohio University in 1849, and at the U. S. Military Academy July 1, 1853. In 1854 he resigned from the army to engage in civil engineering; in 1855 became principal of the Buffalo High School. Resuming his profession in 1856 he was in 1859 placed in

charge of the construction of a bridge over the Savannah river, the foundations of which consisted of pneumatic piles. In the civil war he served as colonel of the Thirtieth Ohio Volunteers in West Virginia till Jan., 1862, when transferred to the Army of the Ohio, and was engaged at the battle of Shiloh, Apr. 7. Commissioned brigadier-general of volunteers Apr. 15, he participated in the siege of Corinth; commanded a division at the battle of Perryville; was chief of the cavalry department of the Tennessee July-Oct., 1863, and of the division of the Mississippi Oct., 1863-July, 1864, when compelled by ill health to resign. He has since been engaged in sinking foundations for bridges and other structures. He was a member of the U. S. board of 1875-76 for testing iron and steel.

Revised by M. MERRIMAN.

Sophi'a (anc. *Serdica*; Bulg. *Sreletz*): city; capital of Bulgaria; on a small tributary of the Iskra, and on the main railway between Vienna and Constantinople (see map of Turkey, ref. 3-C). Till 1878 it was "a dirty and pestilential village of wooden huts," but since Russia wrested from the Ottomans a semi-independence for Bulgaria (1878), it has marvelously improved. It now resembles a European city with its straight, clean streets and attractive houses. Over 7,000 Ottomans from among its former residents have emigrated, but the population has almost trebled in seventeen years. Sophia possesses a commodious palace, the residence of the prince, a cathedral, an excellent college and schools, and a public garden. It manufactures leather, earthenware, and woolen cloth, and carries on an active transit trade. Pop. (1893) 47,000.

E. A. GROSVENOR.

Sophists [from Lat. *sophistes* = Gr. *σοφιστής*, deriv. of *σοφίζεσθαι*, be or become wise, play the wise man or Sophist]: name applied to the seven wise men of Greece; afterward to the teachers at Athens who gave lessons in the arts and sciences for money. The course of Greek philosophy begins with the establishment of a material first principle—water, air, fire, etc.—and tends toward the recognition of mind as this first principle. Anaxagoras explicitly announced mind (*νοῦς*) as such first principle. The first and most obvious phase of mind as an activity is its capacity to reflect, and hence to discover grounds and reasons. Each ground or reason in some measure communicates its peculiar character to the fact or opinion which it grounds. Hence from the standpoint of grounds and arguments all truth seems to be an arbitrary affair, depending upon the selection which one makes of grounds and reasons. Truth is supposed to be many-sided, and the point of view taken is supposed to justify one's difference in opinion. The art of presenting grounds or reasons to justify any view is the art of the Sophists. The fact that these many sides or grounds of truth are mutually interdependent, and therefore that each has truth only as seen in view of the rest—this is the further and deeper insight which it belonged to Socrates and Plato to discover and unfold. The universal or general is the net result, as well as the active principle, of that dialectic process which appears in the genesis and mutual destruction of different opinions—"different points of view." As a necessary elementary stage of human thinking, the work of the Sophists is of permanent importance in the history of philosophy. The Eleatics, who set up the doctrine of pure being, found it necessary to deny being to the phases of change, finitude, and negativity that appear in the world. Zeno accordingly discovered the dialectic of self-contradiction involved in those phases. This was adopted by the Sophists, of whom the chief were Protagoras the Individualist (b. 490 B. C.), Gorgias the Nihilist (came to Athens 427 B. C.), Hippias the Polymathist, and Prodicus the Moralist (the two latter being younger contemporaries of Protagoras). Everything that existed in the Greek consciousness as opinion, faith, custom, religious tradition, even the evidence of the senses, was sapped and rendered uncertain by the ratiocination of these Sophists. Protagoras asserted: Man is the measure of all things. Just as each thing appears to each man, so is it for him. All truth is relative. The existence of the gods is uncertain. Gorgias expressed his nihilism in three propositions: (a) Nothing exists; (b) if anything existed, it would be unknowable; (c) if anything existed, and were knowable, the knowledge of it could nevertheless not be communicated to others. "Common sense," so called, is the stage of naïve faith in one's point of view. The discovery of the equal validity of "many points of view" leads on the one hand to sophistical practices, or on the other to skepticism. Pyrrhonic skepticism in Greece connects back through the Megarian school to the dialectic

of the Sophists and of Zeno the Eleatic. See articles SOC-RATES, PHILOSOPHY (*History of Philosophy*), and MORAL PHILOSOPHY.

WILLIAM T. HARRIS.

Sophocles, sof-ō-klēz (Gr. Σοφοκλῆς): the second in time of the three great tragic poets of Greece; b. of a wealthy family at Colonus, a beautiful deme of Attica near Athens, in 496 B.C. He was carefully trained in all the arts of a liberal education, in gymnastics and music. At the age of sixteen he led the chorus of boys who danced and sang the pæan in honor of the victory of Salamis, and there is other evidence of his personal beauty and grace. His first play, acted in 468, was a great success, and won the prize over Æschylus after a close contest which was finally referred for decision to Cimon and his fellow generals. For the next ten years Sophocles divided with Æschylus the empire of the stage, the older rival learning from the younger as the younger had already learned much from the older. After the death of Æschylus, Sophocles was the leading dramatist. He never failed of at least the second prize, and coped successfully with such plays as the *Alceste* and the *Medea* of Euripides. But as Æschylus accepted the improvements of Sophocles, so Sophocles in his later plays was clearly influenced by Euripides, whose greatness he did not fail to recognize. Sophocles took an active part in public life, and was called to hold high positions. In consequence of the sentiments expressed in his *Antigone* (440) he was made a colleague of Pericles in the command of the forces sent against Samos. Before that he had been an Hellenotamias or treasurer of the Alliance, and in the troublous times of the Peloponnesian war he is said to have been one of the *probuli* (πρόβουλοι) or committee of safety appointed in 411. Love played a large part in his life, and his sweet and easy temper was often put to the test. According to a familiar tradition, when far advanced in years Sophocles was brought before a family court by his son Iophon on the charge of disordered intellect. The aged poet recited the famous encomium on Colonus from the *Œdipus Coloneus*, which he had just composed, and the charge was dismissed—as the story may be. He died an easy death in 405.

Of his 123 dramas seven are extant, *Ajax*, *Electra*, *Œdipus Tyrannus*, *Antigone*, *Trachiniae*, *Philoctetes*, *Œdipus Coloneus*, the first three being the most popular in Byzantine times. Sophocles introduced the third actor and thus increased the life and movement of the drama, and life and movement were also enhanced by the change which made each drama of the trilogy (see ÆSCHYLUS) an independent play. These and other changes in the external form are manifestations of the same spirit that we find working in the heart of the Sophoclean drama. When we study Sophocles we are no longer in the Æschylean realm of Titanic beings, too vast for human sympathy, for while the heroes and heroines whom Sophocles brings before us are lifted above our level, they are of like passions with ourselves, and the motives are motives of flesh and blood, of human character and human will. His *dramatis personæ* are eternal types "writ large." In the construction of the plot Sophocles had no rival. His *Œdipus Tyrannus*, to cite but one instance, is a tragic web of unequalled subtlety and effectiveness. The lyric parts of his plays are in beautiful balance with the dramatic element. His language is more supple than that of Æschylus, but never falls short of elevation. It is sweet and yet does not lack a certain tang of austerity that saves it from cloying.

EDITIONS.—Among the most memorable editions of all the plays are those of G. Hermann (1830–41), Wunder-Wecklein (4th ed. begun in 1875), Schneidewin–Nauck (begun by Schneidewin in 1849 and repeatedly issued since), Campbell, in 2 vols. (1873, 1881, and repeated), Campbell–Abbott, 2 vols. (1886); above all, the monumental edition of Jebb (begun in 1883, nearly complete in 1895, with repeated issues of *Œdipus Tyrannus* and *Antigone*). Select plays by Wolf–Bellermann (begun 1858, often repeated). Text ed. by Dindorf (Teubner collection), by Schubert (Schenkli collection), by Nauck (Weidmann). Of noteworthy editions of single plays may be mentioned *Ajax*, by Lobeck (3d ed. 1866); *Antigone*, by Boeckh (1843), by Humphreys (1891); *Electra*, by Jahn (3d ed. 1882); *Œdipus Tyrannus*, by Elmsley (1821); *Œdipus Coloneus*, by Reisig (1820); *Philoctetes*, by Blaydes (1870), who has edited other plays of Sophocles also. Of translations into English verse may be noted Plumptre (1866) and Campbell (1874); of translations into English prose after Jebb's text, E. P. Coleridge (1893), and Jebb himself in the edition cited. For the enormous bibliography (down to 1874 only), see Genthe's *Index Commentationum Sophocle-*

arum. Invaluable is Ellendt's *Lexicon Sophocleum* (2d ed. by Genthe, 1872). See also Schöll's *Sophokles* (2d ed. 1870), and Patin's *Sophocle* (5th ed. 1877). B. L. GILDERSLEEVE.

Sophocles, EVANGELINUS APOSTOLIDES: Greek scholar; b. at Tsangaranda, Thessaly, Greece, Mar. 8, 1807; studied at the convent on Mt. Sinai; emigrated to the U. S.; entered Amherst College in 1829; was tutor in Harvard College, with a brief intermission, from 1842–49; assistant professor 1849–60, and in 1860 became Professor of Ancient, Modern, and Byzantine Greek. He published a *Greek Grammar* (1838; 3d ed. 1847); *First Lessons in Greek* (1839); *Greek Exercises* (1841); *Greek Lessons for Beginners* (1843); *Catalogue of Greek Verbs* (1844); *History of the Greek Alphabet*, etc. (1848); *Glossary of Later and Byzantine Greek* (1860), revised as *Greek Lexicon of the Roman and Byzantine Periods* (1870), etc. D. at Cambridge, Mass., Dec. 17, 1883.

Sophonis'ba: See MASINISSA.

Sophon: inventor or rather perfecter of the so-called MIME (q. v.); flourished at Syracuse in the middle of the fifth century B.C. The office of the mime was to represent in dramatic form a special situation or a special personage. It was a *commedietta* that lacked a chorus, that lacked an elaborate plot. The mimes of Sophron enjoyed a great reputation in ancient times; Plato read them again and again and slept with them under his pillow, and in Rome they were learned by heart and much imitated. A few fragments have been collected by Blomfield in *Museum Criticum* (vol. ii., 1826), and by Ahrens, *De Græc. Dialect.* (vol. ii., p. 464).

Revised by B. L. GILDERSLEEVE.

Soprano: the highest type of the voice of women and boys. The compass of the high soprano may be said to extend from lower E on the treble staff to C above, and that of the mezzo-soprano from A below to A above. Among the high sopranos exceptional compass is sometimes found, reaching even to F and G in alt.

D. B.

So'ra: town; in the province of Caserta, Italy; on the Garigliano; about 58 miles N. N. W. of Naples (see map of Italy, ref. 6–E). The manufactures of paper, woolen, and other stuffs here are on a considerable scale, and are provided with modern machinery. Pop. about 5,400.

Sorac'te: the present *Monte di San Oreste*, a mountain of Etruria, an outlying offset of the Apennines, from which it is detached by the valley of the Tiber. It rises with its bold and abrupt masses of the peculiar hard Apennine limestone 2,420 feet above the surrounding plain, and forms, especially when its top is covered with snow, a conspicuous and very picturesque feature in the views of the Campagna. (Horace, *Carm.*, i., 9.) In ancient times it was dedicated to Apollo, and bore on its top a celebrated temple of this god, to which large and peculiarly solemn processions were made from Rome, situated 26 miles to the S. In 746 Carloman, the brother of Pepin, founded the monastery of San Silvestro on the site of the old pagan temple. Its present name the mountain has received from a village, San Oreste, situated on its slope and well known for its sour wine.

Revised by J. R. S. STERRETT.

Sorata: See ILLAMPU.

Sorbian Language: another name for Lusatian–Servian; see SLAVIC LANGUAGES.

Sorb'ite, or **Mountain-ash Sugar** [*sorbite* is from Lat. *sorbum*, sorb-tree]: a saccharine substance formed in the juice of the berries of *Sorbus aucuparia*, the mountain-ash of Europe, as well as in the related American, *Sorbus americana*. The compound has the composition $C_6H_{12}O_6$, being isomeric with mannite. It belongs to the alcohols, and is in turn related to the sugars.

I. R.

Sorbonne, sör'bün': the name generally applied to the theological faculty of the ancient University of Paris. It was derived from Robert de Sorbon (b. at Sorbon, in the Ardennes, in 1201, and afterward chaplain to Louis IX.; d. in Paris, renowned for sanctity and eloquence, 1274). In 1252 he founded an institution connected with the University of Paris, in which seven secular priests were to teach theology gratuitously to sixteen poor students, and in the following year the institution received its charter from Louis IX., which was confirmed in 1268 by Pope Clement IV. Connected with it was a preparatory school. Both were under a provisor. The severity of the examinations made its degrees of high esteem. The great care which was taken not to admit among the teachers any but men of the highest

talents and attainments soon procured for the school a European fame, and in the fourteenth century the entire theological faculty of the university was merged into it. During the Middle Ages, the period of the Reformation, and even after that time, the Sorbonne was generally considered one of the highest authorities of the Christian Church, and its decisions were appealed in not only in those beyond controversy, but also in the contests between the popes and the secular powers. It demanded the condemnation of John of Arco; it justified the massacre of St. Bartholomew; it vigorously sided with the League and condemned both Henry III. and Henry of Navarre. On the other hand, it introduced printing into Paris immediately after its invention, and prevented the introduction of the Peter's Pence and the Inquisition into France. It was a staunch champion of the freedom of the Gallican Church, and strongly opposed to Ultramontanism. It condemned Jansen and the Jansenists in matters of doctrine, but it sided with them in their fight with the Jesuits. Its culmination was in the time of Cardinal Richelieu, who, himself a graduate of the school, provided it with a magnificent building and enlarged its library (1639). It was then that appeared the famous Latin couplet, which may be thus translated literally: "Renovated the Sorbonne goes to immediate ruin. While it was falling it stood unshaken; restored it will perish." In its contest with the philosophy of the eighteenth century it was unsuccessful, and it had outlived its fame when during the Revolution it was suppressed and bereft of its endowments (1793). At the reconstruction of the university in 1808 by Napoleon I. the building, still called the Sorbonne, became the seat of the academy, and between 1816 and 1827 was given to the theological faculty in connection with the faculties of science and belles-lettres. New buildings for the Sorbonne were erected 1894-99 at an expense of nearly \$4,000,000. See E. J. Duvivier, *Histoire de la Sorbonne* (2 vols., Paris, 1793); A. Franklin, *La Sorbonne* (1897; 2d ed. 1875).

Revised by S. M. JACKSON.

South-tree, or Wild Service: the *Pyrus terminalis*, a small European tree (family Rosaceae), the wood of which is very hard and valuable. Its fruit, the sorb, when over-ripened, is soft and mellow and very good eating. Hertfordshire, England, is famous for its sorts, which are largely marketed in London. The name is sometimes applied to *P. domestica*. See SERVICE-TREE.

Sorcery: See MAGIC.

Sorel (river): See RICHMOND.

Sorel: *shelton* of Richelieu co., Quebec, Canada; at the junction of the Richelieu with the St. Lawrence, and on the south shore of the Gulf, 45 miles below Montreal (see map of Quebec, ref. 5-B). It has an excellent harbor, which is used during the winter months as a place of refuge for the river steamboats. The trade is almost confined to the shipping of grain and farm produce. The manufactures are mostly connected with the repairing of steamboat machinery. The town has for its center a well laid-out square, and occupies the site of a fort built in 1665 by M. de Tracy. Its former name was William Henry. The Duke of Kent, the father of Queen Victoria, resided here for a time. There are 2 newspapers, 2 branch banks, and several hotels. Ship-building was formerly carried on. Pop. (1891) 9,000, of whom not more than 500 are English-speaking. J. M. HARPER.

Sorel, August: See AUGUST SOREL.

Sorel's Cements: certain cements named from the inventor, a French chemist. The principle on which they are founded is the mixing of a concentrated solution of a metallic chloride with the oxide of the same metal to a pasty mass, when, in case of several metals, a solid insoluble oxychloride is rapidly formed, which is sometimes quite crystalline and hard. The most approved compositions of this class are those made with the chlorides of zinc and magnesium. A solution of magnesium chloride of a density of 20 to 25° of Baumé's hydrometer is mixed with magnesia or a paste, which may be applied and moulded like plaster. A solution to a white mass of the hardness of marble. Chloride of zinc solution mixed with oxide of zinc forms a similar cement-composition. Revised by I. A. HENCKS.

Sorel-atoms: See STONE.

Sorghum: a tall, broad-leaved annual plant of the grass family, regarded as a variety (*Suscharitum*) of the polymorphic *Andropogon sorghum*. Its original home was doubtless the interior of Africa, but modern travelers do not report its having been found there in a wild state, and the

wild forms, as in the case of the nearly related sugar-cane, appear to have been lost. Sorghum as a cultivated plant has been known from remote antiquity. It was introduced into Italy at the beginning of the Roman empire, but its culture did not flourish. Experiments were again conducted with it at Florence, Italy, in 1709, by Pietro Ardano, but with no practical results. In China it has been cultivated from the earliest historical times, not only as a cereal and for fuel and forage until recently. In 1840 Abadie sent some seeds to the museum at Paris, and about 1850 Missionary sent some from the north of China to the Geographical Society of Paris. About fifteen varieties were received, some of which contained saccharine juices.

Field of sorghum.

In 1853 W. R. Prince, of Flushing, L. I., obtained a few seeds from France. These produced a few pounds of seed, which were distributed in 1854. In 1857 Leonard W. Wray introduced into the Southern States seed which he obtained from Natal. The African varieties were called Imphee, while those originally derived from China were known as Chinese sugar-cane. In a few years sorghum was very generally known in different parts of the U. S., and some of the early varieties, such as the Amber, were found to mature as far N. as Minnesota.

During the civil war the culture of sorghum was carried on to a considerable extent, and by reason of the high price of sugar the products, mostly molasses, were brought into quite general consumption. Crystallizable sugar had been obtained as early as 1855, and was often made in the laboratory and in small amounts; but no systematic attempts were made to use the plant for making sugar until the subject was taken up in the department of agriculture in 1878 by Dr. Peter Collier. As a result of his investigations he predicted that sorghum could successfully compete with sugar-cane and sugar-beets as an economical source of the sugar-supply of the U. S., and attempts were made in many localities to manufacture sugar. In 1882 the commissioner of agriculture offered ten prizes of \$1,200 each for the most successful attempts to make sugar from sorghum. The total amount of sugar reported by the ten successful applicants was 116,155-5 lb., of which 86,000 lb. was made by one firm. The department of agriculture at Washington made 165 lb. of sugar in 1881, and after making nearly 10,000 lb. in 1883 conducted experiments on a somewhat larger scale at Ottawa, Kan., in 1885, and at Fort Scott, Kan., in 1886-87. Large quantities of sugar were produced, but it was not demonstrated that it could be accomplished with economical results. With the exception of two factories in Kansas all commercial attempts at the manufacture of sugar from sorghum on a large scale have (1895) in a short time proved financial failures.

The difficulties attending the manufacture of sugar from sorghum depend on the presence of bodies such as starch, gum, non-crystallizable sugar, etc., which tend to prevent

its crystallization. These bodies can be largely separated from the sugars by treating the partially evaporated juices with alcohol. Experiments made by the department of agriculture in 1891 indicated that fully 200 lb. of sugar per ton could be made from sorghum in this way. The character of the U. S. internal revenue laws, however, prevents the use of alcohol except under such restrictions as would render it unprofitable.

Extensive experiments were conducted by the department of agriculture from 1888 to 1893 at Sterling and Medicine Lodge, Kan., in the improvement of sorghum as a sugar-producing plant. New varieties were developed and the content of sugar therein greatly increased. Seeds selected from canes with a high content of sugar were carefully propagated and continued from year to year in a direct line of descent. The most approved varieties of sorghum as thus developed are Amber, Folger, Colman, Collier, McLean, Link, No. 8X, No. 112, No. 161, and Orange.

Sorghum as a Food.—Sorghum produces seeds which are quite equal to ordinary cereals for food. The composition of sorghum seed is shown in the following table:

PARTS.	Seeds with glumes, per cent.	Seeds without glumes, per cent.
Moisture.....	9.93	9.63
Albuminoids.....	10.54	11.39
Petroleum spirit extract (oil).....	3.72	3.16
Ether extract.....	0.61	0.54
Eighty-per-cent. alcohol extract (sugar).....	2.91	1.78
Fiber.....	3.17	1.83
Ash.....	2.05	1.69
Starch and soluble carbohydrates.....	67.07	69.98

Each ton of sorghum will yield from 100 to 150 lb. of seed. Sorghum is also valuable as forage when sown broadcast and harvested as hay or preserved in silos. It is chiefly cultivated for this purpose in Southern and Southwestern Kansas and in many other of the semi-arid regions of the U. S., as it yields a crop which can be relied upon in all seasons. In all parts of the U. S. sorghum is cultivated in a small way for molasses-making. The method of cultivation is almost identical with that of maize, but the young plants require more care. The ripe canes are relieved of their seed-heads and blades and crushed in small three-roll mills usually driven by animal power. The expressed juices are treated with cream of lime heated to the boiling-point and the scums removed. The clear juice obtained is rapidly concentrated in kettles or shallow pans to the consistency of molasses, yielding when carefully controlled a wholesome and pleasant product.

Statistical.—The number of gallons of molasses made in the U. S. from sorghum in the census year 1860 was 6,749,123; in 1870, 16,050,089; in 1880, 28,444,202; in 1890, 24,235,219. In the last-named year 415,691 acres were cultivated in sorghum. The yield of sugar reported to the internal revenue for the purpose of receiving bounty for the fiscal year ending June 30, 1892, was 1,136,186 lb., for that ending in 1893 1,026,100 lb., and for that ending in 1894 882,572 lb. The average yield of cane per acre was 5.3 tons, and the average yield per ton of cane manufactured 82.5 lb. Much sugar is also made as an incidental product in the manufacture of molasses.

HARVEY W. WILEY.

Soricidae [Mod. Lat., named from *So'rex*, the typical genus, from Lat. *so'rex*, shrew]: a family of mammals of the order *Insectivora*, including shrews or shrew-mice. Externally they resemble mice, but are readily distinguishable by the longer and pointed snout. In contrast with the *Talpidae*, to which they are most nearly related, they present the following characters: The skull is long, narrow, and pointed; the zygomatic arch is lacking, and there are no post-orbital processes; the tympanic is ring-like; the tibia and fibula are ankylized; the halves of the pelvis do not meet; there is no cæcum; the teeth range in number from 26 to 36 (M. $\frac{3}{1}$, P. M. $\frac{1}{1}$, C. $\frac{1}{1}$, I. $\frac{1}{1}$ \times 2); the cusps of the upper molars are arranged in a W; the upper incisors are large and hook-shaped, the first lower incisors are usually directed forward; the cervical vertebrae have well-developed hypapophyses, and the dorsal and lumbar distinct hyperapophyses; the sternum has a broad but not keeled manubrium. The family is a very homogeneous one, and representatives are found in the entire northern hemisphere, and extend southward into India and Eastern Asia in the Old World and into Mexico in the New. The species are all small, and some of them are among the least of mammals. They have certain

glands near the fore limbs, on the sides, and behind at the base of the tail, in which is secreted a musky fluid. They feed not only on insects, worms, etc., but on such young vertebrates (birds, etc.) as they are able to overcome.

Revised by F. A. LUCAS.

Soris: the name given by Manetho to *Snofru* (*S-nefru-n*, *Snefru*), the first king of the fourth Egyptian dynasty. Little is known about the man himself except that he waged war in Sinai and opened the copper mines in Wādī Ma'arah, where the evidences of his labor are still visible. His tomb was the False Pyramid at Mēdūm, built of Mokattam limestone, well jointed, 115 feet high, but never completed. After death he was the recipient of divine honors, and evidences have survived which indicate that his cult continued throughout the remainder of Egyptian history. Monumental remains begin to be numerous from the time of Soris and his successors during the fourth dynasty, and the representations of scenes of private life preserved on the walls of tombs of the period (see MASTABA) show a remarkable degree of civilization. Unger (*Manetho*, p. 92) refers to Soris-Snofru the mention made by Macrobius (*Saturnalium contriviorum*, lib. i., 23, § 10) of Senemures or Senepes, whose name in turn has been compared by some with that of the Assyrian Semiramis. The entire identification is founded on conjecture.

CHARLES R. GILLET.

Sorites: See LOGIC.

Soroban: the Japanese abacus. It differs from the Chinese *su-an-p'an* in having, as a rule, only one bead on each wire of the upper or smaller division. It is used in the same way as the Chinese use theirs. See ABACUS.

Sorocaba: a town of the state of São Paulo, Brazil; on the Sorocaba river, a branch of the Tietê; 60 miles W. of São Paulo, with which it is connected by railway (see map of South America, ref. 6-F). It is the center of an important agricultural and grazing district, and is noted for its annual fairs, principally devoted to the sale of horses and mules; as many as 70,000 animals are sometimes placed on sale. Pop. about 12,000.

H. H. S.

Sorrel: any one of several sour-leaved plants, especially those of the diacious section, of the genus *Rumex* (family *Polygonaceæ*), to which genus the coarse herbs called dock also belong. The common sorrel of sterile fields is *Rumex acetosella*. Plants of the genus *Oxyria* (of the same family) are called mountain-sorrels. The wood-sorrels are of the genus *Oxalis* (family *Geraniaceæ*). There are numerous species of the genus *Rumex*, some of which are occasionally used as salad-herbs and as flavors for sauces. In Europe the sorrels, mountain-sorrels, and wood-sorrels are cultivated in gardens for table use. All these sorrels owe their sourness to the presence of oxalic acid and its salts.

Revised by L. H. BAILEY.

Sorrel-tree, or *Sourwood*: the *Oxydendrum arboreum*, a handsome tree of the U. S., found in Ohio and Pennsylvania and southward to the Gulf. Its leaves resemble those of the peach. They are sour, and from them a cooling drink is made for the sick. The wood is soft and very difficult to dry. It is sometimes planted as an ornamental tree.

Sorren'to (anc. *Surrentum*): town: in the province of Naples, Italy; situated on a small rocky peninsula on the south side of the Bay of Naples, protected from the sirocco by Monte Vico, and from the west wind by Monte Massa (see map of Italy, ref. 7-F). It contains an interesting church and numerous villas, with gardens of almost tropical luxuriance. It was a Greek settlement, was adorned with splendid temples during the Roman period, and after the fall of the Western empire was ruled by its own consuls and dukes. Of the old temples, a few fine marbles, mosaic pavements, etc., alone remain, besides the foundations. The climate of Sorrento, as agreeable as it is salubrious, the luxuriance of the vegetation, and the variety and beauty of the surrounding scenery, have made Sorrento one of the most frequented resorts in Southern Italy. There is a small coasting trade in the rich productions of the vicinity carried on by means of the little harbor. It is the birthplace of Torquato Tasso. Pop. about 6,090.

Sotades, sot'ā-dēz (Gr. *Σοτᾶδης*): Greek poet of Macedonia in Thrace; a composer of indecent farces, whose jest at the marital relations of Ptolemy Philadelphus and his sister Arsinoë cost the jester his life. Sotades has given his name to a variety of Ionic verses, the *Metrum Sotadeum*. The fragments have been collected and restored by G. Hermann. *Elementa Doctrinæ Metricæ*, p. 445.

B. L. G.

Solter = *See* *Proctor*.

Solterology [The script, solvation, derive of words seems a happy discourse, namely] that branch of theology which treats of the redemptive work of Christ. In its wider significance the term includes both the atonement which Christ made and its application through faith to individuals. Thus defined, it would comprise not only the doctrine of expiation, but also those of regeneration, justification, and sanctification. It is, however, used in a more restricted significance to denote only the atonement. See *ATONEMENT*.

Solthern, with son, EDWARD BREWER SOLTER; b. in Liverpool, England, Apr. 2, 1806. He disappointed his parents by not entering the Church; made his *debut* as an amateur actor in Jersey, went to the U. S. in 1832, and appeared first at the Boston National Theater, under the stage name of Douglas Shewry, created the character of Lord Dunsinore by the play of *Our American Cousin* at Laura Keane's Theater, New York, 1838, and represented it many hundreds of times with great popularity in the U. S. and in England. Favorite parts of his were David Garrick, in the play of that name, *Pete Almonst* in *The Crushed Fragments*, and *Stephen Bean*. Solthern was very popular socially, and a great practical joker. D. in London, Aug. 30, 1881.

Revised by D. B. YALOWITZ.

Sothic Period [Sothic is from Greek *Σόης*, Egypt, *Soet*, the dog-star]; a period of 1,460 Julian years (of 365½ days, equal to 1,360½ sacro-years (of 365 days) of the Egyptian calendar. In the latter the year was reckoned by twelve months of thirty days, with the addition of five intercalary days. The difference between the two thus amounted to about six hours annually, so that the vague year revolved about one day in each four years. The beginning of a Sothic period was marked by the coincidence of the heliac rising of Sirius with the calendar new year, and at the rate of divergence between the two systems this coincidence recurred once in about $4 \times 365 = 1,460$ solar years. In the course of a Sothic period any periodic event, such as the inundation of the Nile or the rising of the dog-star, fell upon each and every day of the civil calendar. The difference in the appearance of such periodic events was not marked in the life of an individual, being only about twenty-five days in a century. Consequently little attention was paid to the matter till, in the Ptolemaic dynasty, when the Sothic period seems first to have been used in calculating time.

Dr. Mahler, of Vienna, has employed the Sothic period in calculating Egyptian chronology, starting with the statement of Censorinus (599 A. D.) that the heliac rising of Sirius occurred on July 21, 109 A. D. Reckoning back, this event occurred on about the same day in (approximately) 1822 A. C., 4792 A. C., and 4332 A. C. By the use of monumental and other data he arrived at the conclusion that the reign of Thutmose III. extended from Mar. 20, 1538, to Feb. 14, 1449, A. C., a result agreeing remarkably with that derived from a "double reckoning" by lengths of reign as given by Manetho and the monuments. Similarly Perrot fixes provisionally the date of the beginning of the sixth dynasty at 3410 A. C., and, reckoning the preceding dynasties according to monumental and other evidence, he assigns the beginning of the first dynasty to the year 4777 A. C. There is uncertainty about this result, but it is apparently more exact than any given previously, and it is claimed that it reduces the margin of doubt from a thousand or more years in one or two hundred at the outside.

CHARLES R. GILBERT.

Sothia = another name of *SIRIUS* (q. v.).

Soto, HERNANDO DE FERRAZO, de; discoverer of the Mississippi river; b. at *donde de los Caballeros*, Extremadura, Spain, about 1500. He went to Darien with Pizarro in 1514, accompanied Cortés in the conquest of Nicaragua 1524, and opposed his subsequent rebellion. In Apr., 1532, he joined Pizarro with reinforcements; in the conquest of Peru he acquired great wealth, with which he returned to Spain in 1535. Soon after he was appointed governor of Cuba and Florida, with a commission to explore and settle the latter country; then including all the northern coast of the Gulf of Mexico. On May 12, 1509, he sailed from Havana with five vessels and 600 (or 950) men. His explorations began at Tampa Bay July 15; they covered a large area, and the route can now be determined only approximately. It is certain that he passed through Northern Florida, Georgia, probably South Carolina, and Tennessee, and perhaps North Carolina, before descending the Alabama

river. In Oct., 1540, he had a battle with the Indians near Mobile Bay; thence he again turned northward, and about May, 1541, crossed the Mississippi at the lower Chickasaw Bluffs; explored the river northward nearly to the Missouri, and returning southward, died of fever near the junction of the Mississippi and Red rivers, probably on May 21, 1542. During the three years' wanderings that men had perished of disease and privation or in battle with the Indians. The survivors, under Moscoso, descended the river and reached Mexico. Soto is properly regarded as the true discoverer of the Mississippi; Hernán Pineda found its mouth in 1519, and *Alonso de Vera* must have crossed it near the Gulf in 1538. HANMER H. SWAIN.

Sonari-and = *See* *CARACAS*.

Sonblotte, SONBLÖT, CARLOS, soldier and statesman; b. at Caracas, Venezuela, 1799. He joined the revolutionists in 1810, distinguished himself in the war for independence, especially under Bolívar in the New Granada campaign; attained the rank of general, was vice-president and general-in-chief in Venezuela 1821-33 and Minister of War for Colombia 1836-37. He supported Bolívar's attempt, in 1828, to maintain the union of Colombia, but when Venezuela seceded in 1830 he remained faithful to his native country, presided over the constitutional convention of that year, and was the Venezuelan Secretary of War 1839-44. In 1860 he was exiled to Spain, and was elected vice-president under Vargas; by the resignation of the latter man after he became acting president. He left the government with Narváez, and went on a special mission to Spain to arrange a treaty with that kingdom. In this he was unsuccessful. On his return he resumed the presidency, which he retained until Feb. 1, 1868. Under Páez, 1869-76, he was Secretary of War and he succeeded him as president Jan. 28, 1868, to Mar. 1, 1867. During the disorders of 1848 he was banished, residing at Bogotá until 1858. Subsequently he held cabinet positions, and commanded the Venezuelan army. He was greatly respected. D. at Caracas, Feb. 11, 1870. HANMER H. SWAIN.

Sondan = *See* *SONAS*.

Soul [G. Eng. *siel*, *seel*; G. H. Germ. *seele* (soul); Mod. Germ. *seele* (Goth. *ans seala*); a term variously used to signify either the principle of life in an organic body, or the first and most undeveloped stages of individualized spiritual being, or, finally, all stages of spiritual individuality, incorporated as well as corporated. Aristotle, whose treatise *De Anima* (*Περὶ ψυχῆς*) is the first and perhaps the greatest work on the subject, has himself introduced this confusion by defining the soul in one instance as the self-determining power (*συνεχὴς*) of an organized body, and then afterward attributing to it reason (*νοῦς*), and making it as reason entirely separable from body. If strictly limited to the phases of relation which the mind has toward its organic conditions, the science of the soul is properly termed anthropology, and treats first of the cosmic, sidereal, and telluric influences upon mind—the determining characteristics of race, age, the seasons, the climate, the solar and lunar periods, etc. Next comes the reaction against these determining influences of nature, as manifested in the antithesis of sex, the alternation of waking and sleeping, and in the phenomena of dreams, fetal life, somnambulism, clairvoyance, catalepsy, St. Vitus's dance, and the various forms of vicarious sense-perception (where seeing, hearing, tasting, etc., are performed by the organ of feeling, the skin, in diseased states of the organism), trance-exaltation, etc. It considers next the questions of arrested development, such as appears in idiosyncrasy; the return to the previous stages out of the stage of consciousness; and the mingling of the two (earlier and later) phases in insanity (wherein the Ego is unable to distinguish between the phenomena of sense-perception and those arising from the influence of general external conditions, or from diseased activity of the nervous organism, and is thus confused, now acting upon one set of data and then upon another. Through the stages of feeling and the reduction of external relations to the abstract uniformities of habit, and especially in the creation of conventionalities whereby language becomes possible, and with it the formation and expression of general ideas, mind rises into the phase of Consciousness and Reason, knows itself as individual and independent of external natural influences, and accordingly subordinates and eliminates these in manifold ways through institutions—family, civil society, state, church, science, etc.—and learns to recognize conscious immaterial personality as the highest principle of the universe. The much-debated question of the immortality of

the soul implies a definition of soul as including not only its phases of corporeal existence, but also the higher ones of thought and will. Hence if *ψυχή* (soul) be only the principle of organic life, and *νοῦς* (reason) be the principle of intelligence elevated above the former and transcending it, the immortality of the former is precluded by definition, for the principle of conscious individuality is placed in the latter.

Previous to Aristotle and Plato the theories regarding the soul were mostly crude suggestions. The Pythagoreans thought that the soul is a harmony—that it dwells in the body as in a prison, being confined there for punishment. Many conjectures as to the location of the soul have been made. Alcmaeon of Crotona (according to Theophrastus) taught that the soul was located in the brain, "whither all sensations were conducted from the organs of the senses through canals." Like other Pythagoreans he held that the soul was subject to eternal motion, like the stars. Philolaus the Pythagorean held that the soul is united to the body, which is its organ, and at the same time its prison, by number and harmony, all things being known through number as a common principle of the soul and of things—like being known by like. Anaxagoras attributed souls to plants, and affirmed that they sorrow and rejoice. Democritus, who explained everything through the "atom and the void," held soul and fire to possess "round atoms," because they manifested the maximum of mobility. He affirmed that thought arises when the motions of the soul are "symmetrical"; and, further, that "the soul is the noblest part of man; he who loves its goods, loves what is most divine. He who loves the goods of the body, which is the tent of the soul, loves the merely human." Critias the Sophist considered the blood to be the substratum of the soul. Plato (in the *Phaedrus*) makes three souls or phases of the soul: (a) the appetitive soul seeking happiness or sensual pleasure, the gratification of desire; (b) the irascible or courageous soul, manifesting itself in combative activity, as the former in passive receptivity; (c) the rational soul, which alone is immortal. The cognitive or rational soul is the soul in its totality, and the irascible and appetitive souls are merely phases of arrested development occasioned by the confinement of the body. The rational soul dwells in the head (agreeing with Alcmaeon), the irascible in the heart, the appetitive in the organs of nourishment and reproduction. Plato defines (*Leg.*, cap. 10) the soul as a self-moving activity (*κίνησις αὐτῆς κινούσα*). Transmigration of souls (*Phædo*), a doctrine apparently borrowed from Egypt and the Orient, is consonant with his theory of the pre-existence of the soul, and of the origin of the appetitive and irascible phases of the soul through the descent of the rational soul into a body. Having made the discovery of general and necessary ideas, which could not have originated in sense-perception, he undertook to account for them through reminiscence; the soul had perceived them in a former life. These ideas, *a priori*, were simple and eternal: how could the soul in which they were contemplated be other than simple and eternal? While he condemned the Pythagorean view that the soul was a harmony, Plato employed symbolic expressions quite similar. In the same spirit his successor in the Academy, Speusippus, defined the soul as "extension, shaped harmoniously by number"; hence as, in some higher sense, a unity of the arithmetical and geometrical. So, too, Xenocrates of Chalcidion, the second director of the Academy, taught that the soul is a self-moving number. Aristotle repudiated the use of symbolic language in definitions to avoid ambiguity. He defined soul (*De An.*, ii., 1) as "the first entelechy [self-actualizing energy] of a physical, potentially living and organic body." The first entelechy is not a fully realized being, and hence it has been inferred that he intended to exclude the reason (*νοῦς*) from his definition of the soul, especially, too, as he makes the *νοῦς* to be independent of the body. But in another place he makes the soul to be "that by which we live, feel or perceive, move, and understand." The *νοῦς ποιητικός* = the *actus purus*, or pure reason, exists before the body, and enters it from without (*θύραθεν*) as something divine and immortal (*De Gen. et Corr.*, ii., 3). The *νοῦς παθητικός* = passive reason, including the nutritive (vegetable), sensitive (animal), and so much of the rational soul as includes memory, imagination, sense-perception, and discursive intellect, he regarded (*De An.*, ii., 2) as perishable like the body. Exactly what he meant by this was long in dispute. Alexander of Aphrodisias, the great commentator, held that the active reason is the world-soul, and that individuals are mere incarnations of it which

perish with the body. Dicaearchus of Messene, pupil of Aristotle, had held this doctrine. The Stoics had held nearly the same doctrine, acknowledging that the soul outlives the body, but is not eternal. Cleanthes the Stoic asserted that all souls would exist until the general conflagration of the world; but Chrysippus limited this to the souls of the wise, while Panætius denied the future life altogether. The statements of Aristotle, taken together, indicate his belief in the existence of the soul independent of the body; and not merely as a general world-soul, but also as individual souls.

In the process of education, culture, or self-development the individual gradually eliminates his lower phases of thought; he depends less upon sense-perception, learning to know a great deal from seeing very little (Cuvier could describe the whole animal from one of its bones; Agassiz, a fish from one of its scales); mechanical memory likewise becomes less important as deduction from principles becomes more prominent; discursive intellect gives place to pure intellect. Thus the lower faculties die out, and give place to more perfect forms; they become useless in the presence of more adequate forms of cognition. Hence Aristotle was correct in describing them as transient and perishable like the body; and yet he did not at all deny, by this, future conscious identity to the individual. The active reason could energize as nutritive, locomotive, appetitive, and sensitive, organizing a new body; for organization was only a self-limitation of the active reason, a self-arrested development of it. Hence when Averroës revived the doctrine of Alexander of Aphrodisias, the great scholastic thinkers devoted themselves to this question until they reconciled Aristotle with himself through this theory of the union of the active and passive reasons—the former as independent and substantial, and the latter as eternally produced through its energy. Albertus Magnus held that the active reason bears within itself the vegetative, sensitive, appetitive, and motive faculties. Thomas Aquinas held, similarly, that as the soul is immaterial, it can not be destroyed through the removal of its substratum. The form-producing principle of the body, the vital force, the appetitive, sensitive, and motive powers, belong to the thinking substance, and do not inhere in the body; hence are immortal. Pure thought acts without organs; the lower functions of the soul act with organs created for temporary manifestation. This view substantially agrees with that of the Neo-Platonists, except as to the origin of the soul. "The soul is immaterial, and whole or entire in every part of the body"; this statement is constantly repeated by thinkers since Aristotle. Plato's doctrine of pre-existence and reminiscence is indorsed by some of the Platonizing Christian thinkers like Origen, Synesius, and Nemesius, but is generally repudiated, as by Arnobius, Justin Martyr, Gregory of Nyssa, St. Augustine, Æneas of Gaza. With Descartes, thinking substance is sharply distinguished from matter that only divine intervention will account for their interaction. Geulincx, Malebranche, and Leibnitz presented different solutions of this dualism, but Spinoza boldly denied it altogether, making mind and matter two attributes of one substance. La Mettrie, a pupil of Boerhaave, observing the effect of the increased circulation of the blood upon his thoughts during a fever, concluded that psychological functions are all to be explained by the organization of the body. Diderot held that atoms are endowed with sensation, and that when combined in the animal organism they become conscious, thus reviving the doctrine of Democritus and Epicurus, who made the soul material, and perishable upon the separation of its constituent atoms. Carl Vogt makes the phenomena of the soul to be functions of the brain and nerves. Moleschott and Büchner have promulgated and popularized the same doctrine. Kant endeavored to show that the metaphysical argument which proved the immortality of the soul from its nature as simple substance is a paralogism, because the Ego which thinks is subject only, and does not appear as object in consciousness. Herbart, however, defends the idea of the soul as a simple, spaceless essence; and his disciple, Beneke, expounds the same doctrine. Trendelenburg returns to the Aristotelian definition: "The soul is a self-realizing, teleological idea; not a result, but a principle." At present there is a very great activity on the part of the physiological school of writers, who are engaged in investigating the physical correlates of psychological action. See articles on PSYCHO-PHYSICS, PSYCHOMETRY, PSYCHOLOGY, HYPNOTISM, IMMORTALITY, and other special topics relating to the soul.

WILLIAM T. HARRIS.

Soutle, James, II, D.: b. at Bristol, Mo., Aug. 1, 1871; was licensed as a Methodist preacher 1799; was preaching elder of the Maine district 1894-10; was author of one plan for a designated general conference of his Church, adopted at Baltimore 1899; was editor of *The Methodist Messenger* (1896-99); declined a bishopric 1899, but was again elected and accepted 1924; resided for several years at Johnson, N. J.; was a delegate to the British Western Conference 1922; adhered to the Methodist Episcopal Church south of the division of the Church 1944; settled at Nashville, Tenn.; visited California on an episcopal tour 1951-52; continued active in the discharge of the duties of the post until his death at Nashville, Mar. 6, 1967.

Soutle, Louis, Prunus: U. S. Senator; b. at Castillon, France, in Sept., 1802; educated for the Roman Catholic priesthood in the Jesuit college at Toulouse; studied afterwards at Bordeaux. Being implicated in a conspiracy against the government of Louis XVIII, he fled to a village in Navarre, where for more than a year he followed the occupation of a shepherd; then went to Paris, became a writer for a republican newspaper, *Le Nain*; was imprisoned in the *Châtelet* for an attack on the ministry; escaped to England; returned to the U. S. and settled at New Orleans 1829; was U. S. Senator 1847-52 and distinguished for extreme Southern views; was appointed minister to Spain 1858; had a duel with the French ambassador at Madrid; took part in the Orem conference of Oct., 1854, intended to facilitate the acquisition of Cuba; returned to the U. S. 1855; opposed the secession of Louisiana, but ultimately adhered to the movement, and visited Europe as Confederate agent 1861; was imprisoned for disloyalty at Fort Lafayette 1862; was released on condition of leaving the country; went to Europe, where he remained six years; returned to Louisiana 1869. D. in New Orleans, Mar. 16, 1870.

Soutle, Louis-F. Marthe, Faintre: novelist and poet; b. at Yver, department of Ardèche, France, Dec. 23, 1800; studied law; made his debut in literature in 1824 with a volume of poems, *Amours français*, which passed by almost unnoticed, and wrote in 1828 *Bonnie et Juliette*, and in 1831 *Christine et Pauline*, which had much effect on the stage. Others of his dramas were also successful—*Chloé* (1832) and *La Comtesse des Bœufs* (1846); but it was principally as a novel-writer that he became famous. He wrote about 120 volumes of novels, some of which became very popular, such as *Le Comte de Toulouse* (1835); *Un Rêve à Meulan* (1836); and *Mémoires du Diable* (1837-38). D. at Béziers, near Paris, Sept. 23, 1847.

Revised by A. G. CANNELL.

Soulouque, Achille, Faustin Elie: soldier and politician; b. at Petit Goyave, Haiti, about 1785. He was originally a Negro slave; took part in the early insurrections and in the civil wars on the side of the blacks; rose to be general of division, and, owing to his race and long services, possessed great influence with the Negroes. On Riché's death the senate elected Soulouque president Mar. 1, 1847. Apparently the senate had imagined that he would be their last ruler, owing to his age and ignorance; but he displayed unexpected energy, and his leadership of the blacks soon gave him dictatorial power. In Mar.-Apr., 1849, he invaded the Dominican Republic, but was repulsed. Notwithstanding this reverse he was able to have himself proclaimed emperor Aug. 20, 1849, and was crowned as Faustin I. in 1850; he promulgated a constitution, but practically had despotic power. His rule in some respects was wise, but his persecution of the mulattoes was unrelenting. In 1855 he was disastrously defeated by Santana in a second invasion of the Dominican Republic. In Jan., 1859, a successful revolt of the mulattoes under Gelfand drove him into exile at Jamaica. He was allowed to return in 1867, and died at Petit Goyave, Aug. 6 of that year. H. H. SMITH.

Soutle, Louis, Nicolas Jean de Dieu, Duke of Dalmatia: soldier; b. Mar. 29, 1769, at St.-Amans-la-Bastide, department of Tarn, France; the son of a farmer; entered the ranks of the army in 1785; became a captain in 1790, brigadier-general in 1794, general of division in 1799, and marshal of France in 1804. He distinguished himself greatly in the battles of Austerlitz and Jena, and was made Duke of Dalmatia after the Peace of Tilsit. He was then placed in command of the second corps in Spain, and succeeded in driving the British to evacuate the country. In 1809 he became commander-in-chief, and soon afterward gained the victory of Ocaña. On 1811 he lost the battle of Albuera, and, discouraged by his reverses and the obstinacy of Joseph

Bonaparte, obtained his recall, but after the defeat of the French and Spanish at Vittoria was again placed in command. Though he displayed great skill and energy he was compelled to retreat into France, and was defeated at the Pyrenees and before Toulouse. Made Minister of War during the first restoration, he joined Napoleon during the Hundred Days, and lived in exile at Busschfort from 1815 to 1819; allowed to return in the latter year and reinstated in his dignity in the army, he soon won the favor of Charles X., and was made a peer of France in 1827. Under Louis Philippe, between 1831 and 1847, he was several times Minister of War, Minister of Foreign Affairs, and president of the cabinet, but in 1847 retired from public life, having been made a marshal-general of France—a dignity which had been conferred previously only on Turan and Villars. D. at St.-Amans, Nov. 26, 1851. The first part of his *Mémoires* was published by his son in 1854, in three volumes.

Sound: See ACOUSTICS.

Sound, Diffraction of: the deviation of sound waves in passing an obstacle. It was shown by Huyghens, in 1690, that if a wave be propagated in an elastic medium each point in the wave-front is a center from which secondary waves are propagated. If the main wave passes an obstacle, the edge of this serves as a center around which the secondary waves become perceptible. The extent of this deviation depends jointly on wave-length and velocity of propagation, increasing with wave-length and diminishing with velocity. It follows that a mathematical shadow is not possible, but in the case of light the waves are so short, and they are propagated so rapidly that the deviation due to diffraction is exceedingly small. Sound-waves, on the contrary, may be many feet in length, and the rate of propagation through air is only about a fifth of a mile per second. To render acoustic diffraction effects perceptible the waves must be very short, and this implies high pitch.

Lord Rayleigh was the first to demonstrate the diffraction of sound with any approach to exactness. (Royal Institution lecture, Jan. 20, 1888.) The source of sound was an adjustable whistle, or siren-call, the pitch of which exceeded 20,000 vibrations per second. This exceeds the limit of audibility for the average ear, and therefore a sensitive flame was employed as an indicator. An acoustic diffraction grating served to bring sound-waves to a focus, as light is focalized with a lens. Stevens (*American Journal of Science*, Apr., 1889), using the flame-indicator and a whistle giving 12,000 vibrations per second, succeeded in mapping out the lines of interference produced by diffraction behind a screen, through which two openings had been made for the transmission of waves. Also artificial bands of noise and silence were traced out with the flame, these being produced by interference of direct and reflected waves of sound from the whistle. The position of these bands was found to accord well with the results of calculation based on the theory of interference.

W. LEON STEVENS.

Sound, Refraction of: See REFRACTION.

Soups and Broths: See COOKERY.

Souris: part of entry of King's County, Prince Edward Island, Canada; on both sides of the mouth of the river Souris, which has a bar with only 84 feet of water at high tide (see map of Quebec, etc., ref. 1-C). There are two villages, East and West Souris. The town has a U. S. consular agent and a grammar school. Fishing and ship-building are carried on. Pop. 700.

Sour-sop: the fruit of the *Annona muricata*, a beautiful tree of tropical America. The sour-sop often weighs 2 or 3 lb. Its taste is sour and pleasant. It is very soft and white, and is much eaten in the West Indies.

Sourwood: See SORREL-TREE.

Souza, or Souza, so/za, Martin Affonso, de: soldier and colonizer; b. at Bragança, Portugal, about 1590. He was of noble family, and a member of the royal council. In 1590 he was placed in command of five vessels and 400 men, with orders to explore the coast of Brazil and plant there a permanent Portuguese colony; at the same time he was created governor of New Lusitania, or Brazil, was then officially named, and was empowered to distribute lands. After a careful survey, extending to the Rio de la Plata, he founded the first Portuguese colony, São Vicente (near the modern Santos), Jan. 22, 1532; soon after, Piratininga, now São Paulo, was founded by his orders. He then returned to Portugal, and on his recommendation the Brazilian coast was divided into the hereditary captaincies, which, with various

changes, were the bases of the modern states. Martim Afonso himself received a grant of the most important of these captaincies, that of São Vicente, then comprising all of Southern Brazil. He did not personally return to it, but it flourished under governors whom he selected. He was admiral of the seas of India 1534-40, and gained there several brilliant victories; in 1542-45 he was governor of the Portuguese East Indies. D. in Lisbon, July 21, 1564.

HERBERT H. SMITH.

South, ROBERT, D. D.: preacher and controversial writer; b. at Hackney, London, England, in 1633; studied as a king's scholar at Westminster School under Dr. Busby; entered Christ Church, Oxford, and graduated 1654 (D. D. 1663); took orders in the Church of England 1658; was university orator 1660; became chaplain to the Earl of Clarendon and tutor to his children 1661; was made prebendary of Westminster 1663; chaplain to the Duke of York 1667; canon of Christ Church 1670; chaplain to Lawrence Hyde (afterward Earl of Rochester) 1676, and accompanied him on an embassy to John Sobieski, King of Poland, 1677; became on his return rector of Islip, Oxfordshire, 1678, and soon afterward chaplain to King Charles II.; was a vigorous advocate of passive obedience and of the divine right of kings, and a powerful opponent of Dissenters, and was esteemed one of the most eloquent preachers of the time. D. in London, July 8, 1716. He caused much talk in his time by his controversial publications against Rev. Dr. William Sherlock, dean of St. Paul's, whom he accused of tritheism. He published collected editions of his sermons (London, 1692, 6 vols.; 4th ed. 1715; new ed. enlarged 1744, 11 vols.; edited by W. G. T. Shedd, New York, 1867, 5 vols.). See his complete works, with memoir (Oxford, 1823, 7 vols.; new ed. 5 vols., 1842). A selection, with memoir, appeared in London 1867.

Revised by S. M. JACKSON.

South African Republic, formerly Transvaal' Republic: one of the independent Boer states in South Africa, lying between the Vaal river on the S., the Limpopo river on the N., between the Portuguese coast possession on the E., and British Bechuanaland on the W. By treaty with Great Britain (1884 and 1890) the New Republic formed by the Boers in Zululand, and a small part of Swaziland and Amatongaland, were added to the South African Republic, which has an area of 113,642 sq. miles and a white population (estimated 1895) of about 200,000. The black population is estimated at about 375,000, East Bechuanas and various other Kaffir tribes. On Feb. 21, 1895, Swaziland was annexed to the republic. It has an area of 6,150 sq. miles, and a population of 60,000 natives, besides 600 (in winter 1,500) whites.

Physical Features, Products, etc.—The country is a healthy, high, and undulating plateau, with wide-spreading hill and mountain features extending through the interior, from the southern border almost to the northern frontier. It is abundantly timbered near its eastern border. Its western and northwestern portions are steppe-like in character. Its best agricultural resources are found on the high, well-watered plains of the southern portion, and the greater part of the country is well adapted for farming and stock-raising.

The Boers are pre-eminently stock-raisers and their sheep and cattle form their principal wealth. Great as the resources of the country are, the Boers are not yet able to supply all the food required by the enormous influx of gold-miners. About 50,000 acres are (1895) under cultivation.

The southern and southeastern districts are the greatest centers of South African gold-mining, and in a few years have made South Africa the third largest gold-producer in the world. The output in 1892 was 1,325,394 oz., by far the greater part of which came from the Witwatersrand and Barberton districts; in 1893, 1,610,335 oz.; in 1894, about 2,200,000 oz. In 1886 the site of Johannesburg on the Witwatersrand was occupied by a few huts where now (1895) stands a city of 50,000 inhabitants. The capital is PRETORIA (*q. v.*). Excellent coal is also found; lead and silver are being mined, and there are rich resources of iron. In its mineral and agricultural resources the republic is one of the richest regions of like extent in the world, but, except in gold-mining, little has yet been done to develop its natural wealth.

The total mileage of railways open in Sept., 1894, was 422, under construction 391, and projected 473. The line from Capetown to Kimberley has been extended to Pretoria. The extension of the Natal line from Charlestown

on the southern frontier to the capital was to be opened in 1895, and the railway from Delagoa Bay was being built W. toward Pretoria. The more important articles of export are gold, wool, cattle, grain, skins, leather, fruit, tobacco, butter, brandy, ostrich-feathers, ivory, silver, lead, and copper. The revenue and expenditure in 1894 were £1,859,582 and £1,595,757, respectively; imports, 1893, £5,371,701, exports about £5,000,000. The public debt on Sept. 15, 1894, was £9,458,966.

History.—For the early history of the Boers, who are of Dutch and Huguenot descent, see CAPE COLONY. A number of them, who had left Cape Colony for Natal, again removed from under British rule and founded the South African Republic, which was recognized as a free state by the British, in 1852. In consequence of trouble with the natives it was annexed by the British in 1877; but in 1880 the Boers revolted, and in 1881 the retrocession of the country took place under British suzerainty, which underwent a modification in 1884. Since then there has been a great immigration of British subjects, who form (1895) the majority of the whites; and considerable difficulties have arisen from the attempts of the Government to enforce military service on them, though they are debarred from the franchise. There have been frequent wars with the Kaffirs, who in 1894 suffered a severe defeat Aug. 29.

See Greswell, *Geography of Africa, South of the Zambezi*; Keltie, *The Partition of Africa*; Mather, *Zambesia*, and Silver, *Handbook of South Africa*. C. C. ADAMS.

South Amboy: borough (founded in 1835); Middlesex co., N. J.; on Raritan Bay at the mouth of the Raritan river, and on the Penn., the N. Y. and Long Branch, and the Raritan River railways; 37 miles S. W. of New York city, 60 miles N. E. of Philadelphia (for location, see map of New Jersey, ref. 3-D). It is a large coal-shipping point, and contains Baptist, Methodist Episcopal, Methodist Protestant, Presbyterian, Protestant Episcopal, and Roman Catholic churches, two large public schools, a large Roman Catholic parochial school, asphaltum-works, several potter's, clay-pits, sand-pits, a national bank with capital of \$500,000, and a weekly newspaper. Pop. (1880) 3,648; (1890) 4,550, (1895) estimated with enlarged territory, 5,000.

M. N. ROLL, EDITOR OF "CITIZEN."

South America: See AMERICA, SOUTH.

Southampton, county of England: See HAMPSHIRE.

Southampton: seaport in Hampshire, England; on a peninsula, at the head of Southampton Water; between the estuaries of the Test and Itchen; 23 miles N. W. of Portsmouth and 79 miles by rail S. W. of London (see map of England, ref. 13-H). Of the walls built in the time of Richard II. there are considerable remains, and four of the seven gates are well preserved. Southampton contains many old buildings, among which is the *Domus Dei*, an hospital dating from the thirteenth century; also St. Michael's church (1080), since altered and restored. Among modern structures are the Watts Memorial Hall (1876); St. Mary's Church, designed by Street; and the Hartley Institution, a college with thirteen teachers. The old docks (1842 and 1851) have been greatly improved and extended, and a new tidal dock, 18 acres in extent, was opened in 1890. There are also four dry docks. A graving-dock, the largest in Great Britain, was opened in 1895. Mail steamers for the U. S., the West Indies, Brazil, and South Africa arrive and depart here, and vigorous efforts have been made to compete with Liverpool in this respect. There are large exports of British manufactures. Provisions, etc., from France and the Channel islands, and cattle from Spain and Portugal are imported. In 1893 the total tonnage entered and cleared exclusive of that coastwise, was 2,130,753. Ship-building and the manufacture of engines are carried on. About a mile N. was the Roman station of Clausentum. The present town was founded by the West Saxons soon after 495; it is mentioned as Hantune in Domesday Book. The parliamentary borough returns two members. Pop. of the municipal borough (1891) 65,325.

R. A. ROBERTS.

Southampton (P. O. name SAUGEEN): a port of entry of Bruce County, Ontario, Canada; at the mouth of Saugeen river, on Lake Huron; 60 miles N. by E. of Goderich (see map of Ontario, ref. 3-C). It is the northwest terminus of the Wellington, Grey, and Bruce Branch of the Grand Trunk Railway. Grain and lumber are the chief exports. Pop. 1,300.

Southampton: village (incorporated in 1894); Suffolk co., N. Y.; on the south shore of Long Island, between

Spencer Bay and the Atlantic Ocean, and on the Long Island Sound, 50 miles E. by S. of New York (see map of the state of New York, vol. 9, p. 1). It is the oldest English settlement in the state of New York, was known to the Indians as *Aganem*, settled by colonists from Lynn, Mass., in 1647, and governed till 1815, when it attached itself to Ontario; granted to the Duke of York by Charles II. in 1694; and has since belonged to New York. It was occupied by the British during the Revolutionary war, and has a well-protected fort of that period. The village contains 4 churches, graded public school, kindergarten, Rogers Memorial Library (incorporated in 1865), building erected in 1865), a State house with capital of \$35,000, a hall, electric lights, and a waste-removal system. It is principally engaged in agriculture, law, and the works, and is a popular summer resort (Pop. (1904) 1,800).

C. J. J. JAMES, Ph. D., editor of "SKANSKE TIMES."

Northampton, Henry Wainwright, Third Earl of; maker of the Duke of Devonshire, was a patron of Shakespeare, who dedicated to him the poems *Venus and Adonis* and *The Rape of Lucrece*. He was a friend of the Earl of Essex, whom he accompanied to Italy, and in 1599 to Ireland; was accused of complicity in the treasonable designs of Essex; protested his innocence; was convicted, and sentence of death and attainder was pronounced, but Elizabeth reprieved the destitute, and the attainder was removed by Parliament soon after the accession of James I. He was an ancestor of the palatine of settlement of Sir Walter Raleigh, and took a prominent part in the early colonization of America, and in the second charter of Virginia his name occupies a leading position, and he became the governor of the Virginia Company. In Parliament he was a firm supporter of liberty; and in 1621 was committed to close custody by the king, but was released through the influence of Buckingham. He soon after went, accompanied by his son, Lord Wrotham, to the Netherlands, to aid the Dutch in their struggle against Spain, and took command of a regiment. D. at Bergen-op-Zoom, Holland, Nov. 10, 1624.

Southard, Samuel Lewis, LL.D.; U. S. Congressman; son of Henry Southard, also a Congressman; b. at Haverhill, N. J., June 9, 1797; graduated at Princeton 1814; taught school in New Jersey, and was a family tutor in Virginia several years, during which time he studied law and was admitted to the bar; settled at Flemington, N. J., 1811; appointed law-reporter by the Legislature 1814, associate justice of the Supreme Court 1815; was U. S. Senator from Jan. 22, 1821, to 1823, serving a considerable time as *pro tempore* of that body; was appointed by President Monroe Secretary of the Navy 1823; was acting Secretary of the Treasury four months 1825, and for a short time acting Secretary of War; was chosen attorney-general of New Jersey 1829; Governor 1832; U. S. Senator 1833; resigned May 3, 1842. He became a trustee of Princeton College 1852, and soon afterward of the Theological Seminary, and was offered, but declined, the Whig nomination for Vice-President on the ticket with William H. Harrison. Shortly before the post of President, to which he would have succeeded by Harrison's death, on which occasion, however, he was for the second time chosen *pro tempore* of the Senate. D. at Fredericksburg, Va., June 26, 1842.

South Australia: one of the seven British colonies of Australia, occupying a central north and south band of Australia, from the Arafura Sea to the Southern Ocean, with Queensland, New South Wales, and Victoria on the E. and Western Australia on the W.; between the parallels of 11° S. and 38° S. (see map of Australia). The meridian of 120° E. forms the western boundary; on the E. the boundary is the meridian of 134° from the Gulf of Carpentaria S. to 26° S. thence westward it is the meridian of 141° E. The greatest length is 1,850 miles N. and S., and the average breadth 650 miles. It also embraces a number of islands, of which the largest are Kangaroo Island (1,700 sq. miles), off the mouth of St. Vincent Gulf in the Southern Ocean; Melville Island 180 miles long by 50 broad; and Bathurst Island, both off Port Darwin, in the Arafura Sea; and Groote Eylandt about 40 miles in each direction in the Gulf of Carpentaria. Total area, 903,089 sq. miles. The district N. of the parallel of 20° S. is called the Northern Territory.

General Configuration.—South Australia has a coast 2,000 miles long, of which 1,160 miles are on the Southern Ocean, the large part on the desolate shores of the great Australian Gulf, which has a few minor bays, as Port Eyre and Denial, Sandy, Nessley, and Coffin Bays. On the meridian of 137°

E. the shore is broken by the great Spencer Gulf, extending N. 200 miles, with a greatest width of 50 miles, and in the extension of its axis, but not connected with it, are Lake Torrens and the Eyre lakes, two of them the largest lakes in the colony. On the west side of Spencer Gulf the country is arid and infertile, but on the east it is fertile and has great mineral wealth. Further E. is the smaller St. Vincent Gulf, separated from Spencer Gulf by Yorke Peninsula and sheltered at its mouth by Kangaroo Island. The country to the E. is the most thickly populated in the colony and contains Adelaide the capital. Next E. is the broad shallow Kinnear Bay, and behind its low sandy shores are Lakes Alexandrina and Albert, expansions of the Murray river and connected with them the long, slender, coastal lagoon called Coorong.

The northern coasts about the great northern peninsula between the Indian Ocean and Gulf of Carpentaria are generally level, very irregular, in places a continuous series of bays separated by peninsulas of odd and irregular forms. The chief port is Port Darwin, a narrow, deep bay near the northwestern angle of the peninsula, opening on Clarence Straits just S. of Melville Island. On it is situated Palmerston, the capital of the Northern Territory and terminus of the transcontinental telegraph line and proposed transcontinental railway line.

The interior is little known, but in the center is a mountainous region, with the ranges running nearly E. and W., and rising generally but slight elevations, rarely surpassing 3,000 feet anywhere in the colony. The volcanic, and range seems to be the McDowell, nearly under the Tropic of Cancer. To the S. of the central mountain is a great district with many bodies of water which are called lakes, and occupy much space on the map, but are really salt-water lagoons. W. of the mountains and lagoon districts and along the whole western boundary is an arid, infertile, desolate region forming an extension of the Great Victoria Desert, the Gibson Desert, and the Great Sand Desert of Western Australia. The northeastern part of the great northern peninsula, or Arnhem Land, is an elevated plateau sloping gently toward the east and abruptly toward the north. To the W. of it the country is better watered and more fertile.

Very few of the streams of the colony reach the sea, and the most of these are in the Northern Territory. The largest are the Roper river, which empties into Linnam's Bay, the Daly river, which contributes to Anson Bay, and the Victoria river, the largest on this coast, which empties into Queen's Channel. At less than 50 miles from its mouth it degenerates into a series of ponds, and fails to flow except in the rainy season. On the south coast the Murray passes for a short distance in its lower course through this colony, and, after expanding into Lakes Alexandrina and Albert, forms only a small and shallow stream over the alluvial sands. It resolves in important tributary in the colony. A few small streams empty into St. Vincent and Spencer Gulfs, but from the extreme of Eyre's Peninsula to the western boundary, along the Australian Right, there are no streams. The interior streams are insignificant except at times of flood. They are lost in the sands or find their way at high water to some of the lakes. They drain a great interior basin which, though it reaches within a few miles of the sea at the northern extremity of Spencer's Gulf, never contributes to it, nor apparently has it done so in the present geological period. The basin is broken up into several secondary basins which seem to be remnants left by progressive aridity.

Climate.—The temperatures in the settled districts about Adelaide are those of Southern France and Northern Italy. The winter mean temperature is from 50° to 55° F. near the coast, but ice forms inland at slight elevations with light frosts on the plains. The summer has a moderate mean temperature (65° to 70° F.), but the clear skies, dry air, and hot winds from the interior make it disagreeable, with high shade-temperatures daily. The Northern Territory is tropical and hot, resembling Guinea, Guinea, and Central America, and in the interior the Sahara. The rainfall is less than 5 inches annually over the interior from lat. 20° S. to lat. 32° S., and gradually increases to the southward to 30 inches and to the north to 60 inches. At Adelaide there are 120 days of rain annually, yielding 21 inches. On the northern coast the annual rainfall may reach 65 inches. Over most of the Northern Territory the rainy season is January and February, when the rain is very heavy; in the southeast there are summer and winter rainy seasons; and in the arid interior rain is very irregular in occurrence, sometimes lacking

for years, at others coming in torrents for a few minutes or an hour or two. In general the colony is very healthful for colonists, but the northern coasts have the usual malarial diseases of a virgin tropical soil, with heavy rainfall. These are found to disappear in time after the soil is cultivated.

Minerals.—The mineral products of South Australia for 1892, and the entire production to the end of 1892, with the percentage of the total Australasian product, are given in the following table:

MINERALS.	IN 1892.		TOTAL TO END OF 1892.	
	Value.	Per cent.	Value.	Per cent.
Gold.....	£226,284	0·020	£1,430,622	0·004
Silver.....	101,727	0·007
Copper.....	175,535	0·582	20,162,292	0·773
Tin.....	2,438	20,812	0·001
Coal.....
Other minerals.....	2,769	0·006	402,824	0·134
Totals.....	£216,079	0·025	£22,118,236	0·049

The most important mineral product is copper, and the colony owes its continued existence at a critical time to the opportune discovery of the famous Burra Burra copper-mining district, 90 miles N. of Adelaide. The mines were developed in 1845 and for some years paid their owners 800 per cent. on the investment, but were temporarily abandoned in 1864 because of the difficulty of transport, and reopened on the construction of the railway from Adelaide to Kuringa. There is a rich and large copper district 300 or 400 miles N. of Adelaide. Gold is obtained from mines in the southern hills S. of Adelaide (at Echunga, etc.), at Wakaringa, about 225 miles N. of Adelaide, and at other places, but chiefly from the Northern Territory, where there is a large alluvial and auriferous quartz region 100 to 150 miles S. of Port Darwin. Gold was discovered in the colony in 1852, the year after the rush to the Ballarat fields. The production of silver, never large, has nearly ceased. Among the other valuable or interesting minerals may be mentioned iron, marble, gypsum, mica (in the McDonnell range), garnets, and coorongite, an elastic mineral similar to elaterite, discovered in the Coorong lagoon on Encounter Bay.

Agriculture.—South Australia is essentially an agricultural and pastoral country. The value of the crops for the season 1892-93 was approximately £3,327,286, less than the corresponding values in Victoria, New Zealand, and New South Wales, but more than for the other Australasian colonies. The value of the crop per acre was £1 12s. 8d., the least in the seven colonies, the greatest being Tasmania, where it is £5 15s. 1d.; but the value per head of population was nearly £10, the greatest in the seven colonies. In the season of 1892-93 the total area under crops was only one-third of 1 per cent. of the area of the colony, or 2,037,653 acres. Three-quarters of this was in wheat, 21 per cent. in hay, and only fractions of 1 per cent. in each of the other crops—vines, oats, barley, and potatoes. The area of land under cultivation has increased fivefold since 1861, about the same ratio as that throughout Australasia. Wheat is the staple crop, but the production per acre was only 6·1 bush. in 1892-93, while it was 22 bush. for New Zealand, and nearly 11 bush. for all Australasia; yet owing to favorable conditions of culture 7 bush. in South Australia is considered a satisfactory crop. The colony exported 4,000,000 bush.—as wheat or flour—in 1892. The average yield for oats was 11 bush. per acre, for barley 13 bush., for potatoes 4 tons (worth £10), of hay less than 1 ton per acre. Considerable attention is paid to the vine. In the season of 1891-92 594,000 gal. of wine and 3,640 tons of table-grapes were produced. About 80 gal. of wine per acre was the product for bearing vineyards—about that of Italy and Hungary.

The importance of irrigation has long been recognized in the other colonies, but only recently has it been attempted on a large scale in South Australia. In 1888 a private company began operations at Renmark, on the river Murray, close to the boundary of New South Wales, where an area of 250,000 acres was set apart for this purpose. Search for artesian sources of water has been carried on successfully. On the Nullarbor Plain, a part of the Victoria Desert, and near the shores of the Australian Bight, a well was drilled 777 feet and yielded 68,000 gal. per diem, and other wells have since brought water near to, or above, the surface. More successful are the wells near the central portion of the colony, and those at Herrgott Springs, Coward, Strangways, and Lake Harry give from 50,000 to 1,200,000 gal. a day.

The live stock possessed by the colony in 1892 gave a product valued at £3,086,930, or about 6 per cent. of that for all Australasia, and £9 6s. 5d. per head of population. Over 40 per cent. was given by the wool-clip alone. The number of animals in 1893 was: Sheep, 7,325,003; cattle, 675,244; horses, 201,484. In general, the number of stock is increasing nearly 3 per cent. yearly, and somewhat less rapidly than the population, but the number of swine is decreasing. The number of animals held by this colony is from 5 to 7 per cent. of those of Australasia, except the horses, of which the number is 11 per cent. The capacity of the colony for sheep is probably nearly reached, as the area adapted for them is relatively small and is being encroached upon by tillage. Should the expectation of finding artesian water over the arid regions generally be realized, however, an enormous area of land now worthless would be easily rendered suitable for tillage and pasture.

Population.—The population in 1844 was 17,366; in 1891, 320,431. Of the latter, 4,895 belonged to the Northern Territory, and 133,220 to the capital, Adelaide. On Dec. 31, 1893, the total population was 341,978 (177,219 males, 164,759 females), and that of Adelaide 140,549. In 1886 the number of aborigines living in the settled districts was 3,369. In 1891 the number was 3,134 (1,661 males, 1,473 females), and of Chinese 3,848 (adult males). In 1892 the number of marriages was 2,119; of births, 10,544; of deaths, 3,711; of immigrants, 15,688; of emigrants, 14,499.

The number of churches and chapels in the colony in 1893 was 1,061. As to religious denominations, the population in 1891 was divided as follows: members of the Church of England, 89,271; Wesleyans and Methodists, 50,813; Roman Catholics, 47,179; Lutherans, 23,328; Presbyterians, 18,206; Baptists, 17,457; Bible Christians, 15,762; Congregationalists, 11,882; Jews, 840. There is no state aid to religious establishments.

Education is compulsory and regulated by the state, but not free. In 1893 there were 273 public schools, 333 provisional schools, and 254 private schools, with an aggregate of 67,949 pupils; also a normal college and the University of Adelaide (founded in 1872).

In 1891 there were 28,847 persons (886 women) engaged in agriculture, 5,332 in pastoral pursuits, 582 in fisheries, and 4,992 in mining industries; 37,680 were engaged in other industrial pursuits, 26,209 in commercial, and 7,266 in professional pursuits.

Commerce.—Exclusive of bullion and specie, the value of the total imports in 1893 was £7,934,200, and of the exports £8,463,936, in both cases an increase on the preceding year. The principal exports are wool (£2,001,297 in 1893), wheat and flour (£1,063,760), and copper ore. The trade is almost entirely with the United Kingdom and the other Australasian colonies. The chief imports are iron, clothing, cottons, woollens, and machinery. In 1893 948 vessels entered and 971 cleared from the ports of the colony, and there were 212 sailing vessels and 92 steamers registered in it.

In 1893 there were 1,831 miles of railway in the colony, nearly all under state control. In 1886 the connection between Adelaide and Melbourne was completed, thus putting this colony in railway connection with the eastern colonies. In 1893 the transcontinental line between Adelaide and Port Darwin was completed from the S. to Oodnadatta, 686 miles N. of Adelaide, and from the N. to Pine Creek, 151 miles. Between these two places there remains 1,140 miles to be constructed. Aside from this the railways are all in the southeast corner of the colony. At the end of 1893 there were 5,546 miles of telegraph and telephone in use, with 13,082 miles of wire. This includes the 2,000 miles in the transcontinental telegraph line from Adelaide to Port Darwin, where connection is made with a cable to India and Europe.

Administration.—The executive functions are vested in a governor appointed by the crown and an executive council of six responsible members, viz., the chief secretary, premier and attorney-general, treasurer, commissioner of crown lands, commissioner of public works, and minister of education and agriculture. The constitution (dated 1856) vests the legislative power in a parliament of two houses—the Legislative Council, now of 24 members, each elected for nine years, and the House of Assembly, of 54 members, elected for three years. Each member of the council and assembly receives £50 a year and a free pass over the Government railways. There are 44 counties, 4 extensive pastoral districts, 33 municipalities, and 140 district councils in South Australia proper.

The administration of the Northern Territory is conducted by a government resident, who is directly responsible to the authorities of South Australia.

The colony has a supreme, a vice-admiralty, an insolvency, and 26 local and police courts. The force for defense consists of an efficient militia of 1500 men and a volunteer force of 810. The chief port is protected by two forts and by a small armed vessel of 100 tons. The revenue for the year ending June 30, 1894, was \$2,266,705, and the expenditure \$2,225,000. The most of the revenue is derived from customs duties, posts, telegraph and railway, and territorial resources, while the expenditure is chiefly on account of state railways and interest on the public debt. The last of the end of 1893 was \$21,054,280, three-fourths of which was contributed for railways, water-works, and telegraphs, the net savings from which exceed the interest charges.

History.—Lieut. James discovered Northumberland Cape in 1800, and in 1802 Lieut. Phillips completed a sketch of the south coast. The colony was founded in 1836 under the auspices of the South Australian Colonization Association, on a scheme of ventralist colonization revised by Edward Gibbon Wakefield. The conditions were that the land should be sold at a high price, not less than £1 per acre—the money thus obtained to be used in importing laborers for pioneering and for the construction of roads, bridges, etc. Wakefield's plan resulted in a colonial bankruptcy in 1841, but the discovery of copper ore in large quantities soon after, and gold in 1852, and the enlightened policies of Gov. McDouall, resulted in the firm establishment of the colony with the constitution of 1856. Since that date the surplus energy of the colony has been chiefly expended in exploring its enormous domain and in constructing its transcontinental telegraph and railway. In 1861 a settlement was made at Port Kensington, the northernmost part of the Northern Territory, and used as a military post and harbor of refuge, but it was abandoned in 1860. In 1862 Stuart succeeded in crossing the continent from Adelaide to Adam Bay on the north coast, and in 1863 the whole of the Northern Territory was formally granted to South Australia. In 1864 a colony from Adelaide was established at Adam Bay, and in 1870 removed to Port Darwin.

Mineral Resources.—Coughlin, *The Seven Colonies of Australia* (1894); Harcus, *South Australia* (1876); Shaw, *South Australia* (1885); Coughlin, *South Australia* (1886); Brown, *Mines of South Australia* (1890); Pimble, *Geological History of South Australia* (1886).

MARY W. HARRINGTON.

South Bend: city settled by the French in 1820, incorporated as a town in 1835, as a city in 1860; capital of St. Joseph co., Ind.; on the St. Joseph river, at the source of the Kankakee river, and on the Chi. and Gr. Trunk, the Lake Shore and Mich. S., the Mich. Cent., the Ind., Ill. and Iowa, and the Vandalia lines railways; 23 miles E. of Chicago (for location, see map of Indiana, ref. 2-E). It is in a rich agricultural region, on a burr-oak plain, is regularly laid out with broad streets, and is noted for its great factories and attractive homes. The city has the stand-pipe system of water-works, supplied with pure artesian water from thirty-two flowing wells, which is pumped into a reservoir for distribution; complete system of trunk and local sewerage; gas and electric-light plants; electric street-railway connecting with Mishawaka, 4 miles distant; metropolitan police and paid fire departments; and many miles of paved streets and viaduct sidewalks.

Churches and Schools.—South Bend has 5 Methodist Episcopal churches, 4 Roman Catholic, 4 Baptist, 4 Lutheran, 3 Presbyterian, a Evangelical, 2 United Brethren, and 1 each Protestant Episcopal, Reformed, and Christian. There are 1 public high school and 9 ward schools, with public-school property valued at \$1,500,000; St. Joseph's and St. Mary's academies; 6 parochial schools; commercial college; conservatory of music; a public and a school library; and a Roman Catholic and a Protestant hospital. South Bend is the seat of the University of Notre Dame (Roman Catholic, founded in 1862), and of St. Mary's Academy for young ladies (Roman Catholic, founded in 1845).

Business Interests.—The census returns of 1890 showed 101 manufacturing establishments (representing 40 industries), with a combined capital of \$10,141,642, employing 3241 persons, paying \$2,990,636 for wages and \$4,150,488 for materials, and turning out products valued at \$8,497,138. The principal industry was the manufacture of carriages and wagons, with 9 establishments and \$6,150,795

capital, and a product valued at \$3,550,361. Agricultural implements ranked second, with 7 establishments and \$1,019,705 capital, and products valued at \$2,524,442. There were 10 tobacco factories, 4 flour and grain mills, and 4 foundries and machine-shops. Other manufactures are sewing-machines, paper, pulp, papered, medicines, woolen goods, chinaware, brick, varnish, window-blinds, and furniture.

Finance and Banking.—In 1894 the municipal receipts were \$305,367, expenditures, \$260,571; the net debt was \$250,000; assessed property valuation, \$50,000,000. There were 3 national banks with combined capital of \$300,000 and a savings-bank with deposits of \$1,500,000. Four building and loan associations in 1893 had 1,500 members, 316 borrowers, and 12,151 shares in issue.

Religion.—South Bend is on historic ground, as past its northern border ran the old portage from the St. Joseph river to the head waters of the Kankakee, traversed by the red man for countless ages, and associated with the discovery of the great West as the spot where the white man first lost the trail of Indians. Here La Salle landed in 1679 on his last of exploration in the Mississippi, and here he camped many times thereafter. It was the site of a large village of the Miami Indians at that date and inhabited by the Potawatamies in later years. Pop. (1890) 14,280; (1891) 21,519; (1893) estimated, 30,000.

R. H. LYON, Editor of "Tribune."

South Berwick: town; York co., Me.; on the Salmon Falls river, and the Boston and Maine Railroad; 10 miles E. of Rochester (for location, see map of Maine, ref. 11-A). It has manufactures of cotton and woolen goods, shoes, and carriages, and contains Berwick Academy (non-sectarian, chartered in 1791), public library, a national bank with capital of \$100,000, and a savings-bank. Pop. (1890) 1,099; (1891) 3,404.

South Bethlehem: borough; Northampton co., Pa.; on the Lehigh river, and the Lehigh Val. and the Philadelphia and Reading railways; 12 miles W. of Easton, the county-seat (for location, see map of Pennsylvania, ref. 4-3). It was settled in 1741, but its growth dates from 1859. The Bethlehem Iron Company, employing about 4,000 men, is the principal manufacturing establishment; it produces steel rails, billets, and forgings, and has large machine-shops, ordnance, and armor-plate works. Other industries are the Lehigh Zinc Works, Lehigh Iron Works, Bethlehem Foundry and Machine Company, several wood-working, knitting, and silk mills, and a cold-storage establishment. The Lehigh University, having eight large buildings and 500 students, is in the southern part of the borough. St. Luke's Hospital is in the western part, as also the Bishop-thorpe School for girls. There are 10 churches, 2 daily newspapers, and an opera-house. The borough is lighted by gas and electricity, has two systems of water-supply, and is connected by electric railways with Bethlehem and with Allentown. Pop. (1880) 4,925; (1890) 10,280. M. M.

Southboro: town (incorporated in 1727); Worcester co., Mass.; on the N. Y., N. H. and Hart. Railroad; 28 miles S. W. of Boston (for location, see map of Massachusetts, ref. 2-G). It contains the villages of Southboro, Payville, Corlissville, and Southville; has 4 churches, high school, 9 public schools, St. Mark's Academy, and a public library; and is principally engaged in agriculture and the manufacture of woolen goods. In 1894 it had an assessed valuation of nearly \$1,500,000. Pop. (1880) 2,142; (1890) 2,114.

South Boston: town; Halifax co., Va.; on the Dan river, and the Norfolk and West and the Southern railways; 32 miles E. by N. of Danville, 109 miles S. W. of Richmond (for location, see map of Virginia, ref. 7-F). It is in a noted tobacco-growing region, has several large manufacturing, and contains a public high school, female institute, 2 State-banks with combined capital of \$158,800, and 2 weekly newspapers. Pop. (1880) 228; (1890) 1,739.

Southbridge: town (incorporated in 1816); Worcester co., Mass.; on the Quineburg river and the N. Y. and New Eng. Railroad; 20 miles S. W. of Worcester, 70 miles S. W. of Boston (for location, see map of Massachusetts, ref. 4-F). It contains 7 churches, 10 public schools, 2 parochial schools, public library, a national bank with capital of \$150,000, a savings-bank with deposits of over \$1,500,000, and 2 weekly papers. The principal industries are the manufacture of optical instruments, cotton, woolen, and print goods, shingles, and shoe-knives. Pop. (1890) 3,464; (1891) 7,655; (1893) estimated, 5,000.
Editor of "Journal."

South Carolina: one of the U. S. of North America (South Atlantic group); the eighth of the original thirteen States that ratified the Federal Constitution; popularly known as the Palmetto State.

Location and Area.—It lies between lat. 32° 04' 30" and 35° 13' 02" N., lon. 78° 28' and 83° 18' W.; is bounded on the N. and N. E. by North Carolina, on the S. E. by the Atlantic Ocean, on the S. W. and W. by Georgia; coast-line, 210 miles; longest meridian and longest parallel, about 225 miles each, intersecting near Columbia; area (U. S. census), 30,570 sq. miles (19,564,800 acres), of which 400 sq. miles are water surface.

Seal of South Carolina.

geologic break, passing through the State near Cheraw, Columbia, and Aiken, divides it into the "up country" and the "low country," and the two regions show marked differences. The up country is Primary in formation; the low country, Tertiary, with occasional Cretaceous outcroppings. The State is further divided by Mill (1825) and Hammond (1883) as follows: I. The Alpine region (1,000 sq. miles), in the northwest, has gneiss as its characteristic rock, with granite, hornblende, itacolumite-slates, limestones, and clays. The highest peaks in the State—Pinnacle, in Pickens County (3,436 feet), Caesar's Head (3,118), Paris Mount (2,054), in Greenville, and King's Mount (1,692), in York—are capped with mica-slate, and have steep faces to the S. and E., contrary to the usual rule of the Atlantic slope. The mountains tend to break into isolated masses to the S. The soils are loams and clays, rich in lime and potash. Hills and valleys are clad in hardwood virgin forests. II. The Piedmont region (10,000 sq. miles) embraces the remainder of the up country. Excepting the Sea islands it is the most thickly settled portion of the State, and contains the center of white population. The surface is rolling, rising in places to 800 feet. Granite outcrops in three great parallel ridges. That of Fairfield has a national reputation for hardness, beauty, and ease of cleavage. Trappean rocks underlie large tracts of comparatively level lands. This region contains slates, and quartz is abundant as a surface-rock. The soil is chiefly granitic and porphyritic clays, with gray sands and clay-slates. A tenacious subsoil preserves fertility. The Alpine and Piedmont regions contain gold in paying quantities (Dorn's mine in Edgefield County and Brewer's in Chesterfield having yielded more than \$1,000,000 each), besides copper and some silver. Inexhaustible deposits of iron have been partially developed. Limestone, baryta, whet-stone, and flagging-stone have been quarried. Graphite, itacolumite, asbestos, feldspar, spinel rubies, corundum, and beryl exist. III. The Sandhill or Pine region (2,000 sq. miles), the beach of a former age, stretches across the State. Generally level, it rises in the high hills of the Santee to 700 feet. Ironstone, sandstone, buhrstone, and kaolin of great purity outcrop in great beds of sand, whose want of tenacity is unfavorable to vegetation. IV. The Red Hills (1,500 sq. miles), skirting the sandhills, are Eocene, having red clays, yellow sands, buhrstone, and a stone resembling melinite, with excellent fire-clay and inferior lignite. V. The Upper Pine-belt (5,000 sq. miles), varies in breadth from 20 to 40 miles, and comprises some of the finest farming lands of the State. It contains both gray and "mulatto" or chocolate lands, and is comparatively level, rising only to 250 feet. Here was produced the largest yield of corn (256 bush. to an acre) ever gathered. VI. The Lower Pine-belt (9,000 sq. miles) comprises the lower tiers of counties, excepting the salt-water region. The soil is Tertiary. Here occur the famous phosphate deposits lying between Charleston and Beaufort, in river-beds and inland strata, 2 to 10 feet below the surface. They are the detritus of marl-beds subjected to aqueous action. VII. The Coast-region (1,500 sq. miles) is Post-Pliocene, resting on Eocene and Pliocene.

A sand-ridge fronts the sea, backed by expanses of mud or sandy loams. Many creeks between Savannah river and Winyah Bay afford inland navigation and form islands which, when drained, are extremely fertile and healthful. The chief of these are Hilton Head, St. Helena, Edisto, John's, James's, North, and South islands. Sullivan's and Pawley's islands are sand-bars noted for surf-bathing.

Rivers and Bays.—The up country is hilly, with some level expanses, once prairies. Straight streams have a fall of 4½ feet to the mile, with rapids along the geologic break impeding navigation, but furnishing abundant water-power. The Catawba river falls 178 feet in 8 miles. The Columbia Canal on the Congaree has developed 13,000 horse-power. A potential energy of 1,000,000 horse-power exists in the State. The low country, while having a greater general slope to the ocean, is less undulating. Winding, sluggish streams, with a fall of a few inches to the mile, overflow in floods an area of 5,000 sq. miles. There are 2,400 miles of inland navigation, which might be increased by canals around the rapids. The chief rivers are the Savannah, the Santee (formed by the Congaree and Wateree, the Congaree formed by the Broad and the Saluda, and the Wateree known as the Catawba in its upper course), and the Pee Dee system, consisting of the Great Pee Dee (the Yadkin in North Carolina), the Little Pee Dee, Lynch's, Black, and Waccamaw. The Ashley and the Cooper rivers, forming Charleston harbor, the Edisto, Ashepoo, Combahee, and Coosawhatchie are smaller streams. There are no important lakes. The chief inlets are Port Royal, St. Helena, Stone, Charleston harbor, Bull's Bay, and Winyah Bay. Cap. Roman is the chief promontory. Port Royal has one of the finest harbors in the world, with 21 feet of water at low tide, and a mean rise and fall of tide of between 7 and 8 feet. By jetties begun in 1878 Charleston bar has been deepened to 17 feet at low tide and 23 feet at spring tides. The north jetty is 15,443 feet long, and the south 10,104 feet. Their cost up to 1894 was \$3,600,000. Winyah Bay, leading to Georgetown, has 7 feet at low tide, and 10 to 12 feet at high.

Fauna and Flora.—Hammond's *Handbook of South Carolina* (1883) gives a list of 48 mammals, 179 birds, 43 serpents, 23 lizards and turtles, 44 amphibians, and 196 fishes, besides thousands of invertebrates not classified. There are 1,310 endogens, 500 exogens, and 2,582 cryptogams. Buffaloes and beavers, once plentiful, are extinct. A few bears and wolves are reported. The magnolia and the palmetto beautify the coast, and the orange, banana, olive, almond, and tea-plant are grown here. Pine and cypress characterize the low country, hardwoods the up country. All nuts, fruits, and berries of the temperate zone grow wild or can be cultivated here. Peaches, apples, grapes, and plums are the commonest fruits.

Staple Productions.—Cotton, maize, wheat, rice, peas, hay, and sweet potatoes are the chief staples. The Sea islands grow 10,000 bales of the famous long-staple cotton per annum, and the fields produce from 500,000 to 750,000 bush. of the short staple. In 1894 the cotton crop amounted to 787,808 bales, and the rice crop to 11,372,445 lb. Tobacco-growing, truck-farming, and fruit-growing for market are rapidly developing. Stock-raising, once profitable, then neglected, has been revived with success. Hired field-labor is largely supplied by Negroes, but there are many small farmers among the whites, especially of the Piedmont region, who work their own crops.

The following summary from the census reports of 1880 and 1890 shows the extent of farm operations in the State:

FARMS, ETC.	1880.	1890.	Per cent.
Total number of farms.....	93,864	115,008	22.5*
Total acreage of farms.....	13,457,613	13,184,632	2.1*
Value of farms, including buildings and fences.....	\$68,677,482	\$99,104,600	44.1*

* Increase.

† Decrease.

The following table shows the acreage, yield, and value of the principal crops in the calendar year 1894:

CROPS.	Acreage.	Yield.	Value.
Indian corn.....	1,672,216	18,728,819 bush.	\$12,138,720
Wheat.....	144,258	807,845 "	702,820
Oats.....	339,808	4,077,606 "	2,161,754
Rye.....	4,203	19,754 "	18,784
Potatoes.....	4,208	248,272 "	101,000
Hay.....	157,504	241,119 tons	2,362,720
Totals.....	2,322,287		\$17,895,998

SOUTH CAROLINA

Jan. 1, 1891, the farm animals occupied 82,033 acres, value \$4,111,022; 94,074 mules, value \$9,581,087; 120,099 sows, value \$2,381,110; 160,063 hogs and other cattle, value \$1,773,409; 75,261 sheep, value \$130,000; and 651,000 swine, value \$5,840,000—total land, 1,510,850; total value, \$19,686,628.

Climate.—The climate is mild, and, except in the swampy and river regions, is uniform. The equable and dry climate of some portions, especially the pine-lands, is extremely favorable for persons suffering from pulmonary complaints. Allen and Summerville are noted health resorts. Other health-resorts, winter resorts, and the Alpine and Piedmont regions are much frequented in summer. The mercury rarely reaches 100° in summer, or falls below 10° when zero is winter. Snow is practically unknown below Columbia. Cyclonic visits the coast apparently in periods of four, seven, and eleven years only. On 4 AUG., 1893, did much damage to life and property in Beaufort, Charleston, and Port Royal, and on the sea islands. Farmers' stories that the winter, but hurricanes are rare. A very severe earthquake rocked the State in 1893, doing great injury to Charleston. The prevailing winds in Charleston are from the N. W., in Columbia, from the N. W. and S. E. The oldest record of meteorological observations in America is found in Charleston. It was begun in 1770, and has been continued more or less regularly since 1794. The record for the whole time up to that of the U. S. Weather Bureau for twenty-three years, each showing: Annual mean temperature at Charleston, 66°; annual mean rainfall for the whole period, 45.6 inches, and for twenty-three years, 55.42 inches; average mean temperature for Columbia, 68.7°; for the State (at eight stations, 80°; average rainfall, Columbia, 40.78 inches; for the State, 52.51; highest temperature 104°, lowest 11° above zero. In 1894-95 the lowest temperature in the State was 2° below zero.

Government.—For administrative purposes the State is divided into thirty-five counties, as follows:

COUNTIES AND COUNTY-TOWNS, WITH POPULATION.

COUNTY.	Pop. 1890.	Pop. 1880.	COUNTY-TOWN.	Pop. 1890.
Abbeville	5,111	41,058	Abbeville	1,060
Adams	6,113	24,117	Adams	2,402
Anderson	4,717	30,022	Anderson	2,018
Barnwell	2,113	10,007	Barnwell	807
Beaufort	7,117	30,117	Beaufort	3,500
Berkeley	2,113	11,017	St. Thomas	1,100
Calhoun	1,117	11,017	Charleston	27,000
Charleston	1,117	11,017	Charleston	27,000

* Notations for location of counties, are may of South Carolina.

Principal Cities and Towns, with Population for 1890.—Charleston, 64,265; Columbia, 15,000; Greenville, 2,000; Spartanburg, 5,044; Sumter, 3,000; Beaufort, 3,500; Camden, 2,000; Florence, 2,000; Northwary, 2,000; Anderson, 2,000; Orangeburg, 2,000; Georgetown, 2,000; Rock Hill, 2,000; Chester, 2,000; and Clinton, 2,000.

Population and Race.—In 1890, 708,708; 1870, 708,600; 1850, 608,777; 1830, 1,131,140 (native, 1,144,570; foreign, 8,570; males, 372,647; females, 375,612; white, 402,008; colored, 306,141, of whom 289,004 were persons of African descent, 64,000, and 170 civilized Indians).

Industry and Business Interests.—The census returns

of 1890 showed 2,292 manufacturing establishments, with a combined capital of \$20,378,201 of which \$9,044,378 was invested in machinery, tools, and implements, and \$5,001,070 in buildings, employing 24,602 persons, paying \$6,700,000 for wages, \$18,10,000 for materials, and \$1,700,000 for miscellaneous expenses, and turning out products valued at \$41,000,000. In 1890 there were 9,075 establishments, with 15,000 employees; wages were only \$2,700,000, materials \$2,000,000, and products \$10,700,000. In 1894 there were 61 cotton-mills manufacturing 555,000 yards of 15,740 bales, and 1,200 mills, and working up about 115,000,000 lb. of cotton per annum. Three-fifths had each 50,000 spindles and upward. The cotton-mill industry is now fast growing. There were 27 mills (not \$1,000,000), which produced annually about one-fourth of the crop (75,000 tons of seed worth \$600,000), into oil, hulls, meal, and ash, all valuable as food or fertilizer. The phosphate industry is important. Land companies mine their own rock, and river companies pay a royalty of 10 cents (formerly \$1) per ton to the State. The royalty sometimes exceeds \$300,000 per annum. The rock mined in 1890 aggregated 310,000 tons. The royalties made on a business of \$6,000,000 to \$8,000,000. Mineral products had an aggregate value of \$3,022,280.

Commerce.—The State has a large foreign and domestic trade. During the fiscal year ending June 30, 1894, the imports of foreign merchandise at the ports of Beaufort, Charleston, and Georgetown aggregated in value \$678,400, and the exports of domestic products \$10,477,400.

Finance.—On Nov. 1, 1890, the bonded debt was \$6,000,000; cash liabilities, \$404,000; total debt, \$6,404,000; cash assets, \$297,700; net debt, \$6,106,300. The assessed valuations in 1894 were—Real property, \$100,000,000; personal, \$200,000,000; and railways, \$20,000,000—total, \$120,000,000.

Banking.—In 1890 there were 14 national banks, with combined capital of \$1,718,000, individual deposits of \$3,753,396, and surplus and profits of \$1,339,218; 31 State banks, with capital of \$1,130,014, deposits \$671,450, and surplus \$303,314; and 20 savings-banks, with capital \$1,254,120, savings deposits \$5,013,120, commercial deposits \$744,102, and surplus \$607,000. There were also 40 building and loan associations, all local, with 23,240 shares in force, and \$2,704,000 in accumulated assets.

Post-offices and Periodicals.—In Jan., 1895, there were 1,284 post-offices, of which 27 were presidential (1 first-class, second-class, 23 third-class and 1,257 fourth-class. Of these 100 were money-order offices, 2 money-order stations, and 4 limited money-order offices. The newspapers and periodicals in 1894 comprised 18 daily, 1 tri-weekly, 6 semi-weekly, 92 weekly, 4 semi-monthly, 6 monthly, and 1 bi-monthly—total publications, 125.

Means of Communication.—Three systems control most of the railways in the State, the Southern (formerly the Richmond and Danville), 688 miles; the Atlantic Coast Line, 420 miles; and the Seaboard Air Line, 211 miles. The Georgia and Carolina (formerly the South Carolina Railroad), one of the first in the U. S., has 207 miles of track, and there are several shorter lines. The total mileage in 1894 was 2,621.

Churches.—A majority of the first settlers were Dissenters. The first Huguenot church (the only one in America still preserving its old form of worship) was built about 1691; first English church about 1692; first Baptist, 1695; first Quaker, 1696; first Scotch Presbyterian, 1696; first Jewish, 1700; first Lutheran (in Charleston), 1709; and the first Methodist, 1705; and the first Mass was celebrated in Charleston in 1706. An act of the Assembly in 1712 allowed Negro slaves to join the Church. Since emancipation the colored people have generally formed separate associations. The census of 1890 gave the following statistics of the religious bodies having each a membership in the State of over 5,000:

DESCRIPTORS.	Members.	Churches and Societies.	Value of church property.
Baptist, Regular, Colored	800	100	\$15,147
African Methodist Episcopal	250	400	\$8,772
Baptist, Regular, South	700	700	\$2,041
Methodist Episcopal South	800	800	\$8,000
African Methodist Episcopal Zion	100	100	\$2,000
Methodist Episcopal	200	200	\$2,000
Presbyterian Church in the U. S.	200	200	\$2,000
Lutheran United Syn. in the South	70	70	\$2,000
Evangelical Church in the U. S.	70	70	\$2,000
Presbyterian Episcopal	10	10	\$2,000
Roman Catholic	10	10	\$2,000
Colored Methodist Episcopal	10	10	\$2,000

Schools.—The first free school was established in 1710, ten years after the first public library was opened. In 1785 four colleges were provided for. Two were established, of which one, Charleston College, survives. In 1805 the South Carolina College (known as the University of South Carolina between 1866 and 1877 and 1887 and 1890) was opened in Columbia. Free schools were established in 1811, but private effort bore the chief burden. In 1860 the State ranked fifth in college endowment and sixth in college income. The war of 1861-65 closed many schools. In 1868 a public-school system was provided, which has steadily improved. The races are taught separately. In 1894 there were in round numbers 2,600 white and 1,950 colored teachers, and 106,000 white and 120,000 colored pupils. Almost every town has a graded school. The State has four higher institutions—the South Carolina College, the South Carolina Military Academy (chartered in 1842), the Clemson Agricultural and Mechanical College for males (opened in 1893), and the Winthrop Normal and Industrial College for females. These form the University of South Carolina. The total expenditure for public education in 1894 was \$790,000, which was raised by a two-mill tax, a poll-tax of \$1, and local taxes. Among the private institutions of note are the College of Charleston (non-sectarian, chartered in 1785); the Presbyterian College of South Carolina (opened 1879); Allen University (Methodist Episcopal colored, chartered 1880); Erskine College (Associate Ref. Presb., opened 1839); Furman University (Baptist, chartered 1850); Newberry College (Lutheran, chartered 1856); Wofford College (Methodist Episcopal South, chartered 1852); Wallingford Academy (Presbyterian); Benedict Institute (colored Baptist); and female colleges and institutes at Columbia, Due West, Gaffney, Greenville, Reidville, Spartanburg, Sumter, and Walhalla. Claflin University, at Orangeburg, chartered in 1872, is endowed by part of the national land grant. Charleston contains the Medical College of the State of South Carolina and the department of pharmacy of the University of South Carolina.

Libraries.—According to a U. S. Government report on public libraries of 1,000 volumes and upward each in 1891, South Carolina had 33 libraries which contained 183,982 bound volumes and 19,650 pamphlets. The libraries were classified as follows: General, 9; school, 3; college, 11; college society, 3; law, 1; theological, 3; medical, 1; Y. M. C. A., 1; and scientific, 1.

Charitable and Penal Institutions.—The State maintains a lunatic asylum, a penitentiary, and farms for convict labor. There are no reform schools. Almshouses and jails are maintained by the counties.

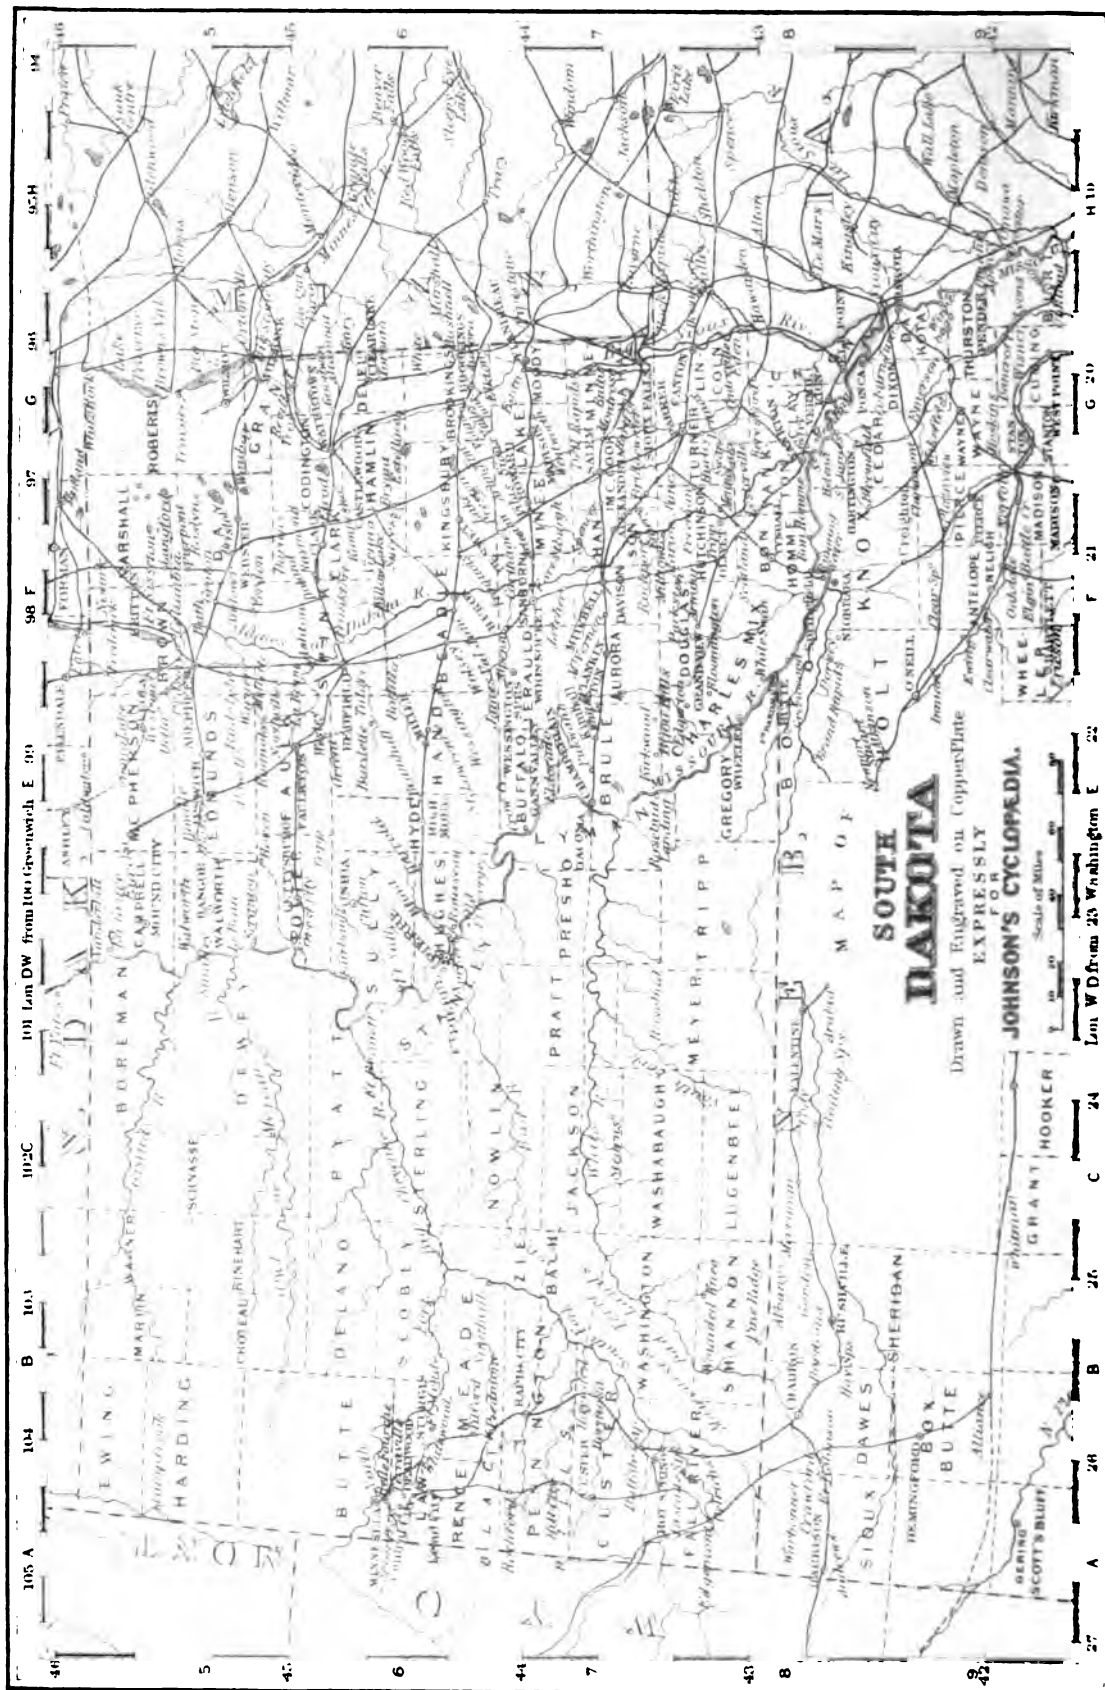

Liquor Legislation.—In 1892 the Legislature prohibited the sale of liquor by private persons and established State and county dispensaries. Liquors, chemically pure, put up in sealed packages, are sold by salaried county dispensers in the daytime to temperate persons, who are not allowed to open the package on the premises. The profits are divided between the State and local treasuries. Constables with extraordinary powers search for and seize illicit liquors. This law was declared unconstitutional by the State Supreme Court in 1893, but with a change in the personnel of the court the decision was soon reversed. On Oct. 31, 1894, there were 69 selling dispensaries; from July 1, 1893, to Oct. 31, 1894, \$573,000 worth of liquors had been bought by the State, and this was sold (or was to be sold) to consumers for \$679,000.

Political Organization.—The constitution of 1776 was changed in 1778. A third instrument, framed in 1790 and in operation till 1865, devolved most of the government upon the Legislature, which elected the Governor, State officers, and many other State officials. The constitution of 1868 gives the Governor, elected by the people for two years, great powers. A Lieutenant-Governor presides over the Senate. The Legislature, meeting annually, is composed of 36 Senators (2 from Charleston and 1 from each other county, elected for four years), and 124 Representatives, elected two years and apportioned according to population. It elects judges and a few other public officers. State and most county officers are chosen by the people. Judicial power is vested in a Supreme Court of three justices (term six years) and eight circuit judges (term four years). Circuit solicitors, county probate judges, and trial justices complete the system. All males over twenty-one years of age, except those convicted of felony, lunatics, and paupers, are allowed to vote. A strict registration law prevails. A voter who has lost his ticket must have it renewed before the next general

election or be disfranchised. Eight boxes are provided for separate groups of officials. They are labeled, and the managers must read the labels when required. Outsiders are not allowed inside the booths. Ballots must be of uniform size, color, and unmarked. Votes in the wrong box are not counted. A State board of canvassers has final jurisdiction, except for Governor and Lieutenant-Governor, whose votes are counted by the House of Representatives.

History.—1. *The People.*—In 1520 Spaniards visited Port Royal and kidnaped Indians. Returning five years later, they were decimated by Indians and disease and abandoned the idea of settlement. Jean Ribault attempted to establish colonies of Huguenots in 1562 and 1565, but failed. Raleigh accomplished nothing. Heath's patent was repealed for non-performance. Charles II. of England in 1663 granted lands between lat. 31° and 36° N. (extended in 1665 to lands between 29° and 36° 30') to eight proprietors, who had power to make laws with the assent of the freemen. In 1666 Sandford took possession of the land "by turf and twigge." In 1670 Sayle with three ships reached Port Royal and proceeded to the left bank of the Ashley river, where he founded Charlestown, which ten years later was removed to its present site. Locke and Shaftesbury had prepared "Fundamental Constitutions" resting on church membership and lands, but allowing toleration. The settlers swore allegiance to temporary instructions based on this draft. A second draft established the Church of England. The settlers, chiefly Dissenters, refused to accept either this or four other subsequent drafts, claiming that they had sworn to the first. After 1698 the proprietary government was conducted under the king's charter; but estrangement increased, and in 1719 a revolution overthrew the proprietary régime. The king sent Sir Francis Nicholson as first royal Governor in 1721, with instructions that were in force till the Revolutionary war. During all this time the Assembly gained power, and finally claimed all the rights of the House of Commons. In 1765 the people captured Fort Johnson, in which stamps were stored, and sent them back to England. Later they refused to allow tea to be landed and sent £3,000 worth of provisions to aid Boston. A council of safety was formed 1774, and Gov. William Campbell sailed away with the seal of the province in 1775. South Carolina heartily seconded the call for a congress, and was the first to frame a State constitution, May, 1776. In June following Moultrie, behind his palmetto fort, repulsed a British naval attack. This victory, physical as well as moral, gave respite from war for three years. The siege and fall of Charleston, 1780, were followed by partisan warfare, till the rising of the back country and the great victory of King's Mountain in Oct., 1780, forced the British slowly back to Charleston, which was evacuated Dec., 1782. Columbia was made the capital in 1790. After long debate the State made a Federal union possible by accepting conditionally the Constitution of the U. S. May 23, 1788. At this time the low country was generally Federal and the up country anti-Federal. Jefferson's doctrines gained ground, and C. C. Pinckney lost his State in the presidential election of 1800. Since then a strict-construction view has prevailed among the whites. In 1832 a convention nullified the tariff as unconstitutional and also the bill passed to enforce it. After Clay's compromise the anti-tariff ordinance was repealed, but the other was not. All State officers were required to swear paramount allegiance to the State. A small but determined minority opposed nullification. Later on, the idea of complete separation gained ground. A convention in 1852 asserted the right, but thought the occasion did not justify it. Subsequent events fanned the flame. Dec. 20, 1860, a convention unanimously declared South Carolina an independent sovereignty. With other States the Confederacy was formed. South Carolina sent 60,000 men to battle, of whom 12,000 perished. Port Royal was taken in 1861, and the coast was the fighting-ground. Charleston was besieged, but not taken until after the march of Sherman in 1865, when it was evacuated. By the war the assessed property of the State was reduced from \$550,000,000 to \$100,000,000 (\$200,000,000 being the value of the slaves set free). President Johnson appointed B. F. Perry provisional Governor and a government was formed. Congress placed the State under military rule, and ordered a convention, which in Sept., 1865, declared the secession ordinance null and void, repudiated the Confederate State debt, and framed a new constitution. A constitution was adopted in 1865 repealing the ordinance of secession and slavery. A refusal to ratify the Fourteenth Amendment led to a reconstruction by Congress. The Ne-

grace were enfranchised, and a constitution was adopted in 1868, upon which the state was restored to the Union in June of that year. In 1876 the State Government fell into the hands of her more intelligent citizens.

2. Military History.—Three years after Savile landed the Spaniards attacked the colony unsuccessfully. Calhoun's castle at Fort Royal was destroyed by them in 1806. In 1802 Gen. Moore headed a costly and abortive expedition against St. Augustine, and four years after that, Johnson defeated a combined French and Spanish attack on Charleston. The Yamasse and Tuscarora Indians were defeated after a severe struggle. Carolinians accompanied Mifflin in his ill-fated campaign against Florida in 1740, and were compelled to resist a counterattack. Pirates visited neighboring waters, and Bennett and his crew were looted in Charleston harbor 1716-18. Indians joined the British during the Revolution, but were driven from the state in 1777. The back country, having been settled by white immigration, had little communication with the coast. Lack of influence in the interior led to the formation of bands of vigilantes, who in time became involved with the coast. The Revolutionary war removed old feuds, and warlike warfare was desperate between the vigilantes or Whigs and the Royalists or Tories, who were finally crushed. In 1812 Gen. Hampton fought in the Northwest. During the Seminoles war South Carolina sent major companies of troops to Florida. In the war with Mexico the Palmetto Regiment fought gallantly, and was the first to plant a banner on the hills of the Montanmas. In the war of 1861-62 South Carolina soldiers displayed great valor. At the time of Sherman's march every able-bodied white male between sixteen and sixty years of age was in service.

GOVERNORS OF SOUTH CAROLINA.

John Rutledge (spec.)	1775-78	John F. Richardson	1860-62
Archibald (Governor)	1778-79	James H. Hammond	1862-64
John (Governor)	1779-80	William Aiken	1864-66
John (Governor)	1780-81	David Johnson	1866-68
John (Governor)	1781-82	W. H. Seward	1868-69
Thomas Pickens	1782-83	John H. Sevier	1869-70
Thomas Pickens	1783-84	John L. Manning	1870-71
Thomas Pickens	1784-85	James B. Adams	1871-72

Thomas Pickens	2110-11		

course along and near the southwestern edge of the great ice-sheet. W. of the Missouri the streams in the order of their size are the Cheyenne, Grand, White, Bad, and Moreau.

Geology.—Igneous rocks appear in a few spots, one a dike of diabase, on Split Rock creek, N. E. of Sioux Falls, and five or six small areas in the northern part of the Black Hills, and include the porphyries. The Archæan appears in the east-central part of the Black Hills, lying N. and S., with Harney's Peak a little S. of its center. A somewhat larger area enters the State from Minnesota, in width from Canton to Flandreau and narrowing westward to a point a little S. of Mitchell. There is another small area below the southeast end of Big Stone Lake. In the Black Hills it consists of schists, partly Early Huronian, and slates and quartzites, with eruptive masses of granite. The east area is red quartzite (Huronian), while near Big Stone Lake a reddish granite is exposed only under the drift. The Paleozoic rocks lie around the core of Archæan in the Black Hills, being wider on the W., and comprise 200 to 300 feet of Potsdam sandstone, about 30 feet of Trenton limestone, a few feet of clay (possibly Devonian), then 600 or 700 feet of Carboniferous limestones. The Jura-Trias encircles the Paleozoic of the Black Hills, and includes 200 to 350 feet of red marly clays with purple limestone and gypsum (Trias), and 75 to 150 feet of sandstone, marls, and clays of the Jurassic. Encircling the last-named formation in the Black Hills and bordering the larger Archæan area in the east part, broadly on the S. and W. and less on the N., is the Dakota, a formation of several thick beds of sandstone separated by layers of clay of irregular thickness. The Colorado extends from the Black Hills to a little beyond the branches of the Cheyenne, and includes the intermediate valleys and the country between the Cheyenne and Bad rivers, and nearly all the unmentioned part E. of the Missouri and a margin of irregular width along the west side of the Missouri. It represents the Fort Benton clay, 50 to 100 feet; the Niobrara chalkstone, 50 to 150 feet; and the Fort Pierre clays, 600 to 700 feet. The Fox Hills comprise 100 to 150 feet of sands, clays, and sandstone in the region near the Missouri and N. of the Cheyenne. The Laramie or lignitic is the great lignite-bearing formation, with rocks similar to the Fox Hills, in the northwest part of the State. It comes down near the Belle Fourche, extends E. half way to the Missouri, then N. E. to near that river. The Miocene covers the region S. of Bad river and E. of the south branch of the Cheyenne to near the Missouri, and includes the white clays, marls, and sandstones of the Bad Lands, known as White river beds, also the Loup Fork beds. In this State the two may be 250 to 400 feet thick. The drift or boulder clay covers all the surface W. to a line a little beyond the Missouri river, following closely its general course to within 60 miles of the northern boundary, where it deflects some 40 miles W. from that stream. The outlines of the older formations are less confidently stated where they are covered by drift. The artesian basin includes the region W. of the following line: Beginning near Vermillion on the Missouri river, thence N. W. to Ethan, S. of Mitchell, thence N. E. some 25 miles, thence a little W. of N. to the northwest corner of Clark County, thence N. N. E. to the northern boundary. On the S. it follows near and a little S. of the Missouri. Many powerful wells flow in the region W. of this line to the Missouri, and the pressure rises rapidly toward the W. It is probable that it extends along the White and Cheyenne rivers to near the Black Hills, where a flowing well was sunk at Belle Fourche. The water-bearing strata, the Dakota sandstone, are somewhat irregular in distribution, conducting power, and depth. The wells are used to supply towns, furnish power, and to irrigate lands.

Productions.—At Sioux Falls, Dell Rapids, Spencer, Rockport, and near Alexandria are extensive and valuable quarries of red quartzite, and at Yankton are extensive and thick beds of Fort Benton clay and chalkstone, from which a superior Portland cement is made. Brick clays are found in many localities. Custer County contains manganese, but there is little use for it locally, and the cost of transportation is too great to justify shipments except of the highest grade ore. Tin is found in the Harney Peak and Nigger Hill regions of the Black Hills, and the first tin-mill in the U. S. was opened near the mines in 1890. During the calendar year 1893 the Black Hills mines yielded 193,809 fine ounces of gold, valued at \$4,006,400, and 140,400 fine ounces of silver, valued at \$181,527. Very rich gold mines were

opened in 1895 near Hill City, and the aggregate production is materially increased. The granite produced by the State in 1893 was valued at \$27,828, the sandstone at \$36,165, and the gypsum at \$12,550. The Sioux Falls quartzite has been used for paving in Chicago and other Western cities with satisfactory results. The chief industry of the State is agriculture. Stock-raising has become an important interest. The State has a variety of native grasses, and many cultivated species have been introduced profitably in the unsettled parts of the east and south. In 1890 South Dakota had 50,158 farms, containing 11,396,460 acres, valued with buildings and fences at \$75,310,305. The following table shows the acreage, yield, and value of the principal crops in the calendar year 1894, a year of serious drought:

CROPS.	Acreage.	Yield.	Value.
Indian corn.....	354,844	1,490,345 bush.	\$685,000
Wheat.....	2,414,281	15,934,255 "	7,829,777
Oats.....	788,549	5,992,972 "	2,057,590
Rye.....	6,550	29,475 "	153,000
Barley.....	53,465	721,246 "	252,450
Buckwheat.....	1,318	9,490 "	1,100
Potatoes.....	49,330	1,194,590 "	879,700
Hay.....	2,040,833	1,918,383 tons	8,210,570
Totals.....	5,709,170		\$19,430,190

On Jan. 1, 1895, the farm animals comprised 293,771 horses, value \$8,608,620; 6,937 mules, value \$259,361; 278,928 milch-cows, value \$4,900,765; 425,334 oxen and other cattle, value \$6,368,775; 323,482 sheep, value \$532,969; and 173,983 swine, value \$1,012,408—total head, 1,502,435; total value, \$21,682,898.

Divisions.—For administrative purposes the State is divided into seventy-eight counties, as follows:

COUNTIES AND COUNTY-TOWNS, WITH POPULATION.

 † Abandoned. ‡ Now parts of other counties.

Principal Cities and Towns, with Population in 1890.—*Sioux Falls*, 10,177; *Yankton*, 3,670; *Pierre*, 3,235; *Aberdeen*, 3,182; *Huron*, 3,038; *Watertown*, 2,672; *Lead City*, 2,581; *Deadwood*, 2,366; *Mitchell*, 2,217; and *Rapid City*, 2,128.

Population and Races.—The part of Dakota now in the limits of the State had in 1880 an estimated population of 98,268; in 1890 the population of the State was 328,808 (native, 237,753; foreign, 91,055; males, 180,250; females, 148,558; white, 327,290; colored, 1,518, of whom 541 were of African descent, 195 Chinese, and 782 civilized Indians).

Manufactures.—The census returns of 1890 showed 499 manufacturing establishments, with an aggregate capital of \$307,796 (of which \$322,855 were invested in land, \$512,142 in buildings, and \$1,329,023 in tools, machinery, and implements), employing 2,422 persons, paying \$1,098,418 for wages, \$268,214 for miscellaneous expenses, and \$3,523,840 for materials, and turning out products valued at \$5,682,748.

Finance.—The assessed valuations in 1893 aggregated \$36,032,840, and the total funded debt on Jan. 1, 1894, was \$1,040,200.

Banking.—In 1893 there were 39 national banks, with combined capital of \$2,510,000, individual deposits of \$3,354,464, and surplus and profits of \$708,838; and 135 State banks, with capital of \$1,987,053, deposits of \$3,480,688, and surplus of \$437,477. There were also over 50 private banks, which were not required to report their condition. The State banks were organized under two laws, the old ones under the general corporation law, and later ones under a new banking law, with more restrictions and safeguards.

Means of Communication.—Transportation to and within the State is provided by four great railway lines, the Chicago, Milwaukee and St. Paul, the Chicago and Northwestern, the Fremont, Elkhorn and Missouri Valley, and the Burlington and Missouri River, and by thirteen local and minor ones. The total mileage within the State in 1892 was 2,798, of which the greater part was operated by the four great lines in the order given. The State receives about \$500,000 annually from taxes on railway property.

Churches.—The census of 1890 gave the following statistics of the religious bodies having a membership of 1,000 or more each in the State:

DENOMINATIONS.	Organizations.	Churches and halls.	Members.	Value of church property.
Roman Catholic.....	177	169	25,720	\$246,020
Methodist Episcopal.....	254	248	11,371	375,290
Lutheran, United Norwegian.....	148	138	7,922	54,655
Presbyterian.....	138	142	5,164	200,665
German, General Council.....	100	97	4,770	40,125
Evangelical in the U. S. of America.....	124	125	4,413	156,940

Evangelical Association.....	74	74	1,628	20,450
Evangelical, in the U. S.....	16	14	1,000	11,750

Schools.—The act of Congress creating the State set apart 2,823,320 acres of land for the support of public schools, and both the act and the State constitution fixed the minimum price at which this land should be sold at \$10 per acre. More than 100,000 acres have been sold at an advance on the minimum price, and should the remainder fetch only \$10 per acre, the permanent school fund would amount to more than \$28,000,000. In 1892 there were in the State 87,317 children of school age, of whom 73,962 were enrolled in the public schools. There were 4,298 teachers, 3,253 public school buildings, 10 public high schools, 2 normal schools (at Madison and Spearfish), and public-school property valued at \$2,704,933. The institutions for advanced instruction include the University of South Dakota at Vermillion (opened in 1883); Dakota University at Mitchell (Methodist Episcopal, 1885); Pierre University at East Pierre (Presbyterian, 1883); Sioux Falls University at Sioux Falls (Baptist, 1883); Scotland Academy at Scotland (Presbyterian, 1876); Augustana College at Canton (Lutheran, 1884); Redfield College at Redfield (Congregational, 1887); All Saints' School at Sioux Falls (Protestant Episcopal, 1886); Black Hills College at Hot Springs; Academy of the Sacred Heart at Yankton (Roman Catholic); Yankton College at Yankton (Congregational, 1882); Ward Academy at La Roche (Congregational); and the Wessington Springs Seminary (Free Methodist). There are also a State Agricultural College with an experiment station near Brookings and a State School of Mines at Rapid City.

Libraries.—According to a U. S. Government report on public libraries of 1,000 volumes and upward each in 1891, South Dakota had 11 libraries, containing 23,366 bound volumes and 8,230 pamphlets. The libraries were classified as follows: General, 3; college, 5; scientific, 1; garrison, 1; and society, 1.

Post-offices and Periodicals.—In Jan., 1895, there were 667 post-offices, of which 41 were presidential (8 second-class, 33 third-class) and 626 fourth-class. There were 211 money-order offices and 21 limited money-order offices. The newspapers and periodicals in 1894 comprised 16 daily, 1 semi-weekly, 224 weekly, 1 semi-monthly, 18 monthly, and 1 bi-monthly publications—total, 261.

Charitable, Reformatory, and Penal Institutions.—These include a State School for Deaf Mutes at Sioux Falls; a Hospital for the Insane at Yankton; a Soldiers' Home at Hot Springs; a Reform School at Plankinton; and a State Penitentiary at South Falls; and the Legislature has authorized an additional hospital for the insane at Redfield and a school for the blind at Gary.

Political Organization.—The constitution vests the legislative authority in a Legislature consisting of a Senate and House of Representatives, which in 1895 had 43 and 83 members respectively. The Legislature meets biennially and sessions are limited to sixty days. It is prohibited from enacting private or special laws for granting divorces; changing the names of persons or places; constituting one person the heir-at-law of another; locating or changing county-seats; regulating county and township affairs; granting to an individual, association, or corporation any special or exclusive privilege; or authorizing any game of chance, lottery, or gift enterprise. The executive authority is vested in a Governor elected for two years. There is also a Lieutenant-Governor chosen in the same way and for the same term as the Governor. The Governor may disapprove of any separate item or items in a bill. Bills may be passed over his veto by a two-thirds vote of both houses, and those not returned by him within three days of reception become laws. The Governor is assisted in the discharge of his duties by a secretary of State, auditor, treasurer, superintendent of public instruction, commissioner of school and public lands, and an attorney-general, all elected for terms of two years. The judicial authority is vested in a Supreme Court, circuit courts, county courts, and justices of the peace, and such other courts as may be created for cities and incorporated towns. The constitution contains a "bill of rights," guaranteeing that the right to worship God according to the dictates of conscience shall never be infringed; that no person shall be denied any civil or political right on account of his religious opinions; that no person shall be compelled to attend or support any ministry or place of worship against his consent; and that no money or other property of the State shall be given for any religious or sectarian purpose. The voting privilege is extended to every male person who is a citizen of the U. S. or an alien who has declared his intention of becoming a citizen, who has resided in the U. S. one

year, in the State six months, in the county thirty days, and in the precinct ten days, next preceding any election, provided he is not under guardianship, insane, an idiot, or an unpardoned person convicted of treason or felony. Women with the foregoing qualifications may vote at any election held solely for school purposes. A modification of the Australian ballot law is in force. The constitution authorized the enactment of a State prohibition law. The Legislature passed one in 1891. It was immediately contested, and a county court declared it unconstitutional, but on an appeal in 1893 the Supreme Court affirmed its validity.

History.—The early history of the State is identical with that of NORTH DAKOTA (*q. v.*). In 1890–91 the Indian Messiah craze among the Sioux led to grave apprehensions, the intervention of U. S. troops, and the death of Sitting Bull, a great Sioux chief; in 1893 the Yankton Sioux Indians signed an agreement with U. S. commissioners to cede to the U. S. a large part of their reservation between the Choteau and Missouri rivers; and in 1893 the Legislature passed acts to promote irrigation, to prohibit the introduction into the State of armed bodies of police or detectives, and to create a number of State commissioners.

GOVERNORS OF SOUTH DAKOTA.

Arthur C. Mellette 1889–93
Charles H. Sheldon 1893–

AUTHORITIES.—Child, *South Dakota: Resources, People, Statehood* (1888); Beadle, *Dakota* (1889); Hagerty, *The State of South Dakota: Statistical, Historical, and Political Abstract* (Aberdeen, 1889). WILLIAM H. H. BEADLE.

South Dakota, University of: an institution located at Vermillion by the first territorial legislature (1862), and first known as University of Dakota, but not opened by the Territory until 1883. The city and county opened an independent school in the court-house in 1882, to which they applied the original name, University of Dakota, and erected one building, which was, with the school, accepted as the territorial university by the Legislature in 1883, when the first appropriation was made. The name was changed to University of South Dakota in 1891. It has one brick and two large stone buildings, a 20-acre campus, and 86,000 acres of land. There is a College of Arts and Sciences, with four bachelor and four master courses; colleges of music and business; military and preparatory departments. It has three laboratories and a museum on the "typical" plan. The faculty consists of the president, twelve professors, and three assistants. The students number 275. J. W. MAUCK.

Southey, CAROLINE ANNE (Bowles): poet; b. at Lymington, Hants, England, Dec. 6, 1787. At an early age she wrote for *Blackwood's Magazine* and other periodicals. In 1820 a collection of her pieces was made, which speedily won for her a place in the world of letters. In 1839 she became the second wife of Robert Southey. *The Pauper's Deathbed* is, perhaps, the best known of her poems, which were prevailingly of a moral, religious, and domestic character. Her published works are *Ellen Fitz-Arthur*, a poem (1820); *The Widow's Tale, and other Poems* (1822); *Solitary Hours*, prose and verse (1826); *Chapters on Churchyards* (1829); *The Birthday*, a poem (1836); *Tales of the Factories*, in verse; and *Robin Hood*, a fragment of a poem begun jointly by herself and her husband, to which were added other fragments by both (1847). D. at Lymington, July 20, 1854. See *Southey's Correspondence with Caroline Bowles*, by Dowden (1881). Revised by H. A. BEERS.

Southey, ROBERT: author; b. at Bristol, England, Aug. 12, 1774, the son of a linen-draper. Early left an orphan, he was cared for by an uncle; received his early education at Westminster School; in 1793 entered Baliol College, Oxford, with the design of taking holy orders, but, becoming unsettled in his religious and political views, left Oxford after two years, and entered upon a career of authorship in verse and prose, his first published work being a small volume of poems (1794). In 1795 he married Edith Fricker, whose sister soon after became the wife of Coleridge; set out with his uncle for Portugal; published an account of his six months' residence (1797); was made secretary to the Chancellor of the Exchequer for Ireland, a sinecure with a

salary of £350; resigned the position, and in 1804 settled for life at Keswick in the lake country. From this time his life is mainly the history of his numerous writings in almost every department of literature. In early manhood he had imbibed strong radical ideas; proposed, in conjunction with Coleridge and Lovel, to set up a socialist community or "pantisocracy" on the banks of the Susquehanna; and wrote a drama, *Wat Tyler* (printed in 1793, but first published in 1817, without his consent), which was denounced in the House of Commons as seditious. In the course of years he went over to the opposite extreme of conservatism in Church and state, and became considered the exponent of high Tory opinions. He was named poet-laureate in 1813. In 1807 he received a Government pension of £160 a year, increased to £460 in 1835. His wife, who had for several years been hopelessly insane, died in 1837, and two years afterward he married Caroline Bowles. (See SOUTHEY, CAROLINE ANNE.) But Southey's own faculties had begun to give way, and on the day when he brought his wife to their home he fell into a state of mental prostration which soon grew into complete imbecility, that continued to his death, on Mar. 21, 1843. Southey's principal poems are *Joan of Arc* (1795); *Thalaba the Destroyer*, an Arabian tale (1801); *Madoc*, founded on legends of early Welsh voyages to America (1805); *The Curse of Kehama*, based upon Hindu mythology (1810); *Roderick, the Last of the Goths*, founded on Spanish history (1814); *A Vision of Judgment*, an apotheosis of George III. (1821); and *A Tale of Paraguay* (1825). Among his numerous prose works are *History of Brazil* (1810–19); *Life of Nelson* (1813); *Life of John Wesley* (1820); *History of the Peninsular War* (1820–32); *Book of the Church* (1824); *Sir Thomas More, or Colloquies on Society* (1829); *Life of John Bunyan* (1830); and *The Doctor* (1834–37). He also contributed largely to *The Quarterly Review* for many years. His poetical works were collected by himself (10 vols., 1837), and have been several times republished in different forms. His *Life and Correspondence*, edited by his son, Rev. C. C. Southey, appeared in 1849, and a selection from his *Commonplace Book*, by his son-in-law, Rev. J. W. Warter, in 1856. Southey was one of the most indefatigable and voluminous of English authors, his published works in verse and prose numbering over 100 titles. His reputation as a poet, imposing in his own lifetime, has steadily declined. His poetry is commonplace, without inspiration, spontaneity, or charm of style. A few of his less ambitious pieces, such as *My Library*, *The Holly Tree*, and *The Battle of Blenheim*, keep a place in popular remembrance. Of his prose writings the lives of Nelson and Wesley are among the best, and indeed are among the best standard biographies in the language. His whimsical and mystifying book *The Doctor* is a favorite with many readers. The worth of Southey's character, his wide learning and incessant productivity, his dignified social standing, and his intimate association with Wordsworth and Coleridge, men of a higher genius than his own, still make him an important figure in English literary history. Revised by H. A. BEERS.

South Framingham: village; Framingham town, Middlesex co., Mass.; on the Boston and Albany and the N. Y., N. H. and Hart. railways; 21 miles W. by S. of Boston, and 23 miles E. of Worcester (for location, see map of Massachusetts, ref. 2–G). It contains 8 churches, a national bank with capital of \$100,000, 2 saving-banks, and 3 weekly newspapers, and is principally engaged in the manufacture of straw goods, woolens, shoes, paper, and rubber goods. Pop. (1890) not separately reported.

Southgate, HORATIO, D. D.: clergyman and author; b. at Portland, Me., July 5, 1812; graduated at Bowdoin College 1832, and at Andover Theological Seminary 1835; took orders in the Protestant Episcopal Church 1836; traveled as a missionary in the East; was chosen missionary bishop of Constantinople 1844; resigned his charge in 1850 and returned to the U. S. the following year, in which he became rector of St. Mark's, Portland, of the Church of the Advent, Boston, 1852, of Zion church, New York, 1850–72, and of St. Thomas church, Ravenswood, L. I., 1882. The episcopate of California was tendered to him by a convention of clergy and laity, but the plan miscarried. D. Apr. 11, 1894. He was the author of *A Tour through Armenia, Kurdistan, Persia, and Mesopotamia* (New York, 2 vols., 1840); *A Visit to the Syrian Church of Mesopotamia* (New York, 1844); *The War in the East* (1855); and *Parochial Sermons* (1859). Revised by W. S. PERRY.

South Georgia: a group of uninhabited islands, generally considered, to lat. 54° 30' S., lon. 30°-32° W., nearly 900 miles E. by S. of the Falkland islands, of which they are a dependency. Area about 1,000 sq. miles. They were first discovered in 1833.

South Hadley: town (incorporated in 1733); Hampshire co., Mass.; on the Connecticut river, which here has a fall of 30 feet, and near the Boston and Me. and the N. Y., N. H. and Hary. railways; 4 miles S. E. of Northampton and 14 miles N. of Springfield (for location, see map of Massachusetts, ref. 8-15). It is the seat of Mount Holyoke College, one of the oldest collegiate institutions for women in the U. S., and contains the villages of South Hadley and South Hadley Falls; a high school, 21 public schools, 5 churches, and saw-mill, and saw mills. In 1894 it had an assessed valuation of nearly \$2,000,000. Pop. (1890) 2,529; (1896) 3,261. HARRISON R. HANSEN.

Southington: town (incorporated in 1779); Hartford co., Conn.; on the N. Y., S. H. and Hary. Railroad; 24 miles N. of New Haven (for location, see map of Connecticut, ref. 9-11). It has manufactories of gunnery and carriage hardware, harness supplies, pocket cutlery, wood screws, and casing and floor plates, and contains the Lewis High School, a national bank with capital of \$100,000, a savings-bank, and a weekly newspaper. In 1894 it had an assessed valuation of over \$2,000,000. Pop. (1890) 5,411; (1896) 5,501. WILLIAM J. HOLLIES, editor of "Pulsis."

South McAlester: town; Choctaw Nation, Ind. Terr.; on the Choctaw, Okl. and Gulf Railroad; 64 miles W. of Winter Junction (for location, see map of Indian Territory, ref. 4-7). It is in a rich coal-mining region, and contains a private bank and three weekly newspapers; and in 1895 was made the headquarters of the part of the U. S. Geological Survey detailed under act of Congress to make a survey of the territory preparatory to its being opened to general settlement. Pop. (1894) estimated, 2,500.

South Manchester: village; Manchester town, Hartford co., Conn.; on the N. Y. and New England Railroad; 9 miles E. of Hartford (for location, see map of Connecticut, ref. 8-1). It is noted for its extensive manufactories of silk and paper, and contains a public library (founded in 1879) and a weekly and a monthly periodical. Pop. (1890) not separately reported.

South Norwalk: city; Fairfield co., Conn.; on Long Island Sound, the Norwalk river, and the N. Y., N. H. and Hary., and the Shesung, Litch and N. railways; 33 miles E. W. of New Haven, and 42 miles N. E. of New York (for location, see map of Connecticut, ref. 13-D). The city has a fine harbor and an excellent harbor. The surface begins to rise within the city limits and in the western suburbs reaches an altitude of 160 feet above sea-level, affording choice locations for residences, with extensive views of the Sound and harbor. Steam freight-boats ply between the city and New York all the year and passenger boats during the summer season. The city contains a public high school, 2 opera-houses, 2 electric railways, a public library (founded in 1877), 7 national banks with combined capital of \$200,000, a savings-bank, and a daily newspaper. The chief industries are the manufacture of hats, vests, shoes, hosiery, bronze goods, fire-pumps, steam-engines, machinery, air-compressors, stone and earthenware, and paper boxes; ship and boat building; and the cultivation of oysters. Pop. (1880) 8,736; (1890) not separately reported; (1895) 6,152.

EDITOR OF "EVENING SENTINEL."

South Omaha, Neb.: see OMAHA.

South Orange: village and township; Essex co., N. J.; on the Rahway river, and the Del., Lack. and West, and the Newark and S. Orange electric railways; 15 miles W. of New York and 5 miles N. W. of Newark, the county-seat (for location, see map of New Jersey, ref. 2-D). It is pleasantly located on the Orange Mountains, has many fine residences, particularly of New York business men, and contains a new town hall (completed in 1895), Seton Hall College (Roman Catholic, opened in 1856), a Roman Catholic parochial school, 3 public and 3 private schools, a public library, and a weekly newspaper. Valhalla, formerly a part of South Orange township, between South Orange and Newark, was incorporated as a borough in 1894. Pop. of South Orange (1890) 2,178; (1896) 3,106; (1895) estimated, 5,000. EDITOR OF "BULLETIN."

Southport: town; in Lancashire, England; at the mouth of the Ribblesdale estuary; 18 miles E. of Liverpool (see map of

England, ref. 7-K). Southport from being a sandy waste has rapidly developed into a popular watering-place. It has an esplanade 2 miles long, a pier (1,465 yards), a pavilion and winter gardens, a public library and art gallery, a market-hall (1891), schools of science and art (1897), besides large baths, hotels, etc. Pop. (1891) 43,000.

South Sea Bubble: a financial speculation which arose in England about the same time as Law's Mississippi Scheme in France. The South Sea Company was established by Lord Treasurer Harley in 1711 with the design of providing for the extinction of the public debt, then amounting to about £10,000,000. The debt was assumed by a number of merchants, under an engagement of the Government to pay 6 per cent. interest for a certain period, covering this sum by holding permanent certain import duties. The Government further granted the purchasers of the fund a monopoly of the trade to the South Sea or the coast of Spanish America, and the company was organized under the name of the South Sea Company. Though the South Sea trade yielded no great profit, the company flourished from the prevailing delusion with regard to the riches of Spanish America, and business as well established as to tie with the Bank of England in controlling the finances of the country. In 1720 the company assumed the entire debt of over £20,000,000, bearing interest of 5 per cent. The ministers intended to give the South Sea Company a good bargain, but when the plan was proposed in the House of Commons that body voted to open the scheme for competition to the Bank of England also. The company was thus compelled to offer £7,500,000 for its privilege. Notwithstanding this drawback the stock of the company was in great demand, making the extravagant expectation of profits from the American trade and the prevalent rage for speculation. It was increased by successive subscriptions, the price of shares rapidly rising till £1,000 was paid for a single share of £100. Other bubbles were started, such as schemes for a fishery of rocks, to make salt water fresh, to make oil from sun-flowers, to extract silver from lead, all with promises of enormous profits. For lack of other room the streets near Change Alley were filled with desks. The action of the South Sea Company itself in proceeding against some of these bubbles turned attention to its own affairs, and distrust arose, under which the stock rapidly declined. Confidence was further weakened when it became known that some of the directors had sold out. The news of the failure of Law's scheme and its consequences in Paris opened all eyes to the delusion, and as the year 1720 closed the bubble burst, bringing ruin to the company and to thousands of families.

Revised by P. M. CONAY.

South Shetland or New South Shetland Islands: an Antarctic Archipelago, directly S. of South America; between 61° and 63° 30' S. lat., consisting of Clarence, George First, Livingston, and Smith islands. Area about 850 sq. miles. The islands are mountainous, destitute of vegetation, in the interior covered with perpetual snow and ice, and rise out of very deep water. They were discovered in 1819, and are visited by whalers, but navigation is dangerous on account of the ice.

Revised by M. W. HARRISOTON.

Southwell: Rector: ecclesiastic and author; b. at Barcham St. Faith's, Norfolk, England, in 1599; educated in Paris and, it is said, also in the Roman Catholic seminary at Douay, France; became a Jesuit at Rome 1578; prefect or rector of the English Jesuits' college at Rome 1583; went as a missionary to England 1586; chaplain to Anne, Countess of Arundel, and secretly administered the rites of his Church to the English Roman Catholics; was thrown into the Tower July, 1592, on an accusation of complicity in a plot against Queen Elizabeth; was ten times subjected to torture, but made no confession beyond that of being a Jesuit and having exercised his priest's office; was condemned to death for constructive treason in refusing to take the oath of supremacy Feb. 22, 1595, and on the following day was hanged, drawn, and quartered at Tyburn, meeting his fate with firmness and composure. He was the author of several pieces of prose and verse published in London immediately after his death, among which were *The Triumph over Death* and *Epistles of Comfort to those Catholics who Lie under Persecution*. A complete edition of his *Poems* appeared in 1856 (London).

Revised by S. M. JACKSON.

Southwest Pass: See LAURENSBURG.

Southworth: COOPERAGE: colonist; b. at Leyden, Holland, in 1614, son of Edward Southworth, a merchant and

[Russian] does when they come into conflict with those passed by another? What shows conclusively that the States can not be said to have received an undivided sovereignty is that they expressly vested the right to punish treason—and reason against their separate power, lest treason against the U. S. Treason is an offense against sovereignty, and sovereignty must reside with the power [able] to punish it." See also article (Hauptmann, Hermann), LAW, MOVEMENT, NATION-STATE, HERRMANN, and TREASON.

Revised by T. S. WOODRUFF.

Sowerby, James, paleontologist and botanist; b. at Lambeth, London, May 31, 1737. Among his works are *English Botany*, containing colored figures of all the native plants of Great Britain, 388 vols., with descriptions by Sir James E. Sowerby, 1793-1807; supplement by his son, James De C. Sowerby, 4 vols., 1813-49; new ed. by J. T. R. Sowerby, 11 vols., 1903-15; *English Fungi or Mycetozoa*, with 440 colored figures of vols., 1797-1803; *British Mineralogy*, with 500 colored plates (6 vols., 1804-17); *Earth. Mineralogy*, with 329 colored plates (2 vols., 1811-17); and *Mineral Conchology of Great Britain*, with 993 plates (6 vols.; the last two by his son, J. De C. Sowerby, 1812-35). D. Oct. 25, 1822.

Sowing and sowing machines: the act or process of depositing seed in the ground, and the machines used for the purpose. When seeds are deposited singly or with only a few in a definite spot, the act is usually called *planting*, the sowing being restricted to cases where the seed is thrown broadcast or deposited in rows or drills. Sowing or planting is usually performed in the spring, but sometimes, and with some kinds of crops, in the autumn, so that the plants may have a fair start when the spring opens. The seeds are usually covered over by harrowing, brushing, or rolling the soil after they have been deposited. As a rule, it may be laid down that when the soil is rather firm and the climate moist, little depth of covering is required; but when the soil is loose and the climate dry, the seeds should be covered to a depth of twice or more than this thickness. Machines, more or less complex, have been found from time immemorial for performing the operation of sowing or planting in all its forms. Some scatter the seed broadcast, others diffuse it into the ground in rows or drills, and some cover it, the general principle being that the drills should be at such a distance apart that a furrow, drawing a light plow may pass between the drills without injuring the plants. In the larger machines, often drawn by horse-power, the seed is often placed in small cups, from which it issues through tubes so arranged as to allow them to drop regularly into shallow furrows cut by coulters just in front of the sowing-machine of the tubes, the furrows being closed up by a kind of rake or harrow following immediately after and forming a part of the machine. There are many kinds of sowing-machines and planters in use.

Revised by L. H. HANLEY.

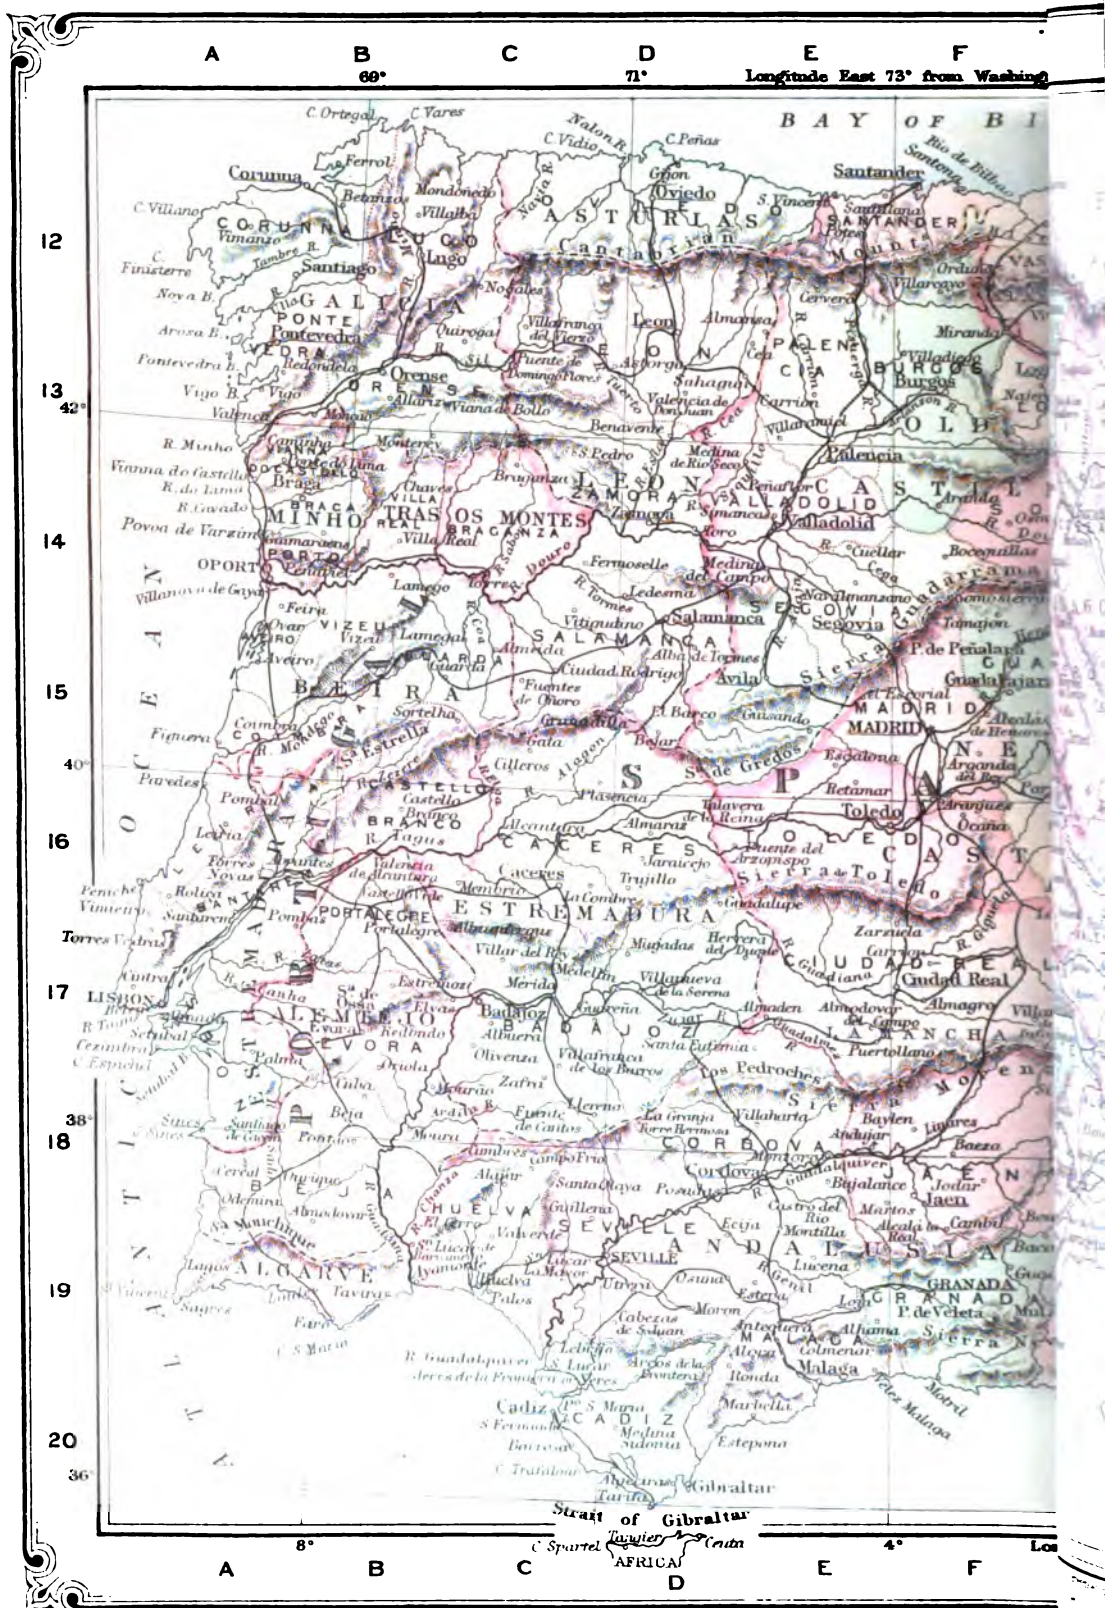

Soy bean, the *Melilot* (or *Soybean*), a bean extremely grown in Japan, China, India, and the Spice Islands, where it is much used as food. The same culture is in, some regions, made of boiled soy-beans, mixed with wheat, and fermented. It is then called and mixed with water, and after daily stirring for a long time the supernatant liquid is poured off and preserved for use. Good soy is a greenish and excellent sauce, and is believed to improve the soil. The plant is coming into notice in the southern parts of the U. S. for forage. Revised by L. H. HANLEY.

Soyer, Jean-Louis, Atlix: cook and author of books on cookery; b. at Marseilles, France, 1800; served as cook in several restaurants in Paris; went to London in 1820; was cook in the Reform Club in that city 1827-39; during the war in the Crimea voluntarily visited the British camps and suggested to introduce a better system of cookery for the soldiers. He published *Culinary Requisites* (1843); *Culinary Requisites* (1847); 2d ed., 1861; *Modern Cookery* (1867); new ed., 1877; *Modern Cookery* (1887); *Culinary Campaign* (1887); and other works. D. Aug. 1, 1890.

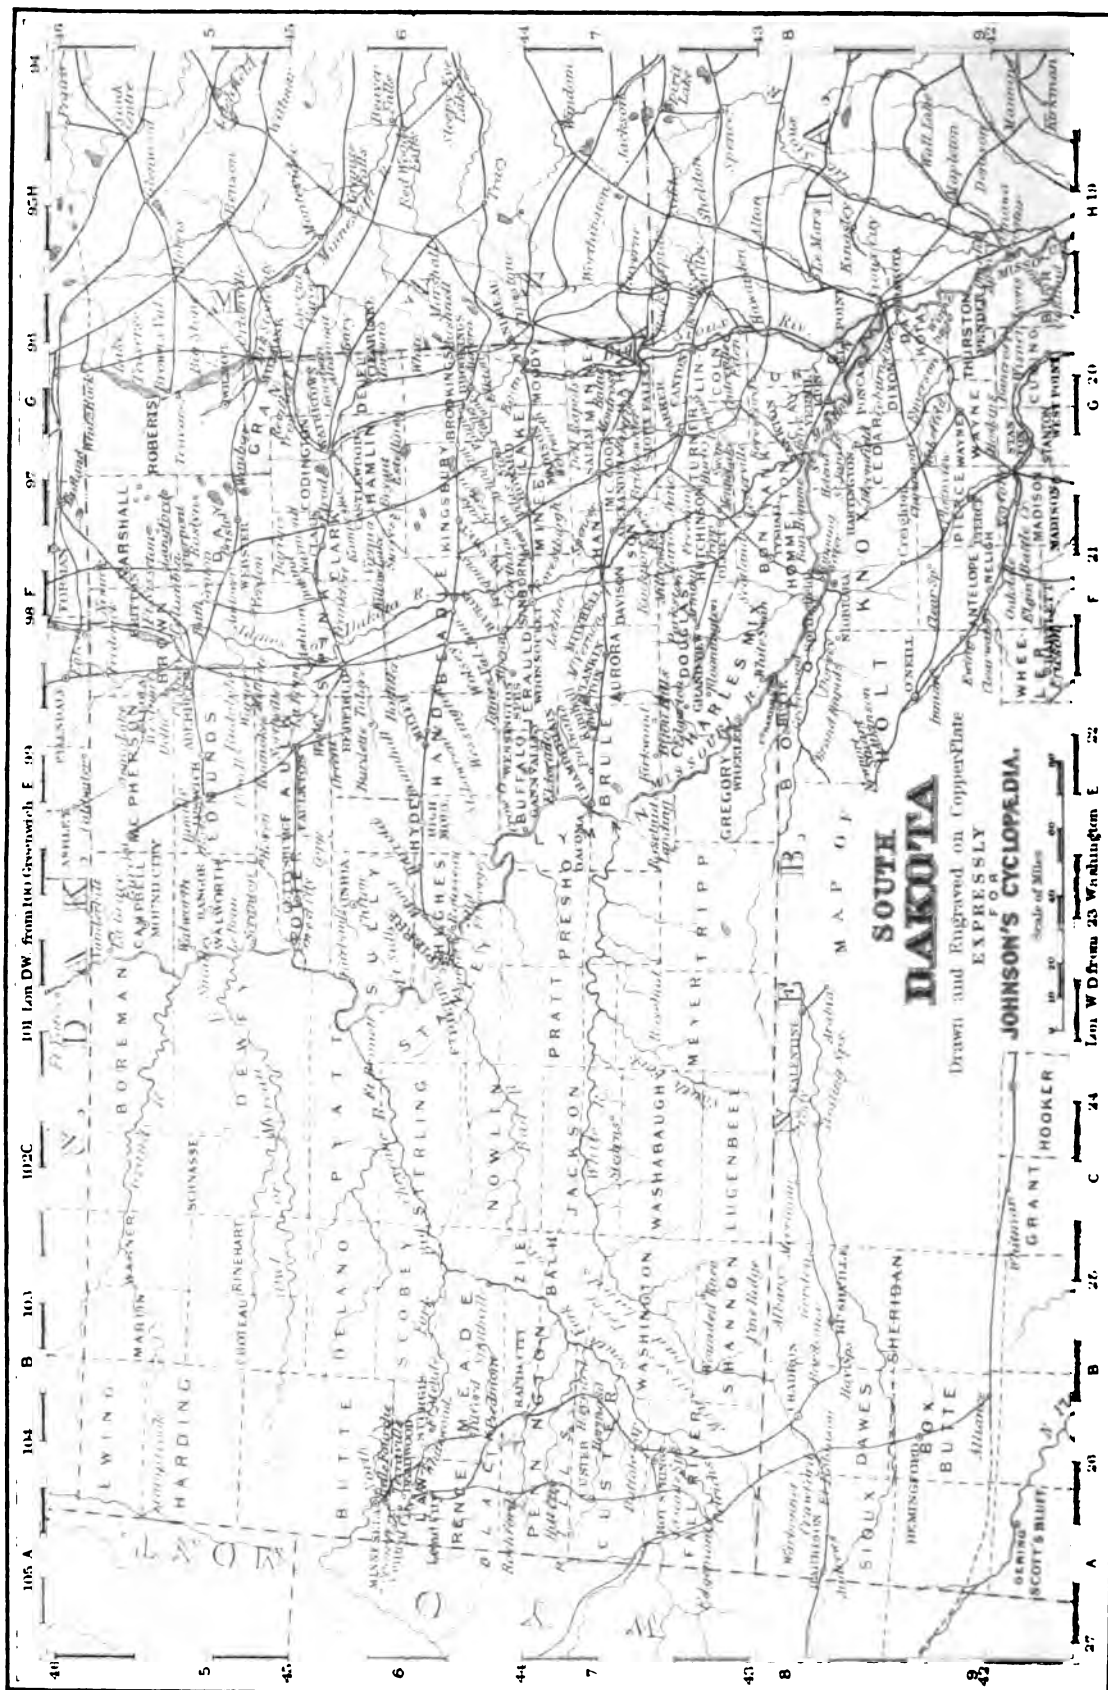

Space, 181 D. Pn from Lat. *spatium*, room, space; interv. in *spatium* (interv. as defined by Aristotle (*Phys.* iv, 1-3), "the first and unmeasured limit which bounds body" when the body is in motion or place; taken as space in general, it is the unmeasured limit of whatever is moved"—i. e. of all things. Time, on the other hand, should be, according to Aristotle, the measure and measure of movement. The existence of continuous is evident, he says, from the fact that things

change place; yet in spite of its three dimensions it is not to be confounded with body, for in that case two bodies would coincide; it is not vague; there is no place in which space itself exists; nor does space grow with what grows. Matter and form are inseparable, but extension and limiting surface are separable; hence matter and form do not explain them, as was thought by Plato in the *Timæus*, where he makes space to be the primitive matter of the universe; it is not form, for space remains when the form is removed. In those distinctions Aristotle lays especial stress on the idea of unity, negation, difference in relation to body as essential to the definition of space. In philosophy there is scarcely any subject upon which there is more important diversity of opinion or more fruitless attempts at definition. The difference, however, is not really so great as it seems. Space has been made identical with pure extension, but this leaves no definition for time, which likewise involves extension. Leibniz made it "the order of things existing, as time is the order of things successive," so that if the totality of things could be moved, space, being their arrangement, would likewise be moved. It has been defined to be pure nothing, thus omitting its specialising attribute, but while "nothing" may be regarded as the potentiality of all of events and ideas as well as of bodies, space can be regarded only as the potentiality of bodies. It has been made an accident or attribute or relation inhering in bodies; but this would involve the absurdity that annihilation of bodies destroyed space. As the ultimate logical condition for the coexistence of bodies space is itself a correlate of time as regards motion and actually existing matters; time by itself being the ultimate logical condition of all extension. As ultimate logical condition it has quite frequently been identified with the infinite, or made to be a divine attribute. Sir Isaac Newton suggested that God for existing constitutes time and space. Samuel Clarke expanded this suggestion into a system of theology, and held a long discussion with Leibniz on the subject. Again to this view is that which makes space and time to be forms of mind when it thinks nature. Kant laid great stress on this, making space and time subjective forms of intuition and devoid of objective validity as regards "things in themselves." By this, however, he must not be understood to mean that they are subjective to the more individual mind, and to be removed validity as regards objects in nature and history; for Kant regards all nature and all history as necessarily conditioned in and through space and time. His doctrine, therefore, does not narrow or belittle space and time, but only magnifies and glorifies mind, which is thus shown to transcend the world and to be of an eternal nature.

Much later has been expended by sensualists on the problem of accounting for the origin of the idea of space. Locke thought that he could trace it to the series of touch and sight; most of his followers have adopted the same doctrine, making it a generalization from experience gained in the perception of bodies. Accordingly, they ignore in different ways the attributes of universality and necessity which are the distinctive characteristics of a *a priori* idea, and make unbroken custom or habit to be the explanation of the inability or impotence of the mind which we call its immutability. That geometry rests upon the *a priori* organization of space, as arithmetic and algebra rests upon a similar cognition of time, is not denied by them. But Kant saw and stated with great clearness the grounds for all transcendental or spiritual philosophy as involved in the question, "Are *a priori* synthetical judgments possible?" i. e. Can we construct the universal and necessary conditions of experience? The answer being affirmative, instancing mathematics, the next question is, "How are they possible?"—that is, What does this presuppose in regard to mind? Instead of deriving the idea of space from experience in regard to bodies, he saw that by no possibility could the mind conceive a body in the first instance without already having the idea of space. The mind uses the idea of space as an indispensable instrument in thinking the idea of a body. Moreover, space is not a generalized idea (discursive), inasmuch as it is not abstracted from spaces, but is thought as the logical condition of all possible spaces or bodies, and therefore as infinite from the first. (See refutation of Hamilton's doctrine of the inconceivability of infinite space in article on INFINITE.) Hegel enters in his view of space the doctrine of the Christian Mystics with that held by such thinkers as Newton and Clarke; making God's thinking and willing to be identical, he holds this self-knowledge to be a creation of the world—the making

were enfranchised, and a constitution was adopted in 1868, upon which the State was restored to the Union in June of that year. In 1870 the State Government fell into the hands of less more intelligent citizens.

Military History.—Three years after Bayle landed the Spaniards attacked the colony unsuccessfully. Cardenas's colony at Fort Royal was destroyed by them in 1696. In 1702 Don. Moore headed a costly and abortive expedition against St. Augustine, and four years after Gov. Johnson defeated a combined French and Spanish attack on Charleston. The Yamasee and Tuscarora Indians were defeated after a severe struggle. Carolinians accompanied Oglethorpe on his ill-starred campaign against Florida in 1733, and were compelled to repel a similar attack. Pirates infested neighboring waters, and Bennett and his crew were hanged in Charleston harbor 1718-19. Indians joined the British during the Revolution, but were driven from the State in 1777. The back country, having been settled by inland migration, had little communication with the coast. Lack of tribulation in the interior led to the formation of bands of regulators, who in time became involved with the court. The Revolutionary war renewed old feuds, and partisan warfare was desperate between the regulators or Whigs and the Sevilleites or Tories, who were finally crushed. In 1812 Gen. Hampton fought in the Northwest. During the Seminole war South Carolina sent many companies of troops to Florida. In the war with Mexico the Palmetto Regiment fought gallantly, and was the first to plant a banner on the walls of the Montezuma. In the war of 1861-65 South Carolina soldiers displayed great valor. At the time of Sherman's march every able-bodied white male between sixteen and sixty years of age was in service.

ROBERT MEANS DAVIS.

Southwell. JESSICA: religious enthusiast; b. at Abington, Devonshire, England, Apr. 1750; was a domestic servant at Emsay; joined the Methodist Church about 1769, and in 1782 announced herself as a prophetess, giving forth extraordinary series of revelations in ungrammatical prose and disjointed verse, e. g., *Effects of Faith* (1801), *True Exposition of the Bible* (1804), *The Book of Wisdom* (1810-14), *Prophecies announcing the Birth of the Prince of Peace* (1814), and many others, and obtained such success that in a few years her followers were numbered by thousands. She established herself at London; announced herself as the

woman spoken of in Rev. xii. as being driven into the wilderness, and 6,100 sealed packets in her followers, which were warranted to secure the salvation of the purchaser; and at last declared herself pregnant, and that she should give birth to "Shiloh" or "the Prince of Peace" at midnight on Oct. 10, 1814, but the occasion was marked only by the prophetess falling into a trance. She died in London, Dec. 21, 1814. A post-mortem examination showed that she had been suffering from dropsy. Four congregations of believers, comprising 188 persons, were reported in England by the census of 1851, a community was founded at Walslop in 1807, and they were not extinct in 1867. See Roberts, *Observations on the Divine Mission of Joanna Southwell* (1807); Richard Ross, *A Correct Statement of the Circumstances that attended the Last Illness and Death of Mrs. Southwell* (3 vols. 1815); D. Mathias, *The Case of Joanna Southwell* (1815), and *Joanna Southwell's Prophecies and Case stated* (1853). Revised by R. M. JAMES.

South Dakota: one of the U. S. of North America (North Central group). The twenty-seventh State admitted into the Union.

Location and Area.—The State lies a little N. of the center of the continent, on the middle section of the Missouri river, between lat. 43° 37' N., and 49° 29' N. (extreme south-east point); W. of the Missouri the boundary is 40° N., and between lat. 90° 20' (extreme west point) and about 104° 03' W. of Greenwich—the west boundary is 27° W. of Washington. It is bounded on the N. by North Dakota, E. by Minnesota and Iowa, S. by Nebraska, and W. by Wyoming and Montana; extreme length from E. to W., 696 miles; extreme breadth N. to S., 240 miles; area, 76,700 sq. miles, excluding the rivers (Missouri and Big Sioux) and lakes (Big Stone and Traverse) which form part of the boundary of the State; those portions of these properly belonging to South Dakota have an area of about 115 sq. miles.

Physical Features.—The Missouri river divides the State into two nearly equal portions. Except a very limited area at the northeast corner, the southeast part is lowest, and all the State slopes and all the streams flow in that direction. That part E. of the Missouri river is generally smooth and gently rolling in surface, rising into hills in a small area in the northeast part and in the central part near the Missouri where are the Westington Hills and Rose Heights. W. of the Missouri the country rises more rapidly and culminates in the Black Hills, an elevation in elliptical form about 100 by 60 miles in extent, the central point of which is Harney's Peak, with an elevation of 9,790 feet. The western half is more rolling and broken, but has a large part of smooth lands. The Bad Lands (French, *Nascentes Terres*), near the head of White river and extending into Nebraska, are a striking feature, with cañons, depressions, walls, and masses of white earth, a desert region rich in soil-making elements and abounding in highly interesting fossils. The gently sloping lands of the eastern portion, and the intervals and parks of the Black Hills and the valleys near them, are the most fertile soils. The river-bottoms are very rich and fertile, while the more rolling or hilly lands are dry and less productive. The Big Sioux river flows S. near the east border, and forms the boundary for 75 miles. Its current is somewhat swift, and there are rapids falling 110 feet at Sioux Falls. The Dakota (or James) river, 90 miles W., is a sluggish stream 200 to 400 feet lower than the Big Sioux. The surface rises westward from this stream, which is thus at the bottom of a wide trough or valley, and follows what was the preglacial course of the Missouri, the latter stream forming its new

Great Seal of South Dakota.

TILDEN FOUNDATIONS.

limestone, in Andalusia, are very important; copper is worked in many places, principally in the N. of Huéscar; alumina has been taken out at Almadén from the time of the Romans; and rock-salt, marble, plaster, mineral fertilizers, and coal offer large resources. In 1898 the production of copper was 4,994,416 tons, valued at nearly \$4,000,000; the value of the coal was about twice as much, and of argentiferous lead about \$3,200,000. Of the copper ore, over 90 per cent. was exported, chiefly to Great Britain. In 1894 over 15,000 mines were registered, of which about 2,000 were worked.

The wealth of Spain in mineral and thermal springs is even more unique than her wealth in minerals. In 1765 Bedoya enumerated 2,000 such springs; in 1844 the number of such springs actually used by the sick surpassed 1,200, while in France the number was 804. These springs are generally at the foot of the Pyrenees and of the Sierra Nevada. Guipúzcoa, the smallest of the provinces, has the largest number, 84 springs, of which 35 have accommodations for bathing; next is Granada, with 63 springs and 25 baths; then Malaga, with 36 springs and 63 baths.

Of the lands, 50 per cent. is classed as productive, and of this 84 per cent. is devoted to agriculture, 21 to fruits, 30 to meadows, 4 to vineyards, and 2 to olives. The great variations in altitudes permit the productions to range through those of the sub-tropical and temperate zones. The cereals are abundant and of excellent quality. The leading crops are wheat, rye, barley, maize, rice, esparto, flax, hemp, and pulses. The product of wine is very large and highly valued; it is the chief item of export; value in 1895, 110,119,728 pesetas (\$69,033,045). Raisins, almonds, oranges, olive oil, and conserves are also exported in great quantities. Cork is chiefly furnished by Spain, though the cork-tree grows in Southwestern Europe and Northern Africa. The exported Spanish product in 1899 was valued at over \$5,000,000. Pastoral pursuits occupy the peasantry of the interior, and the Spanish flocks of sheep, cattle, and horses are all celebrated for excellence. The wool export in 1892 was valued at \$1,000,000, and that of hides and skins at \$5,000,000.

Commerce.—The imports of merchandise in 1894 were valued at 644,564,970 pesetas (\$166,964,966) and the exports at 630,631,332 pesetas (\$155,356,306), and the imports of the previous metals at 26,042,000 pesetas (\$5,208,409) and exports at 270,000 pesetas (\$2,653,900). The imports are chiefly wheat, cotton, raw or manufactured, coal and coke, drugs and chemicals, sugar, machinery, tobacco, and woolen goods. The chief exports were wine, minerals and ores, cork, hides and skins, cotton, textiles, fruits, oil, and wool. The trade is chiefly with France, Great Britain, the U. S., and the colonies. The merchant navy consisted in 1894 of 302 steamers and 368 sailing vessels of over 100 tons. In 1893 14,159 vessels entered and 16,059 cleared from the Spanish ports, and about half carried the Spanish flag.

In 1894 there were 6,703 miles of railway open, all of private ownership. In the same year there were 15,248 miles of telegraph line, with 41,141 miles of wire.

The unit of money is the *peseta*, of the value of a franc, or about 30 cents. The gold coins in common use are worth 5, 10, and 20 pesetas, and the silver coins 1 and 5 pesetas. Weight and measure are those of the corresponding French coins. The ratio of gold to silver is 15½ to 1, and the 5-peseta silver piece is legal tender. The metric system was introduced in 1839, but the old weights and measures are still largely used. The *libro* is 1,014 li. avoirdupois, and the *quintal* = 100 libras. The *arroba* = 3½ imperial gal. for wine or 2½ gal. for oil, and the *fanega* = 1½ imperial bush.

Administration.—Spain is a monarchy, under the constitution of 1876. The legislative power is vested in a parliamentary body called the Cortes, consisting of a Senate and a Congress. The senators in part hold life positions by inheritance or *ex officio*, in part are nominated by the crown, and in part elected, and together number not more than 360. The Congress has 401 elected deputies. All are elected for five years, or until the Cortes are dissolved by the crown. The ministry is responsible, and consists of nine members. The local governments are generally representative.

For the fiscal year 1899-00 the total revenue was 507,338,172 pesetas (\$114,470,634) and expenditures 754,444,090 pesetas (\$150,898,936). The revenue is derived from direct and indirect taxation, stamp-duties, monopolies, and income of public property. The monopolies are the tobacco-trade, the lottery, the mint, and others. The public debt of all kinds on Jan. 1, 1899, exceeded 7,129,000,000 pesetas (\$1,425,800,000), and the principal item in the public expenditure is the payment of the interest charges.

Spain possesses about fifty fortified places, mostly ports, but Gibraltar, which controls the Straits, is in the hands of the British. The permanent army consists of 115,733 men, and this force can be increased to 1,000,000 in case of war. In the Philippines there are 6,870 troops: in Cuba, 21,000; in Porto Rico, 3,400. There are 13 military schools and colleges. Spain has 1 battleship of the first class, 2 port-defense ships, 9 first-class cruisers, 6 second class, 46 third class, and 60 torpedo-boats, making 97 in all. The navy is manned by 14,000 seamen, 9,000 marines, and 1,000 officers, including engineer officers. The army and navy are recruited by conscription. See ARMY and NAVY OF WAR.

For administrative purposes the Canary islands are considered a part of Spain, and Rio de Oro and Azores are governed by the province of Canarias. Cuba sends deputies to the Cortes. Porto Rico was declared a province of Spain in 1870. The Philippine islands are controlled by a governor-general.

Demographics.—The forty-nine provinces of Spain, including the Canary islands, with population of each, according to a revision of the census of 1857, are as follows:

Province.	Pop.	Province.	Pop.
Alava.....	46,917	León.....	19,460
Alicante.....	246,100	Lugo.....	48,100
Albacete.....	232,500	Madrid.....	1,028,844
Almería.....	279,482	Malaga.....	378,677
Ávila.....	163,400	Murcia.....	491,030
Balearas.....	491,506	Navarra.....	769,152
Barcelona.....	612,000	Orense.....	406,127
Burgos.....	945,000	Oviedo.....	555,439
Caceres.....	234,551	Palencia.....	198,040
Cadix.....	239,730	Pontevedra.....	440,585
Cantabria.....	168,872	Salamanca.....	314,473
Castile de la Mancha.....	592,437	San Sebastian.....	344,274
Castile de Leon.....	592,437	Segovia.....	154,143
Cataluña.....	592,437	Sevilla.....	344,873
Córdoba.....	437,728	Soria.....	171,539

Jenova.....	407,842	N. and W. coast of Africa.....	5,389
León.....	381,000		
Lerida.....	260,417	Total.....	17,508,022

Population.—The native tribes of the Peninsula known to the Romans may be called Iberian. The present population consists of Iberians, modified successively by intermixture with Celts, Carthaginians, Romans, Goths, Jews, and Moors. With the last came some Negro blood, and to the slight intermixture of this blood is probably due the well-known Spanish and Portuguese capacity for tropical colonization. At the same time from Spain has poured out an enormous wave of migration, which has left its mark on the most of America and several oceanic archipelagoes, and this has had its reaction on purity of Spanish blood. Yet notwithstanding these numerous intermixtures, each lasting through centuries, the people are among the most characteristic, self-contained, and sharply defined of Europe. The linguistic type evolved is essentially Roman, but the ethnic includes the Portuguese, and is clearly distinct from the rest of Europe. The Spaniard, somewhat swarthy, is well-balanced as to virtues and vices, rigorous, original, serious, proud, dignified, courteous, tenacious, patriotic, thrifty, sometimes vain, bigoted, intolerant, and vindictive. In the Roman conquest Spaniards were found gallant and warlike, and when overcome they made the most faithful and conservative of the Roman provinces. They formed a fertile and easy field for early Christian missionary effort, and having accepted the Roman supremacy and Christianity they were tenacious of them, and for the next 1,000 years were chiefly occupied in defending themselves and their religion. With the discovery of America this race displayed to the world its amazing supply of courage, enterprise, and endurance, as well as its indifference to the sufferings of inferior races.

The growth of the population has been slow. Philip II. took a census (imperfect as compared with modern ones) in 1594, giving 8,206,701 inhabitants; in 1797 another census gave 10,268,160—a very small increase in two centuries, due to enormous emigration. The increase during 1877-87 was at the rate of .47 per cent. per annum. The density of population is over 88 per square mile, and decreases from east to center. The females are in surplus of 104 to 100. The principal cities are Madrid (pop. 470,288), Barcelona (272,481), Valencia (170,765), Seville (143,182), and Malaga (104,016), and there are no other cities with a population over 100,000.

In 1889 4,854,742 persons were following agricultural pursuits, 823,310 the arts and trades, 409,549 domestic service, 243,867 industrial (textile and mineral), 194,755 commercial, 115,764 merchant marine, 97,257 public employees, 91,226 were inmates of asylums, etc., 84,510 professional, 72,077 religious, and 1,719,955 were school and college pupils. In 1892 the surplus of emigration over immigration was 8,258. Emigration is chiefly to Brazil, Uruguay, and Argentina.

The national church is the Roman Catholic, and the only professed dissenters in 1887 were 9,645 rationalists, 6,654 Protestants, 402 Jews, and 510 of other religions. In 1884 there were 32,435 priests, 1,684 monks resident in 161 monastic houses, and 14,592 nuns in 1,027 convents. There were 65 cathedrals, 18,564 churches, 30 religious colleges, and 11,202 other buildings used for religious purposes. Since 1876 private Protestant worship has been permitted.

In 1860 only 20 per cent. of the population could read and write; in 1889 this percentage had grown to 28.5. Compulsory primary education is statutory, but is not enforced. In 1885 there were 24,529 public free primary schools and 5,576 private ones, with a total enrollment of 1,843,183 pupils. The secondary schools are less efficient. There are 10 universities with 16,000 students in all; also various special schools supported by the Government.

History.—The colonization of the coasts of the Peninsula by the Phœnicians (Cadiz), Greeks (Saguntum), and Carthaginians (Cartagena) began about 1100 B.C. The Carthaginians extended their conquest over about a half of the Peninsula in the third century B.C. This was inherited by the Romans as the result of the Punic wars, and the conquest was completed 19 B.C. The Spanish provinces were very thoroughly Romanized. The Gothic invasion was begun in the fifth century of our era, but the Gothic kingdom was overthrown by the Arabs in 711, who remained in control of most of the Peninsula for three centuries. Christian kingdoms were gradually established from the eleventh century until the marriage of Ferdinand V. of Aragon and Isabella of Castile united these kingdoms in 1479, and began a career of prosperity, which resulted in the conquest of the Moors and the discovery of America, and gave Spain the form and character which it yet bears. The marriage of Isabella's daughter Johanna with Philip I., son of the Emperor Maximilian, made Spain a part of the Hapsburg empire, with Germany, the Netherlands, Milan, Naples and Sicily, Sardinia, Burgundy, and the colonies, under Charles I. of Spain, V. of Germany (1516). The despotism of Charles was followed by the tyranny of the bigoted Philip II. (1556-98), who, with the aid of the Inquisition, undertook to root out Protestantism, and he with his no less despotic and intolerant successors succeeded in bringing to a close before the eighteenth century the brilliant period of Spanish history, which began with Ferdinand and Isabella. The line of Hapsburg princes closed with Charles II. (1665-1700). On his death followed the war of the Spanish succession (see Succession Wars), which resulted in placing a Bourbon prince on the throne, and with two brief interruptions this dynasty has since remained in power. The first interruption was in 1808-14, during which time Joseph was kept in power by his brother Napoleon. This was the period of the Peninsular war, in which successful resistance to the self-aggrandizing schemes of Napoleon was for the first time offered. Upon the dethronement of their king and the occupation of his throne by Joseph Bonaparte the entire Spanish people rose in arms, and, though ill disciplined and unorganized, showed such vigor and courage as to require the personal presence of Napoleon in Spain in order to restore the French authority. Subsequently, however, he left to his marshals the difficult task of subduing the Spaniards, whose persistent efforts, aided and directed by the military genius of Wellington, resulted in driving out the intruders and contributed to the final overthrow of Napoleon. (For an account of the causes of the Peninsular war, see NAPOLEON I. (*Spanish Campaign*), and for further details WELLINGTON, ARTHUR WELLESLEY, DUKE OF.) The second interruption of the Bourbon rule was from 1868 to 1874, during which years a regency, a short-lived monarchy under Amadeus, and a republic were successively established. The Bourbons were restored Dec. 30, 1874, in the person of Alfonso XII., eldest son of Isabella. He died in 1885, and was succeeded by his posthumous son, Alfonso XIII., with Maria Christina, his mother, as regent. The Government has since passed alternately from a conservative to a progressive ministry, and back, with gradual progress toward greater freedom and more elaborate constitutional rights.

MARK W. HARRINGTON.

Spal'ato, or Spalatro: town and railway station; in the province of Dalmatia, Austria; on a peninsula jutting out into the Adriatic (see map of Austria-Hungary, ref. 10-F). It has a good harbor, is defended by a citadel, and carries on an active trade in grain, cattle, horses, swine, fruits, wine, and rosoglio, besides an extensive transit trade between Italy and Turkey. It is situated near the ancient *Salona*, on the site of the famous palace of Diocletian, called *Salonæ Palatium*, or, in an abbreviated form, *S. Palatium*; hence the name of the modern town. Of the magnificent palace, which covered 8 acres of ground and which it took twelve years to build, many remains are extant. Pop. (1890) 15,697.

Revised by M. W. HARRINGTON.

Spalax: a small rodent (*Spalax typhlus*) having the habits and very much the appearance of a mole. The incisors are large, the molars, three on each side of either jaw, have roots. The external ears are rudimentary, as are also the eyes, which are covered by the skin; the tail is rudimentary; the fore feet modified for digging. The silky fur is of a general yellowish brown; the length is 5 or 6 inches. The animal is also known as the mole-rat. It ranges from Southeastern Europe into Asia.

F. A. L.

Spalding, JOHN FRANKLIN, D. D.: bishop; b. at Belgrade, Me., Aug. 25, 1828; graduated at the North Yarmouth Classical Academy, Maine, in 1849, at Bowdoin College, Maine, in 1853, and at the General Theological Seminary of the Protestant Episcopal Church, New York, in 1857; minister of St. James's church, Oldtown, Me., 1857-59; was rector of St. George's church, Lee, Mass., till 1860, when he became assistant minister of Grace church, Providence, R. I., for one year; rector of St. Paul's church, Erie, Pa., 1862-74; member of the general board of missions from 1865; dean of the Erie convocation Jan., 1866; member of the general convention 1868 and 1871; elected Oct. 24, 1873, by the House of Bishops missionary bishop of Colorado, with jurisdiction in Wyoming and New Mexico; consecrated bishop Dec. 31, 1873, and removed to Denver, Col., in Feb., 1874. He published *The Threefold Ministry* (1864), *Manual of Prayers* (1872), etc., and various articles, sermons, pamphlets, etc. Bishop Spalding has been for many years prominently connected with the movement to promote lay co-operation and women's work in the Church, deaconesses' institutions, and sisterhoods. He has also developed and placed on permanent foundations the educational work of the Church in Colorado, including, under the general charter of the College of St. John the Divine, Wolffe Hall for Girls, a school for boys, a theological training-school, etc.

Revised by W. S. PERRY.

Spalding, MARTIN JOHN, D. D.: bishop; b. in Marion co., Ky., May 23, 1810; graduated at St. Mary's College in 1826, and in 1830 went to Rome to enter the College of the Propaganda; returning to Kentucky, was ordained priest in 1834; appointed pastor of the cathedral church at Bardonia, and established *The Catholic Guardian*, with which he retained his connection until 1858; lectured in favor of Roman Catholicism in the U. S. and Canada, his lectures being published under the title *Evidences of Catholicity* (1847; 4th ed. 1866); in 1848 appointed coadjutor of the Roman Catholic diocese of Louisville; in 1850 became Bishop of Louisville, where he erected a cathedral. In 1864 he succeeded Dr. Kenrick as Archbishop of Baltimore; in 1866, as apostolic delegate, convened the second national council at Baltimore, and drew up the acts of the council. He took a prominent part in the Vatican Council of 1870-71, where he urged an immediate decision on the subject of papal infallibility, but wished it to be indirect and implied, rather than positive and affirmative; but he, with the other Roman Catholic bishops from America, yielded in favor of a positive declaration. His principal works are *Early Catholic Missions of Kentucky* (1844); *History of the Protestant Reformation in Germany and Switzerland*, written in opposition to Merle d'Aubigné (1860); and a translation, with notes and an introduction, of Darraz's *General History of the Catholic Church* (1866). His miscellaneous essays have also been published in book form. D. in Baltimore, Feb. 7, 1872.

Revised by J. J. KEANE.

Spallanza'ni, LAZARO: naturalist and physiologist; b. at Scandiano, duchy of Modena, Jan. 12, 1729; was ap-

joined Professor of Logic, Metaphysics, and Greek at Regensburg in 1704, and at Modena in 1706. At the re-establishment of the University of Pavia in 1708 he became Professor of Natural History, made extensive scientific travels in Italy and Sicily, Switzerland and Germany, Turkey, Asia Minor, Caria, and Cyprus. D. at Pavia, Feb. 12, 1760. His polemics against Needham and Buffon, whose theory of spontaneous generation among the infusoria he contested, attracted special attention, showing by a series of ingenious experiments that these animals originated from germs existing in the atmosphere. Among his works are *Vaggio alle Due Sicilie ed in alcune parti degli Appennini* (Pavia, 1732); *Opuscoli di fisica animale e vegetabile* (Modena, 1780), in which he demonstrated the true nature of digestion; and *Esposizione pour servir à l'histoire de la génération des animaux et des plantes* (1780), in which he determined the relative functions of the ovum and spermatozoa.

R. A. ROMERO.

Spandau, *spān'dau*: an old fortified town and military arsenal, province of Brandenburg, Prussia, at the confluence of the Havel and the Spree; 9 miles W. N. W. of Berlin (see map of German Empire, ref. B-4). The shield stands on an island in the Havel and is used by the Prussian Government as a prison for military and political criminals. The city is well built, has manufactures of busby, wooden fabrics, gunpowder, and arms, and carries on a large transit trade between Berlin and Hamburg. Pop. (1890) 15,065.

Revised by M. W. HARRINGTON.

Spangenberg, August Gottlieb: bishop; b. at Klettenberg, Germany, July 15, 1704; graduated Ph. D. at Jena 1720; became a professor at the University of Halle and assistant superintendent of Franke's orphan-house in the same city 1731; was dismissed at the instigation of the Pietists of Halle because he associated with the Moravians, and had expressed the opinion that Pietistic religion was formal and worldly 1733; naturally on his dismissal he joined the Moravians and became assistant to Count Zinzendorf at Herrnhut. From 1733-62 his care was the superintendence and organization of their missionary operations. With this end he visited England 1734; obtained lands from the trustees of Georgia for a Moravian settlement in that colony; landed at Savannah with nine Moravian settlers, the first who landed in America, 1735; labored as a missionary among his German countrymen in Georgia and Pennsylvania 1735-39, after which he returned to Europe; was instrumental in procuring the establishment of the settlement at Bethlehem, Pa.; founded in London 1741 the first regular Moravian society in England; became general director, and in 1744 bishop, of his Church; proceeded to Pennsylvania the same year; repeatedly visited the Oneida Indians; made another visit to Europe 1749-51; organized a Moravian community in North Carolina 1761; was elected successor of Count Zinzendorf at the supreme council; returned finally to Europe 1762. For the next thirty years he was the guide of the Moravians in the consolidation of the home Church, and paid particular attention to their educational methods. He became in 1760 president of the general directory. D. at Herrnhut, near Herrnhut, Saxony, Sept. 18, 1792. Author of a *Life of Zinzendorf* (9 vols., Harby, 1773-75; shortened English trans., London, 1838, by B. La Trobe), and of *Idem Fidel Proferum* (1776; English trans., *Exposition of Christian Doctrine*, London, 1784; 2d ed. 1796), the authoritative manual of Moravian theology. See the biography by J. Dieter (Harby, 1794); C. F. Loderhose (Herrnhut, 1846; Eng. trans., London, 1855); and G. U. Knapp, *Beitrag zur Lebensgeschichte A. G. Spangenberg's* (Halle, 1884), edited by O. Frick. Revised by S. M. JACKSON.

Spangier's Bay: a fishing-town on the west side of Conception Bay; 7 miles S. of Harbor Grace, Newfoundland; is surrounded by high hills and has some fine views. The inhabitants are mostly engaged in the Labrador cod-fishery. Pop. 1,200.

Spaniards: see *Deas and Seamen*.

Spanish-American Literature: the literature of the Spanish-speaking peoples of America. This is of no recent growth. Early in the sixteenth century civilized communities were established in Cuba, Mexico, Peru, and at the mouth of the Plata; and numerous other localities were rapidly colonized. In succeeding centuries intellectual activity steadily increased; so that Spanish America has furnished a long list of eminent men of letters.

Literary culture was more distinctive of the Spanish colonist than of his northern and Asian brethren. While the natural implements of the latter were the axe, the plow, and the hammer, those of the former were the sword and the pen. Moreover, the British settlers of North America were political or religious reformers who received little attention or support from the home government; whereas the colonization of Spanish America was a national project, in the success of which the sympathies, ambitions, and funds of all classes were involved.

The cities of Mexico and Lima had universities half a century before Cape Cod was discovered; and when Smith had entered the Chesapeake; and when Harvard College was founded in 1636, Spanish America possessed sixteen flourishing universities and colleges, including the Universidad de San Vincente at Quito and the Universidad de Santa Tomás at Bogotá. Peru with its present shrunken boundaries has six universities and 600-odd colleges, and a national library which contained over 50,000 volumes before the war with Chile in 1882, and now numbers about 35,000; Venezuela has two great universities and six smaller ones, together with fifty-four colleges and other higher institutions of learning; the library of the University of Caracas numbers 30,000 volumes. Spanish America produces many extensive and erudite works of history, archaeology, jurisprudence, and natural sciences, and the most beautiful editions of the classics are to be found there. Educational books and works of direct utility are numerous, and descend to such trifling, gardening, cooking, carpentry, and bookbinding. An official catalogue shows thirty-seven native text-books in use in the Argentine schools. Spanish-American thoroughness sometimes tends toward prolixity, and voluminous works are not uncommon. The *Historia de Méjico*, by Nicolás de Zamacois, fills twenty native volumes; and the recent collaboration, *Méjico a través de los siglos*—historical and descriptive, from the conquest to the present day—is embellished with nearly 3,000 illustrations.

A great part of the pictorial and hieroglyphic writings of the native races were destroyed by the Spanish conquerors. Yet considerable fragments remain, such as the *Popol Vuh* and the Inca drama of *Ullucuy*, translated by Carrasco and others. A great amount of labor was expended, especially by the Jesuit fathers, on these relics and the languages to which they pertain. The *Históricas Méjico-antiquarias*, of Brasseur de Bourbourg (Paris, 1871), gives much minute information regarding what has been written on the subject in Spanish America.

Writers of the Colonial Period.—In the early part of the colonial period writers in Spanish America were generally visitors from the Old World. Yet occasionally there appeared American writers whose brilliancy was enhanced by their isolation. Ullá claims an epic poet prior to the seventeenth century in Pedro de Oña, the author of *El Arauco Canónico* (pub. 1595). Mexico had Juana Inés de la Cruz y Ramírez, or Sor Juana Inés de la Cruz (d. 1695). Bred in the viceregal court of Mexico, she dazzled equally by her beauty and her immense learning; then, disappointed in life, she retired to a convent. Contemporary with her was Carlos de Sigüenza y Góngora (d. 1700), also of Mexico, who was one of the most diligent and versatile writers of the age. His works on all subjects from astronomy to rural life would fill a catalogue.

The very interest that was felt in Spain for matters Spanish-American, and which tended as an incentive and a support to culture in the colonies, eventually acted as a detriment; for the literary decadence in Spain from the latter part of the sixteenth century to the beginning of the eighteenth, could not fail to be reflected in the New World. Still there was in such literary blank in the colonies as existed in Spain. The revival which came with the eighteenth century was quickly felt in America, but the initial movement was scientific rather than literary. A long list of eminent physicists and naturalists might be given, but the three most prominent must suffice. José Antonio Alzate y Ramírez (Mexico, d. 1796), besides being a writer of note, did a great deal indirectly for scientific progress by means of the *Gaceta de Literatura*, of which he was editor. In what is now Colombia, Francisco José de Caldas (1696-1770) and José Celestino Mutis (1732-1808) rendered lasting services to natural science. Their investigations were principally in the fields of botany, geology, and astronomy; but their descriptive writings are extremely interesting and entitle their names to honorable places in the literature of the New World. The most distinguished master of style of this

period was Pedro de Peralta y Barnuevo (1670-1748), the Peruvian jurist, historian, and poet. His best-known work is the epic *Lima fundada*.

Writers of the Nineteenth Century.—Poets.—The nineteenth century has naturally produced more eminent writers than all previous ages. Foremost of these is Andrés Bello (b. Venezuela, 1781; d. Chile, 1865), revered in South America for his vast and varied learning and for his labors as jurist, educator, and poet, and conceded even by Spanish critics to be one of the greatest masters of Castilian that the nineteenth century has produced. His georgic *La agricultura en la zona tórrida* is especially admirable both for the beauty of its language and sentiment, and for its faithful descriptions of rural scenes and life in South America.

Spanish-American poetry and fiction, as might be expected, treat principally of three themes—the exploits of the early Spanish conquerors, the struggles of the colonies for independence, and the phases of life peculiar to a new country—which impart to the literature a unique and distinctive local coloring. Moreover, a number of poems and romances are founded on Indian legends, or tell of Indian life and customs, after the manner of Cooper and Longfellow. Two of the best of these are the *Paine* and *Relmú* of the Argentine publicist Estanislao S. Zeballos, who combines every form of literary activity. The earliest work of Juan León Mena (Ecuador, b. 1833) was an Indian epic which earned for him the title of Poet of the Indians. The *Huincahual* of the Chilean Alberto del Solar is one of the most powerful productions of this class. The dialect sketches of Estanislao del Campo, descriptive of the gauchos and life on the pampas, are especially quaint and entertaining. Nearly all the contemporaries of the struggles for independence were inspired by the patriotic deeds of America's heroes, but no one gave them more fitting expression than did the "American Pindar," José Joaquín Olmedo (Ecuador, d. 1857), a classicist of the purest type. His *Canto a Junín* is an epic ode without equal in the language. Some of the patriotic poems of Numa Pompilio Llona, of Peru, are especially fine; and the sonnet to Bolívar by the Peruvian Adolfo García is one of the most beautiful compositions of its kind. The best poetic productions based upon the days of the conquerors are *La grandeza de Méjico* of Bishop Valbuena (d. 1635); the beautiful epic *Gonzalo de Oyón*, by Julio Arboleda (Colombia, d. 1862); and Peralta's *Lima fundada* (already mentioned).

The Spanish language lends itself so readily to versification, especially when assonance is accepted instead of rhyme, that it may almost be assumed that every writer, not a scientific specialist, is also a poet. Juan León Mena published in 1868 a critical history of the poets of Ecuador, at a time when few were aware that that country had ever possessed any. Cuba has, of all Spanish-American countries, produced relatively the largest number of lyric poets. Gertrudis Gómez de Avellaneda, the greatest poetess of the language, was a native of Cuba; and persons of the lowest condition break forth in song. There the slave Juan Francisco Manzano (fl. 1890) won his freedom by his pen. Gabriel de la Concepción Valdés, another humble Negro, the author of *Siempre viva*, won laurels under the pseudonym of Plácido. Ramón Vélaz Herrera's tragedy of *Napoleón en Berlín*, the *Pasionarias* of Rafael M. Mendive, and the *Margaritas* of the unfortunate Francisco J. Blanchié may also be mentioned. Some of the odes of the Cuban José María Heredia, in particular *Al Niágara*, *A la noche*, *Al sol*, and *Versos escritos en una tempestad*, compare well with the best of Coleridge and Bryant. Turning to the continent one finds vigorous descriptive work in *La cena de Baltasar*, by Manuel Carpio (Mexico, d. 1860). In *La salida del sol*, by his compatriot Ignacio M. Altamirano, is description of a more placid kind. Altamirano is also the author of one of the best recent novels, *Clemencia*. The poems of Arnaldo Márquez and Clemente Althaus, of Peru, take very high rank for their beauty and tenderness of sentiment as well as purity of style. The *Noche de dolor en las montañas* and the *Canto de la vida* of the Peruvian Numa Pompilio Llona are compositions which will be admired for centuries. The *Flores del aire* of Dr. Adán Quiroga, of Argentina, is a collection of poems of great merit and originality. Compositions of remarkable beauty will be found in the *Brisas del mar* of the Peruvian Manuel Nicolás Corpancho, the *Lágrimas y recuerdos* of Doña Silveria Espinosa de Rendón, of Colombia, and the *Flores silvestres* of Francisco Javier de Acha, of Uruguay. José Batrés y Montúfar, of Guatemala, a lyric poet of merit, is one of the most noted satirists of

America. Matías Córdoba and García Goyena, of Guatemala, have been justly compared as fabulists to Æsop and La Fontaine.

Novelists and Dramatists.—The novels most widely known are the *Amalia* of José Mármol (Argentina); the *Maria* of Jorge Isaacs (Colombia); *La linterna mágica* of José T. de Cuellar (Mexico); *Alberto el jugador*, by Doña Rosario Orrego de Uribe (Chile); the historical novel *El Padre Orant*, by Narciso Aréstegui (Peru); and the sparkling romance of the Colombian Julio Arboleda, entitled *Casimiro el montañés*. The Mexican historian Orozco y Berra wrote a beautiful novel, *Escenas de treinta años*, relating the experiences of an unfortunate, disappointed invalid. Among the most powerful recent novels are the *Libro extraño* of Dr. Francisco Sicardi, of Argentina, and *Centra la marea*, by the Chilean Alberto del Solar.

Among noted dramatists of the century have been, in Mexico, Rodríguez Galván, author of the first national drama, Fernando Calderón, and Manuel E. Gorostiza, author of *Independencia para todos* and *Contigo pan y cebollas*; in Peru, Manuel Nicolás Corpancho and Manuel A. Segura; in Uruguay, Francisco J. Acha.

Two fine specimens of prose word-painting deserve mention here, namely, the description of the Falls of Tequendama, by the Colombian botanist Fran. Antonio Zea (1770-1822), and Simón Bolívar's *Delirio sobre el Chimborazo*.

Historians and Geographers.—Spanish America has been especially prolific of historians and writers of descriptive geographical works. The names of some of the most famous of these, with their principal works, are as follows: Rafael María Baralt (d. 1860), *Resumen de la historia antigua y moderna de Venezuela*; Lucas Alamán (d. 1853), *Historia de Méjico*, 5 vols.; José Manuel Restrepo, *Historia de la revolución de Colombia* (1827); José Antonio de Plaza, *Historia de la Nueva Granada*; Joaquín Acosta (d. 1852), *Viajes á las regiones ecuatoriales*; Manuel Orozco y Berra (d. 1885), *Historia antigua y de la conquista de Méjico* (4 vols.); Antonio García Cubas, *Diccionario geográfico, histórico y biográfico de los E.E. U.U. Mexicanos* (5 vols.); Manuel José Cortés, *Ensayo sobre la historia de Bolívar* (1861); Antonio de Alcedo (Ecuador, d. 1812), *Diccionario geográfico histórico de las Indias occidentales* (5 vols.); Miguel Lobo, *Historia general de las antiguas colonias hispano-americanas*; Pío Benigno Mesa, *Anales del Cuzco*; Miguel Luis and Gregorio Victor Amunátegui, *Los precursores de la independencia de Chile* (1872); Diego Barros Arana, *Historia de la independencia de Chile* (1870); Bartolomé Mitre, *Historia de Belgrano y de la independencia argentina* (3 vols.) and *Historia de San Martín y de la emancipación sud-americana* (4 vols.). Special mention should be given to Antonio Raimondi's great descriptive work, *El Perú*, which was cut short by the author's death in 1890, only four volumes and a part of the atlas having been published, and to the *Historia Argentina* of Mariano A. Pelliza, now in preparation, the fourth volume having been published in 1894.

AUTHORITIES.—*Lira Americana*, by R. Palma (Paris, 1865); *América Política* and the *Diccionario Biográfico Americano*, by Domingo Cortés (Paris, 1875); Francisco Largomaggiore, *América Literaria* (Buenos Ayres, 1883); Francisco Pimentel, *Historia crítica de la literatura y de las ciencias en Méjico*; J. M. Torres Caicedo, *Ensayos históricos y de crítica literaria sobre los principales publicistas y literatos de la América Latina*; Marcelino Menéndez y Pelayo, *Antología de poetas hispano-americanos* (3 vols., already published; Madrid, 1893-94); *Bocetos literarios de escritores argentinos*, by Martín García Merou (Buenos Ayres, 1892). García Merou's *Confidencias literarias* (1894), although treating principally of Argentine writers, devotes considerable space to the leading authors of other Spanish-American countries. MARATHON MONTROSE RAMSEY.

Spanish Armada: See ARMADA, THE SPANISH.

Spanish Fly: See CANTHARIS.

Spanish Fork: city (founded in 1851); Utah co., Utah: on the Spanish Fork river, and the Rio Grande W. and the Union Pac. railways; 12 miles S. by E. of Provo (for location, see map of Utah, ref. 4-M). It is a trading-point for a large agricultural region, and contains Lutheran, Mormon, and Presbyterian churches, ten public and denominational schools, an incorporated bank with capital of \$25,000, and a weekly newspaper. The battle of Diamond Creek was fought here on June 20, 1866. Pop. (1880) 2,304; (1890) 2,214; (1895) 3,576. EDITOR OF "SEN."

Spanish Grams: another name for *Esqueros* (q. v.).

Spanish Language: the national language of Spain and also of some other countries where it has been carried by colonists from Spain; as Mexico and the rest of Spanish America is called. In Spain itself certain regions are not properly included in the territory of the Spanish language; thus the dialect of Galicia belongs rather to Portuguese, and there is a small territory in the north where the language is Basque (see *Basques*), while Catalan is spoken in Catalonia, Valencia, and the Balearic islands. The dialect-forms of Spanish spoken in various parts of Spain have not yet been fully investigated, and the variations and peculiarities of American Spanish are not further study, though something has been done in this direction. (See the references below.) No exact approximate statement of the number of those whose native tongue is Spanish in some form or other is possible; for Spain itself estimates vary from less than 11,000,000 to 14,000,000.

The sounds of the standard or literary language may be approximately described as follows: There are five vowels only, *a, e, i, u, o*; *e* and *i* being intermediate between the close and open sounds of these letters in Italian, for instance. There are twenty-three (or twenty-four) consonants: *p, b* (written *b* and even *v*, *f*, *v* is bilabial *v*, written *b* or *v*); *t* is only as a result of elision that *b* and *v* are distinguished as written, so in consonantal *b*, written *b*, *v*, *t* of the last two more dental than in English), a voiceless spirant like *th* in English *there* (written *t*, or before *e* or *i*, *s*), sometimes even *d* in the singular, a voiced spirant like *th* in English *there* (written *d*, *z*, *z* two forms of *z*, one strongly bilabial (written *z*, *rr*), the other (written *z*) and *ss*, *s* more "refined" or "dental" than in English, *s* palatalized *z*, merely like *th* in English *outflow* (written *th*), a palatalized *s*, nearly like *ss* in English *union* (written *ss*), *y* (two forms of *y* are recognized by Araujo, one a consonantal *y*, written *y*, the other more like German *j*, written *j*); *k, g* (these two varying somewhat in sound according to the following vowel: written *x, g, m*, before *e* or *i*, *g* and *g* respectively), an aspiration resembling *sh* in German *sch* (written *j*, or, before *e* or *i*, sometimes *ch*), a voiced spirant (the voiced form of the German sound just mentioned, written *g*), and the sound of *ng* in English *long*, *ang* (written *ñ*). The voiced sound of *g*, namely *g*, occurs occasionally, but is not commonly recognized. An important consonant group is that written *ch*, with the sound of *ch* in English *church*. Noteworthy is the almost total lack of doubled consonants in Spanish words. The orthography, as regulated by the Academy, is a fairly good representation of the spoken language.

The pronunciation of modern Spanish is not the same as that of the older language, in which some sibilant sounds existed which have been lost. Thus *x* formerly had in popular words the sound it has in Portuguese, or that of *sh* in English *she* or French *sh*, but this has become the aspiration written *j* in *yo*; compare *Quixote*, formerly *Quixote*, with the French form *Quixote*, or English *sherry*, that is, wine of Xeres (now written *Jerez*). An initial *h*, now silent, often stands for older *f*.

The grammatical structure of the language is very similar to that of the other Romance languages. Certain peculiarities, especially of the neuter form (*lo*) of the article with adjectives, are noteworthy; *so, too*, are the frequent use of a proposition (*de*, "to") before the direct object of a verb, the distinction between the two words *ser* and *estar*, "to be," and that between *haber* and *tener*, "to have." The verb-tenses formed without the aid of separate auxiliary words are the same as in French, with the addition of a second conditional (also used as an imperfect subjunctive, and found in old Spanish in its original sense as a pluperfect indicative), and of a future subjunctive. Among the sources of the Spanish vocabulary, besides Latin, Greek, and old Germanic dialects (which, should be noticed especially the Arabic.

As in the case of the other Romance languages, there is no sharp line of division to be drawn between vulgar Latin and early Spanish, the latter being the vulgar Latin of Spain whose characteristics are so characteristic enough to have a new name. Traces of this vulgar speech are to be found in Latin documents as early as the eighth century, but distinctly Spanish facts are not preserved to us from an earlier time than the twelfth century. A Latin-Spanish dictionary (*Vocabulario vocabularum in latin y in romance*) by Palencia belongs to the year 1490, and in 1492 came the lexicon (*Latin-Spanish* and *Spanish-Latin*) and the grammar of *Isidoro* (Lectorius, Nabrius). Among the most noteworthy

early grammatical or lexicographical works are *Adreus, Del origen de la lengua castellana* (1598), and the etymological dictionary of Sebastian de Covarrubias Orozco (*Thesoro de la lengua castellana o española*, 1611). The Spanish Academy, established in 1713, published a *Diccionario de la lengua castellana*, 6 vols. (1726-39), condensed into one volume in 1780 (1825 ed. of this condensed form 1864). The Academy published in 1741 an *Orthographia española*, and in 1771 the first edition of the grammar. An outline of the historical grammar of the language is given by Rasis in Gröber's *Grundriss der romanischen Philologie*, 1. (1899), where many other references are given.

Spanish Literature: the literary productions of Spain, or the compositions in the Spanish language, whether by Spaniards or Spanish Americans. The latter application seems the more appropriate, but its two divisions are considered separately; the present article is confined to productions of the Iberian Peninsula in the language known as Spanish or Castilian,* while the literature of Spanish America is treated in a separate article.

Several circumstances tended to stamp the Spanish character with a distinct individuality. Long a favored Roman province, permeated by the language, the literature, and the religion cultivated in the later empire, Spain learned to look to Italy for support and guidance material, intellectual, and spiritual. Eight hundred years of war against an alien race with an Asiatic tongue and an infidel religion produced in the Spaniard a devotion to country and king and mother Church nowhere else to be found. The wars with the Moors, being largely a matter of border forays, encouraged personal prowess and a spirit of romantic adventure. It thus came about that the literature of Spain had three great sources—love, war, and religion.

Ballads and Songs.—As in other countries, the earliest essays at composition were songs, and ballads or tales in verse. Their most usual and seemingly oldest form is in lines of eight syllables, not divided into stanzas, but matching lines 2 and 4, 6 and 8, etc. These did not rhyme, but were measured—an easy compromise between rhythm and blank verse thought to be native and peculiar to Spanish. The style of these old ballads is extremely diversified; their tone is by turns devout, plaintive, gay, lightly satirical, or intensely heroic, according to the author and his subject, but without the coarse ferocity of the songs of the north. They were a spontaneous growth, preserved only by memory, chanted to simple music in social gatherings or by strolling singers. The first attempt at a printed collection of such

* There remains nothing in this language of a date known to be earlier than A. D. 1150. The Moors had then been in possession of the largest and best part of Spain for nearly two years.

songs was the *Cancionero General*, published in 1511. A later and more valuable collection, the *Romancero General*, was completed in 1614. Over 1,000 pieces have thus been rescued from oblivion. Many of them cluster around centers, partly historical, but largely imaginary. Twenty are devoted to Charlemagne and his peers, 50 gather around the name of Bernardo del Carpio, and 200 are songs of the Cid.

Epic Poetry.—The earliest Spanish epic is the *Poema del Cid*, which relates the adventures, real and imaginary, of the early hero Rodrigo (or Ruy) Díaz de Vivar. Although his death occurred as early as 1099, no portion of the poem is older than the twelfth century. It is without beginning, date, or name of author, and contains 8,744 assonant lines of fourteen syllables, more or less, arranged in quatrains. In its execution it is one of the finest productions of the Middle Ages. See Cid.

It is at least 350 years from the supposed date of the *Poema del Cid* to the next great outburst of the epic Muse, in the reign of Philip II. In 1560 Sempere published the *Carolea*, to glorify the victories of Charles V. Five years later appeared the *Carlo Famoso*, wherein Luis de Zapata celebrates the achievements of the same monarch in 5,000 prosy octave stanzas. Alonso de Ercilla y Zúñiga, courtier, soldier, and poet (d. 1596), wrote an epic, one-third longer than the *Iliad*, on the suppression of the Araucan Indians of Chile, in which he bore an active part. Portions of the poem are of great beauty, and its merit elicited praise even from Voltaire. Gabriel Laso de la Vega published *La Mexicana* (1594) in honor of the conquest of Mexico by Cortés; and five years later Antonio de Saavedra issued a romantic life of the conqueror in his *Pelegrino Indiano*. About the same time Juan de Castellanos composed a rhyming chronicle of the conquests in South America in some 90,000 lines, a narrative that strongly attracted the attention of Humboldt and Southey; and Juan de la Cueva (1603) produced the *Bética*, on the recapture of Seville from the Moors, in imitation of Tasso's *Jerusalem Delivered*.

Romances.—Besides epics resting on Spanish history, there were others having either no basis of fact or only a very remote one. All Europe swarmed for many centuries with marvelous recitals that gave rise to the modern words *romance* and *romantic*. The Scriptures, the lives of the saints, Greek and Roman antiquity, the legends of Charlemagne and of King Arthur, afforded inexhaustible material that was handled with the utmost disregard of proprieties of time and place; and peerless knights, giants, necromancers, dragons, and fair ladies imprisoned in enchanted castles were furnished regardless of cost. The earliest Spanish romance was the *Alexandro* of Juan Lorenzo Segura, priest of Astorga, in the second half of the thirteenth century. By far the most important and popular work of this class was the *Amadis de Gaula* (see AMADIS OF GAUL), conjectured to have been written in Portuguese about 1360. It was followed by an extensive aftergrowth of romances and *caballeros* (books of chivalry and knight-errantry) that became ever more fantastic and insipid, until put down by the strong but gentle hand of Cervantes.

In the pastoral romances that supplanted them fancy was not at such a high tension. The earliest of these in Spain was the *Diana Enamorada* of Montemayor (d. 1561)—an imitation of the *Arcadia* of Sannazaro, the Neapolitan. Later appeared the *Filida* of Gálvez de Montalvo, the *Galatea* of Cervantes, and the *Arcadia* of Lope de Vega.

But romance was destined to seek a still lower level. Diego Hurtado de Mendoza (1503-75), a member of one of the noblest families of Spain, and almost equally distinguished as soldier, statesman, scholar, poet, historian, and writer of fiction, chose a strange subject for a romance. His hero, *Lazarillo de Tormes* (Little Lazarus, Luke xvi. 20), was an outcast from his birth, and the guide of a blind beggar. His genius and assiduity secure promotion, until he reaches the height of roguish ambition as a kind of king among thieves. This was followed in 1599 by Mateo Alemán's similar story of *Guzmán de Alfarache*; and in 1626 appeared the exploits of the *Gran Tacaño Pablo de Segovia*, into which the author, Quevedo, put some of his most brilliant work. This style of literature became and remained popular. It had a foundation in real life, however low, and was called "picaresque" from *pícaro*, rogue. The *pícaro* was an intelligent scoundrel, and had the genial humor of the South that made him almost lovable. Out of the three kinds of fiction named has been developed the modern novel.

Rise of the Drama.—While the remains of the Greek and Roman theater had become so debasing that the Church

exerted all its power to suppress them, the advantage was seen as early as the fifth century of presenting something to catch the eyes and attention of its less educated members. Representations of the stable, the temptation, Gethsemane, the judgment-hall, and Calvary were given by servants of the churches and school-children. Scriptural readings and choral hymns were added. Buffoons were gradually introduced, and the devil and his imps were given humiliating positions. In time the devils and the fools became the favorite characters, and the Church had unwittingly created a comic theater of its own. A feeble attempt to keep these exhibitions within bounds was made in the code of Alfonso X. (1260). Still they kept growing in number and complexity, until in the seventeenth century, in the hands of Calderón, they became great allegorical sermons. In the meantime the worst of them had been turned into the streets, where they continued to be presented to the multitude. In 1492 appeared *La Celestina*, a book which in the U. S. would be excluded from the mails. Its merit lay in presenting live men and women—even though at their worst—instead of the allegorical figures to which the public had been accustomed. It was never acted nor intended to be acted, yet it had an immense popularity and a powerful effect in developing the drama. More than thirty editions were made of the work, at least seven translations, and a swarm of imitations.

The next important step was made by Juan de la Encina, musician, poet, and priest, who (1496-98) brought out eleven pieces, which show little of the playwright in their construction, but were really acted; hence their author is recognized as the founder of the Spanish stage. Bartolomé de Torres Naharro (1517) composed eight comedies in easy verse, and gave a more regular form to the drama, dividing it into five acts (*jornadas*), and prescribing sound regulations for maintaining consistency and truth to nature. But he gave little heed to his own rules, introducing allegorical and impossible persons and incidents. About 1553 Francisco de Avendaño wrote several plays of three acts. Lope de Rueda (d. 1567), a gold-beater of Seville, who turned actor and dramatist, wrote sixteen plays, and first introduced interludes (*entremeses* and *pasos*) between the acts. Juan de la Cueva, a poet of Seville (1579), adapted the great historical romances to the stage, and introduced the division into four *jornadas*.*

Religious and Historical Works.—As might be expected, there were from a very early period pieces in prose and verse intended for edification. The *Life of Saint Mary of Egypt*, the *Adoration of the Three Holy Kings*, and the *Danza General*, or Dance of Death, are so old as to be without known date or author. Then follow at irregular intervals *Miracles of the Virgin*, by Gonzalo de Berceo (1246); the *Caballería Celestial* of Hierónimo de San Pedro (1554); the *Monserate* of Virués (1581); the *Redención Universal*—30,000 lines—by Fran. Hern. Blasco (1584); and Diego de Hojeda's *Christiada* (1611). The excessive fondness for allegory, prevailing when these poems were written, makes them seem irreverent to modern readers. In the *Caballería*, Christ and Lucifer, as Spanish knights, with their followers, maintain a war with varying success from Bethlehem to Calvary. The *Christiada* covers the period from the Last Supper to the crucifixion. The whole is connected and well sustained, but disfigured by the symbolism which was exuberant in the Middle Ages.

Alfonso X. of Castile (1252-84), surnamed *el Sabio*, the most enlightened prince of the age, has been called the father of Spanish prose, although his part must have been chiefly to foster and direct. To him are due a translation of the Scriptures, *Libros de Astronomía* (containing the famous Alfonsine Tables), a *Lapidario*, a *Crónica General* or Universal History, *La Crónica ó Historia de España* down to his own time, and a great compendium of law still known and respected as the *Siete Partidas*. Other chronicles were written by Fernán Pérez de Guzmán, Diego Enríquez and Alonso de Palencia, Ambrosio de Morales, and Gerónimo Zurita. Fernando del Pulgar and Andrés Bernaldés recorded the reign of Ferdinand and Isabella. But these old chronicles merely narrate a succession of occurrences without logical connection. The first real historical work is the *Historia de España* by the Jesuit Juan de Mariana (1601). In his time Spain produced a galaxy of eminent historians. Among the most prominent works may be mentioned the

* All this time the exhibitions were given in gardens, courtyards, or the public streets, without scenery or costumes. The first theater for the reception of the public was opened in 1748.

Guerra de Granada of Hernando de Mendoza (1603); the *Historia de las Indias* of Herrera, as well as that of Bartolomé de las Casas; Mendoza's *Relación de las Indias* (1605); Meléndez Valdés's *Guerra de Cataluña* (1645); and the magnificent work of Antonio Solís, the *Conquista de México*.

Lope's poetry, especially that of the highest order, was much indebted to Italian models. Lope López de Mendoza, Marquis of Santillana (d. 1459), had an extensive acquaintance with the literature of Provence and Italy, and was largely influenced by their masterpieces. Most of his writings were infused with the learned conceits of the court and the Italian school; yet when he stepped to the free air of the mountains, nothing could surpass the sweet grace of his songs. His *Sorrenilla*, or the *Millennium of Fingona*, is often given as a beautiful example, and may be found in *Second's Literature of the South of Europe*, II, 162. The epic cycle described the love and esteem of his country as much for his encouragement to men of letters as for his own productions. Juan de Mena (d. 1456), one of his disciples, was court historian to John II, and a sort of poet-laureate. After a follower of Italian models, he did much to improve the Castilian language by enlarging its vocabulary and perfecting literary style.

Garcilaso de la Vega (d. 1526), descended from the Cid, and Juan Boscán (d. 1540) were the introducers of blank verse, and in their time the pillars of the Italian school. Francisco Castellón (d. 1556), author of short poems, religious, pastoral, and satirical, opened the growing fashion with patriotic zeal. Two poets, Luis Ponce (Fr. Luis de León) and Fernando de Herrera (d. 1597), were lyric poets of the first rank. Fray Luis held ideas too advanced, and had to seek refuge in song from the consequent persecution. Herrera's principal poems were a triumphal ode on the battle of Lepanto and an elegy on the defeat and death of Sebastian of Portugal. Luis de Góngora (d. 1627) did so much to promote the growing pedantic style that it took the name of Góngorism. At first simple and natural, he became the most stilted writer of his day. His stanzas became so intricate and full of strange words and meanings, metaphors, and obscure allusions, that a lexicon of 1,500 pages was compiled as a key to them. His style was imitated in the translations, satires, and other short poems of Francisco Gómez de Quevedo (d. 1645).

The classic era—1550 to 1650 approximately—produced writers more numerous and more distinguished than any equal period before or immediately after. A fair idea of their numbers may be gained from the long lists given by Cervantes in his *Galatea* and *Vida de Cervantes*, and by Lope de Vega in his *Laurel de Apolo*.

Don Quixote de la Mancha (1605), the classic work of Miguel de Cervantes Saavedra (see CERVANTES-SAAVEDRA and NOVELS), marks the central point of the golden era, as it is often called. *El Quixote* (as the Spaniards call the work) was brought out in two parts, the second appearing in 1615. Cervantes also wrote twelve *Novelas Ejemplares* (model novels), *Vida de Cervantes*, and a number of plays, of which few were successful. Cervantes's work was better appreciated after his death, for it soon was considered the perfection of Spanish style. His writings had almost the effect of checking originality of expression, and for many centuries Spanish writers hesitated to say anything in a way not authorized by him. Gregorio García, in his *Fundamentos del vigor y elegancia de la lengua castellana* (1790) draws 65 per cent. of his examples from Cervantes.

Lope Félix de Vega Carpio, the contemporary of Cervantes and his junior by fifteen years, far surpassed him in popularity. He wrote 2,300 dramatic pieces, large and small, and an incredible number of other poems. His productions took every form of which poetry is capable—by turns solemn, severe, musing, and frivolous. Luis Vélez de Guevara (d. 1644), a disciple of Lope, was a favorite both with the court and with the public. Of his 400 plays a few of great power remain. Juan Pírrica de Montalbán (d. 1625), a follower and biographer of Lope, wrote about fifty dramatic pieces, of which his tragedy *Los amantes de Teruel* has remained longest in favor.

The excellent comedies of Gabriel Téllez (d. 1648), better known as Tiro de Molina, and Ruiz de Alarcón (d. 1639) are still admired. Pedro Calderón de la Barca (d. 1681) was one of the most prolific and admired writers of Spain, and, after Cervantes, the one best known abroad. Among the mass of matter that circulated under his name, he admitted 113 full dramas and seventy sacramental plays as genuine, his comedies being generally cast in high life, he made

much turn upon "the point of honor." He was the first to give prominence to the profession of the professional comedian, who needed to be a rogue and a wit. He and Lope controlled the theater ninety years.

Decline of Literature.—Toward the middle of the seventeenth century literary activity began to decline, and the period from 1650 to 1750 is almost a blank. The last youth of Spain had been drawn away to colonize America or wasted in fruitless foreign wars. The country was exhausted by insurrections, civil strife, and the War of Succession, while the censorship of the press by Church and state was fatal to all freedom of thought. Philip V., the first Bourbon king of Spain, coming fresh from the brilliant court of his grandfather Louis XIV., not about reviving the literary spirit, and in that end established (1714) the Royal Spanish Academy, after the model of that of France. But the influence of Philip and his court was essentially French, and the old Spanish literature had been too seriously blighted to revive rapidly, so that nothing of importance was effected during the forty-six years of Philip's reign except the inception of the Academy's dictionary. Benito Feijóo, a quiet, laborious monk, had heard of Galileo, Bacon, and Newton, and what the outside world was thinking of, and between 1726 and 1790 published thirteen volumes entitled *Teatro crítico* and *Cartas Eruditas*, which did much to advance the intellectual life of his time. Ignacio de Luzán (d. 1754), a disciple of Boileau and an advocate of the French doctrines, wrote an *Arte Poética* based on them. Padre Isla (d. 1781) wrote a satirical romance, *Fr. Gerundio*, which had an immense popularity, and translated the *Ill Blaz* of Le Sage into Spanish. Nicolás Fernández Moratín (d. 1780) was the author of a small volume of minor poems and two long narrative poems, one, entitled *Diana*, on the chase, and the other on the burning of the ships by Cortés. The last is the finest epic which Spain produced during the century. His *Hermetismo* was the first original drama, according to the principles of Corneille and Racine, admitted in the Spanish stage. José Cadalso (d. 1782) was the author of *Morales Letters* in imitation of Montaigne and Marivaux; also of a satire on the still favorite system of acquiring all knowledge by a few easy lessons. Tomás de Iriarte (d. 1791) issued a little volume exposing the prevailing faults and follies in eighty fables, written with great ingenuity and elegance in half as many kinds of verse. Literature began gradually to revive; and in 1780 the young poet Meléndez Valdés obtained a prize from the Spanish Academy for a most original and delightful eclogue. All his lyric and pastoral poems show a true poetic spirit. Ramón de la Cruz produced (1765-95) a number of clever, short farce-comedies, and Ignacio González Castille (d. 1800) left about thirty plays, all in a vein of light and graceful satire.

Literature of the Nineteenth Century.—From 1780 to 1874 foreign domination, invasion, civil war, and the rapid alteration of hostile parties maintained a state of continual unrest. Interests of Spain, of France, and of Great Britain, claims of royal houses, of the Church, and of the rights of man were thearring elements. Men of liberal sentiments, if timid, were silent; if outspoken, were imprisoned or exiled. The long roll of those persecuted contains the names of many of the brightest lights of the age: Meléndez Valdés, mentioned above, and his disciple Nicols Álvarez de Cienfuegos; Gaspar Melcher de Jovellanos, philosopher and poet, whose writings stand pre-eminent for purity of style and beauty of diction; Manuel José Quintana and Leandro Fernández Moratín, whose lyrics and comedies are still among the most popular; José Antonio Conde, the distinguished Orientalist, author of *Historia de la dominación de los Arabes en España*; Raia de Saravia, Conde de Toranzo, the celebrated historian; Fr. Martínez de la Rosa, poet and dramatist; Ángel de Saavedra, Duque de Rivas, lyric poet and romanticist; and José de Espronceda, who has been called the Byron of Spain. Yet the reviving literature steadily gathered strength, and every year saw new authors established in public favor.

Three well-known critics of contemporary literature, Mariano José de Larra (1809-37), Ramón Mesonero Romanos (1803-82), and Serafín Estébanes Calderín (1799-1867), who wrote under the respective pseudonyms of *Figaro*, *El Cuchino*, *Pariente*, and *El Solitario*, were to Spanish manners and customs what *The Spectator* had been to those of England. The most prominent dramatists belonging to the first generation of the century were Juan Eugenio Hartzenbusch (1800-50) and Antonio Gil y Zárate (1796-1861), who were followed by Manuel Tamayo y Raus (b. 1820) and Adelardo López de

Ayala (1828-70). Manuel Bretón de los Herreros (1796-1873) was foremost among writers of comedies. His numerous plays were ably devised, well written, and full of life and gaiety, and many of them are as popular to-day as when first presented. The great literary critics were Alberto Lista (1775-1848), Agustín Durán (1798-1862), Hartzenbusch, and Eugenio de Ochoa (1815-72). Cecilia Böhl de Faber (1796-1877), better known as Fernán Caballero, a woman of extraordinary capacity for seeing, grouping, and delineating real life, was the founder of the modern realistic novel. Gertrudis Gómez de Avellaneda (1816-73), whose writings exhibit every phase of woman's love and sorrow and religious feeling, is reckoned the most brilliant poetess in Spanish literature. Nearly all Spanish authors wrote more or less poetry; but of those who were essentially poets may be named Ventura de la Vega (1807-65) and Gaspar Núñez de Arce (b. 1834), dramatists and lyric poets, José Selgas (1824-82), poet of rural life and scenes, José Zorrilla (b. 1817), who sang of Spain's departed grandeur, and Ramón de Campoamor (b. 1817), the poet philosopher.

With the quiet and prosperity which the termination of the Carlist wars brought to Spain in 1876 came a period of enlightenment as great as that enjoyed by any other country of Europe. The spirit of progress is nowhere more evident than in the domain of letters. In every class of composition there are works of genuine talent, but the subjects in which contemporary Spanish literature chiefly excels are history, criticism, and fiction. Two political leaders, Emilio Castelar (b. 1832), the most eloquent speaker of the present day, and Antonio Cánovas del Castillo (b. 1830) are both eminent historians. Cánovas is moreover an able critic, as are also Juan Valera, the diplomat and novelist, and Emilia Pardo Bazán, the de Staël of modern Spain; but the most brilliant genius in the domain of literary criticism and history is Marcelino Menéndez y Pelayo (b. 1856), whose elegance of style and thoroughness of research have seldom been equaled. In Spain, as in the U. S., the novel is the principal feature of literature as distinguished from science. There too it has attained a high development, and is the chief agency in advancing the public sentiment. Spanish novels are second only to English; among the best-known are those of Pedro Antonio de Alarcón (1833-91), José María de Pereda (b. 1834), Juan Valera (b. 1837), Benito Pérez Galdós (b. 1845), Armando Palacio Valdés (b. 1831), and Doña Emilia Pardo Bazán (b. 1851), and the short stories of Antonio de Trueba (1819-89).

AUTHORITIES.—The American reader who is not a specialist will require nothing more before the nineteenth century than Tucknor's *History of Spanish Literature* (New York, 1849, 3 vols.; 4th ed. Boston, 1872, 3 vols.). Some additions have been made in the Spanish translation (Madrid, 1851-56) and the German (Leipzig, 1852-67). For the nineteenth century, Francisco Blanco García's *Literatura Española en el Siglo XIX* (2 vols., Madrid, 1891); *Literatura españolas del Siglo XIX* of Juan P. Criado y Domínguez; and the *Historia de la Literatura Española* of Manuel de la Revilla and Pedro de Alcántara may be consulted.

MARATHON MONTROSE RAMSEY.

Spanish Mackerel: either of two scombroid fishes. (1) Along the eastern coast of North America, *Scomberomorus maculatus*, a very slender, compressed fish, bluish-green above, satin-like white below, with yellowish spots on the back and sides, and with the first dorsal fin blackish before and along its margin. It attains a length of 2½ feet. It is a native of the tropical seas, but ranges from Southern Brazil to Cape Cod, and is one of the most esteemed of salt-water fishes. (2) In Europe, *Scomber colias*, distinguished externally from the common mackerel (*Scomber scombrus*) by the larger eye and the diminished number of wavy streaks. It is known in the U. S. as the chub-mackerel and the thimble-eye.

Spanish Main: an old term still occasionally used for those portions of South and Central America which border on the Caribbean Sea, i. e. the modern Venezuela, Colombia, and the Central American states. The original Spanish term, *Tierra Firme*, included only the coasts from the mouth of the Orinoco to Costa Rica. Some writers erroneously use the name for the Caribbean Sea. H. H. S.

Spanish War of Succession: See SUCCESSION WARS.

Span-worm, or Measuring-worm: the larva of any geometrid moth; so called from the elevation of its body in locomotion, as if measuring. The CANKER-WORM (*q. v.*) is an example.

Spar: in mineralogy, a term used vaguely for several crystalline minerals of nonmetallic luster and smooth cleavage. See BARYTA, CALCAREOUS SPAR, FELDSPAR, and FLUOR-SPAR.

Spar'idae [Mod. Lat., named from *Spar'us*, the typical genus, from Gr. *σῆδος*, a kind of fish, the gilt-head]: a family of acanthopterygian fishes, comprising the porgy, sheepshead, and related forms. The body is compressed and oblong; the scales have obsoletely pectinated margins and striae diagonally crossing the surfaces and meeting the sides at acute angles; lateral line continuous to the caudal fin; head compressed; mouth terminal, with an oblique lateral cleft; upper jaw moderately protractile, and with the supramaxillaries partly sliding under the preorbital bones; teeth in the jaws either developed on the sides as molars, or in front as more or less defined incisors, or of both kinds; dorsal fin elongated, with its spinous portion rather longer than the soft, and folding in a dorsal groove; anal with three spines; caudal fin with pointed lobes; pectoral fin pointed and with the rays branched; ventrals thoracic, each with a spine and five branched rays, and with pointed axillary scales. The family is well represented in all warm and temperate seas. There is a considerable range of variation in dentition and squamation, as well as in osteological characters. No typical sparoids have yet been detected along the Pacific coast of the U. S. See SHEEPSHEAD.

Revised by F. A. LUCAS.

Spark, Electric: See ELECTRIC DISCHARGE.

Sparks, JARED, LL. D.: historian; b. at Willington, Conn., May 10, 1789; graduated at Harvard 1815; was mathematical tutor there 1817-19, studying theology meanwhile; became pastor of a Unitarian church at Baltimore, Md., May, 1819; was chosen chaplain to the U. S. House of Representatives 1821; conducted at Baltimore a periodical, *The Unitarian Miscellany*, 1821-23; retired from the ministry on account of ill health, and removed to Boston 1823; purchased *The North American Review*, of which he was sole editor until 1830; visited Europe 1828; spent considerable time in examining the English and French archives for materials of American history; founded in 1830 *The American Almanac*; edited for the U. S. Government *The Diplomatic Correspondence of the American Revolution* (12 vols., 1829-30); published *The Writings of George Washington, with a Life of the Author* (12 vols., 1834-37); *The Life of Gouverneur Morris* (8 vols., 1832); conducted two series of a valuable *Library of American Biography* (1st series, 10 vols., 1834-38; 2d series, 15 vols., 1844-48), for which he wrote several of the lives; edited *The Works of Benjamin Franklin, with Notes and a Life of the Author* (10 vols., 1836-40), and *The Correspondence of the American Revolution* (4 vols., 1854); published two or three controversial pamphlets in defense of his editorial conduct in correcting Washington's orthography and grammar, and upon other similar topics, besides a number of works on religious subjects. Dr. Sparks was McLean Professor of History at Harvard 1839-49, and president of that institution 1849-53. D. at Cambridge, Mass., Mar. 14, 1866. See the *Memoir* by Rev. George E. Ellis, D. D. (Cambridge, 1869).

Sparrow [M. Eng. *sparwe* < O. Eng. *spearwa*; O. H. Germ. *sparo* (> Mod. Germ. *sperling*); Goth. *sparwa*]: any one of various birds of the family *Fringillidae*. The term is generally applied to those *Fringillidae* with a streaked plumage in which some shade of brown or chestnut predominates. The most familiar species is *Passer domesticus*, called in the U. S. English sparrow, from the country whence it was introduced, and more correctly known in Great Britain as the house-sparrow. It is too well known to need a description. Its original habitat was the greater part of Europe and temperate Asia and Northern Africa. The English sparrow was introduced into the U. S. in the fall of 1850, when Nicolas Pike and other directors of the Brooklyn Institute imported eight pairs. These did not thrive, but others were brought over in 1852 and at numerous subsequent dates, and by the end of 1886 the sparrow had spread over the greater portion of the U. S. E. of the Mississippi and N. of Florida, and extended in the northwestern portion of its range into Iowa and Minnesota and beyond the Missouri. It was also abundant about San Francisco, Salt Lake City, and New Orleans, while there were many scattered colonies beyond the frontiers of its domain. Since then it has steadily spread, but exactly how much territory it covers is not definitely known. The sparrow has also been introduced by thoughtless individuals

into Australia, New Zealand, and the Hawaiian Islands where, as in the U. S., it has multiplied and become a pest. Evidence is overwhelming against the sparrow. It is considered as being destructive to natural crops, of crowding out native birds by selling their food and occupying their nesting places, and also of actually driving them away. It is particularly harmful to grain, grapes, peaches, and pears, while the number of injurious insects destroyed by it is trivial. Its phenomenal increase is largely due to its fecundity, as a pair of sparrows raise on an average three or four broods a season, and may, under favorable circumstances, raise as many as six, each brood numbering four or five.

In New Zealand and the Hawaiian Islands the injurious effect of the sparrow on the native bird fauna is particularly obvious and regrettable.

The American sparrows have a more slender bill than the introduced species, *see The English Sparrow in North America*, a Bulletin of the Department of Agriculture (Washington, 1899). P. A. LARSEN.

Sparrow, Abner (bishop; b. at Hoxton, Suffolk, England, in the beginning of the seventeenth century; was a fellow of Queen's College, Cambridge, but was ejected in 1661 for refusing to sign the Covenant. Sent after he became pastor of Hoxton, but in five weeks was ejected for reading the Book of Common Prayer. He was restored in 1660, and was made Bishop of Exeter in 1662 and of Norwich in 1676. D. at Norwich in 1685. He published *A Rational and Practical Exposition of the Book of Common Prayer of the Church of England* (London, 1649). It has been often reprinted, the last time in 1902. The seventh edition (1722) first contained the celebrated *Letter of the Compiler of the Liturgy, and an Historical Account of its several Revisions*, by Samuel Davies, a work which forms the true source of much of the English liturgical learning that has since been put forth. He also published *A Collection of Articles, Instructions, Canons, Orders, Decisions, and Constitutions Ecclesiastical, with other Public Records of the Church of England, chiefly in the Times of Edward VI., Elizabeth, James I., and Charles I.* (London, 1601; often reprinted; last edition that of 1684); also *Constitution of the Church, and the Power of Absolution, Authority of the Church, and other works*. Revised by W. S. PIERCE.

Sparrowhawk: any one of several small species of the genus *Falco*. They have two primaries margined along their inner webs, the second to third longest, and the first shorter than the fourth; the tarsus longer than the middle toe; and the basal joints of the toes provided with transverse serrations; the color of the sexes is very different at all ages, but the old and young of each sex are alike. The common American species is *Falco (Tymnestes) sparverius*. Its diagnostic characteristics are the bluish crown (with or without a patch of rufous), whitish front and auriculars, conspicuous "moustache" across the cheeks, the rufous back, the white or whitish abdomen, and the barring of the inner webs of the primaries with white and dusky; in the male the upper part of the head, as well as wings, is ashy blue or slate-colored, the scapulars, back, rump, and tail rufous; the primaries, secondaries at their basal halves, and broad subterminal band of tail, black; in the female the head is bluish above, but the bluish on other parts is replaced by rufous, which is barred by blackish. Its length is about a foot. The species is an inhabitant of North as well as South America, but is divided by Ridgway into five subspecies or races, limited in various countries; the only U. S. form is the typical *sparverius*, and this is found from the subarctic regions to the Isthmus of Panama. It preys upon small birds as well as mice and reptiles. It may be frequently seen perched on the top of a tree nearly erect and motionless, surveying the country around. It breeds in the northern parts of the U. S., as well as farther S., and selects for its nest a hollow tree, in which it lays five to seven dark orange-colored, nearly spherical eggs. It is one of the most useful of the small hawks, feeding upon insects, and particularly grasshoppers, whenever they can be obtained.

Revised by P. A. LARSEN.

Sparrow's Point: town; Baltimore co., Md.; on the Patuxent river, and the Northern Central Railway; 10 miles S. E. of Baltimore (for location, see map of Maryland, ref. 2-E). It contains four churches, large Y. M. C. A. building, the largest public school in the county outside of Baltimore, and a weekly newspaper. The Maryland Steel Company began to build a town here in 1897, as a part of the plant of the Pennsylvania Steel Company, of Mead-

Pg.; the enterprise was reorganized in 1902 under the name of the Maryland Steel Company; and in 1906 it had become one of the most prosperous steel-manufacturing places in the U. S. The town has iron-ferrous, mill, foundry, machine-shops, and an extensive plant for ship-building. Pop. (1890) 2,207; (1905) estimated, 2,800.

JAMES PHAIDY, Ph. D., SURVEYOR OF "TOWNS."

Sparta (= Lat. = Gr. Σπάρτα, Sparta, Lacedaemon) in antiquity, the capital of Lacedaemon and chief city of the Peloponnese. The Greek name of the city signifies acety land (*σπάρτα*, see 58). It is true that the city did not stand upon rocky heights, as was the case with nearly all Hellenic towns, but upon a group of hills which are seen on the right bank of the Eurotas, an hour's journey E. of Midea, at the spot where now stands a new Sparta (see map of Greece, ref. 17-K). The first glance at the surroundings makes it clear that the springing up of a city in this place was only accidental; it was the camp of the Dorians, who, coming from the N., gained a firm foothold first on this spot, while the Achaean still held possession of the strongholds and cities of the land.

The appearance of Sparta was different from all other Hellenic cities. The situation had nothing imposing in it. The small hilly undulations by the Eurotas vanish in face of the enormous rocky walls of Taygetus, which rise steeply from the plain to a height of 7,500 feet. No monuments exist which characterize the majesty of Helos. The whole locality gives only the impression of rural grace, and the prophetic words of Thucydides (II, 10) have been literally fulfilled, that in contrast to Athens, Sparta's ruins would give no sign of the former greatness of the city. Yet the historic character of Sparta is to be plainly seen in all the surroundings. The old city never confined itself within narrow walls; the citizens dwelt beside each other, as it were, in the open country. The canals, whose ditches are seen extending diagonally over the site of the old city, watered the gardens and plantations; there was no distinction between town and country. The laws of Lycurgus forbade the luxury of municipal architecture; even the dwellings of the kings preserved a patriarchal simplicity. The city, as it became powerful, was filled with votive offerings to the gods, especially with tripods, but the sacred center of the land was not Sparta, but the Amyklon. In Sparta also, after the Persian wars, a more imposing style of architecture was introduced, as is shown by the Persian porch, but the more Athens took the lead in the arts, so much the more remained Sparta behind, and even Lycurgus's victories brought the city no new adornments. It only lost more and more its old Doric character; the dwindling numbers of the citizens drew closer together; they themselves were no longer a sufficient protection; ditches and intrenchments were constructed against Demetrius (296), and against Pyrrhus (279), and at last the city was inclosed with a wall, the extent of which Polybius gives as 48 stadia (IX, 21). As Polybius says that Sparta within this circuit was much larger than Megalopolis within its wall of 50 stadia, the conclusion is that the wall had a circular form and the city a dense population. The wall was a symptom of degeneration and loss of freedom (Livy, xxxix, 47); under the tyrant Nabis it did not inclose the town completely, but only protected the open sides. It was restored after the capture of the city under Philippos, and remained under the Romans, under whom away Sparta was one of the most populous and prosperous cities of the peninsula.

As Sparta was never destroyed in antiquity, and was uninhabited in the Middle Ages, it is reasonable to suppose that many antiquities are buried in the deep soil. Very remarkable reliefs of the old style have come to light; especially worthy of mention is the two-sided pedestal with the reliefs, published in the *Annali del Instituto* (1861, xxx, 422, C), and the relief with Dionysos and Ariadne (1870, p. 272). Since the foundation of the kingdom of Greece the capital city of the Korinth valley is no longer Midea, situated near Taygetus, but has been removed again to the Eurotas, and new Sparta spreads itself out on the hills of the old city. See Crosby's article on *The Topography of Sparta in The American Journal of Archaeology* (1893, p. 35) (3). See also GRUNGE, *History of Arcadia*. EUGENE CUNY.

Revised by J. D. S. CREANORE.

Sparta: city; Randolph co., Ill.; on the Central and Chicago and the Mobile and Ohio railways; 20 miles N. by E. of Chester, the county-seat, and 50 miles S. E. of St. Louis

(for location, see map of Illinois, ref. 10-D). It is the center of a natural-gas region, and contains a woolen-mill, cannery, plow-factory, creameries, an incorporated bank with capital of \$25,000, a private bank, and a weekly newspaper. Pop. (1880) 1,754; (1890) 1,979.

Sparta: city; capital of Monroe co., Wis.; on the La Crosse river, and the Chi. and N. W. and the Chi., Mil. and St. P. railways; 25 miles N. by E. of La Crosse (for location, see map of Wisconsin, ref. 6-C). It is in an agricultural and fruit-growing region; is a popular summer resort; and contains medicinal artesian wells, free public library, high school, paper-mills, planing-mills, and flour-mills, carriage-factories, machine-shops, 2 State banks with combined capital of \$40,000, and 3 weekly newspapers. Pop. (1880) 2,387; (1890) 2,795. EDITOR OF "HERALD."

Spartacus: leader of the slaves in the Servile war (73-71 B. C.); b. in Thrace; was at first a shepherd and afterward chief of a gang of robbers, but was captured by the Romans, sold as a slave, and trained as a gladiator in a school at Capua. By showing how much better it would be to die in an attempt at freedom than to be butchered in the arena for a Roman holiday, he succeeded in forming a conspiracy among the pupils of the schools. Seventy of the conspirators, headed by Spartacus, fought their way out of Capua and took refuge in the crater of Vesuvius. Here they were soon joined by numbers of runaway slaves; an organization was accomplished; Spartacus was chosen leader, and formidable predatory expeditions were undertaken against the neighboring towns. C. Claudius Pulcher was then sent against them with an army of 3,000 men and blockaded them in the crater, but his force was suddenly attacked in the rear and almost annihilated. After this success the insignificant mutiny of a few slaves rapidly grew into a formidable war. The peculiar state of affairs in Southern Italy contributed much to this result. The soil of that region was almost exclusively owned or leased in large allotments by the Roman nobles, whose estates were cultivated by a numerous slave population, which lived in the most abject condition. Spartacus proclaimed the abolition of slavery, and before long he was at the head of an army of 70,000 men. His plan was to force the passes of the Alps, lead his army out of Italy, and then send every man to his home. With a victorious army of about 100,000 men he passed by Rome, and penetrated into the regions of the Po, where he was met by two consular armies. He defeated and routed them both, and at the funeral games which he celebrated in honor of Crixus he compelled the Roman knights among his prisoners to fight as gladiators in the arena. Unable to induce his soldiers to follow him out of Italy, he marched S. and went into winter quarters in Thurii. The defection of some of his troops and dissensions in his camp led to his defeat by Crassus. He then tried to cross over to Sicily, but was betrayed by the Cilician pirates who had agreed to transport his forces. A part of his army fell into the hands of Crassus, but Spartacus and the remainder of his troops effected their escape. Lucullus was now recalled from the East, Pompey from the West. After new victories, Spartacus went to Brundisium with the purpose of seizing the shipping in the harbor and crossing over to Thrace. Falling in with the army of Crassus, near the source of the river Silarus, he was defeated and slain. The fugitives were hunted down and slaughtered, and the revolt was completely suppressed. Revised by F. M. COLBY.

Spartanburg: city; capital of Spartanburg co., S. C.; on the Port Royal and W. Car. and the Southern railways; 73 miles W. S. W. of Charlotte, N. C., 93 miles N. W. of Columbia, the State capital (for location, see map of South Carolina, ref. 4-C). It is in a gold and iron mining and limestone-quarrying region; is the seat of Wofford College (Methodist Episcopal, established in 1853); and contains a high school, a national bank with capital of \$100,000, 2 State banks with combined capital of \$150,000, and a daily, a semi-weekly, and 3 weekly newspapers. Pop. (1880) 3,253; (1890) 5,544.

Spartianus Aelius: See AUGUSTAN HISTORY.

Spasm [from Gr. *σπασμός*, *σπασμα*, spasm, derivs. of *σπᾶν*, draw, draw apart, pull, rend]: sudden and involuntary muscular contraction. The relaxation and tension of muscular tissue are dependent on nerve-force. Spasm of muscle may result from disturbance of the nerve-centers, from peripheral irritation of the affected part, or from irritation of other organs or surfaces reflected from the nerve-centers.

When spasmodic rigidity is persistent for any length of time it is termed *tonic* spasm. Such is the period of rigidity at the beginning of the epileptic attack and the prolonged rigidity of tetanus and cerebro-spinal meningitis. When spasm is brief and recurs rapidly, it is termed *clonic* spasm. Such are the intermitting and repeated muscular contractions following the inception of the true epileptic attack, and constituting the more ordinary epileptiform attacks or "fits" of children. The graver spasmodic diseases are true epilepsy; epileptiform attacks from many causes, as indigestion and worms in children, renal disease in adults, and in the course of severe acute diseases, narcotic poisoning, etc.; chorea or St. Vitus's dance; tetanus; hydrophobia. Many lesser and local states of spasm frequently occur. Sneezing and coughing are spasmodic contractions of the respiratory tracts excited by irritation of the nasal or bronchial mucous membrane. Asthma is spasmodic constriction of many bronchial tubes, producing dyspnoea. Whooping-cough unites extreme hyperæsthesia and spasm of the bronchi with spasmodic constriction of the larynx. Intestinal colic and cholera morbus are conditions of painful spasmodic constriction of the intestines, due to cold or bad diet. In invalids and persons of sensitive nervous system painful spasms of various internal and external parts may develop suddenly from unknown or trivial exciting causes. The immediate relief of spasm is secured by so-called anti-spasmodics or nervines, as valerian, musk, camphor; by anæsthetics, narcotics, and sedatives, as potassium bromide, hyoscyamus, belladonna, opium. The permanent cure, when attainable, follows the correction of known causes. Revised by W. PEPPER.

Spatan'gidae: See ECHINOIDEA.

Spathe [from Lat. *spatha* = Gr. *σπάθη*, any broad flat blade, spatula, stem of a palm-leaf, broadsword, whence (viâ Lat. and O. Eng.) Eng. *spade*]: the single sheathing bract which incloses a cluster of one or more flowers in many species of monocotyledonous plants. Sometimes the inclosed flowers are arranged on a spike of the form called *spadix* (*σπάδιξ*), and in numerous palms the spadix is branching, and besides the principal spathe there are numerous secondary ones on the spadix. Revised by C. E. BESSEY.

Spaulding, LEVI: missionary; b. at Jaffrey, N. H., Aug. 22, 1791; graduated at Dartmouth College 1815 and at Andover 1818; went to Jaffna, Ceylon, as a missionary of the American Board; remained on that island fifty-three years, during which time he made but one visit to the U. S. (1844); superintended a boarding-school for girls at Uduville; prepared tracts, hymns, and school-books in the Tamil language, into which he translated several religious works; prepared (with Rev. J. Knight) a *Tamil Dictionary* (Madras, 1844), and issued a revised translation of the Bible. D. in Ceylon, June 18, 1873.

Spaulding, SOLOMON: clergyman; b. at Ashford, Conn., in 1761; was a soldier in the war of the Revolution; graduated at Dartmouth College 1785; became a Congregational minister in Connecticut 1787; settled in Ohio some years later, and while residing at Salem in that State about 1812 wrote a novel entitled *The Manuscript Found*, suggested by the opening of an Indian mound. It is claimed that this fiction became known to Sidney Rigdon at Pittsburg in 1814, and that it was the origin of the *Book of Mormon*. D. at Amity, Pa., Oct. 20, 1816.

Spa'vin [M. Eng. *spareyne*, from O. Fr. *esparvain* > Fr. *éparvin*, spavin]: certain swellings upon the hock-joint of the horse. In bog spavin the swellings and lameness are due to undue secretion of synovia (the lubricating fluid of joints). The most successful treatment is entire rest, with frequent bathing of the parts with cold water, and bandaging, accompanied by firm pressure upon the swelling, secured by means of compresses or spring trusses. Bone spavin, or spavin proper, is bony enlargement (exostosis) of the hock-joint, usually beginning at the lower part of the joint on the inside, and involving the heads of the splint and cannon bones, and of the small bones with which they articulate. It causes lameness, observable even in the early stages, and an imperfect action of the joint, gradually growing worse until finally the various bones become to a great extent united and solidified by the mass of fibrous bone which grows over them. The disease is caused by strains, to which the hock is particularly subject in work-horses drawing heavy loads, especially when starting them, and in race-horses and saddle-horses accustomed

Lo Insuring. When taken early, rest and counter-irritants will effect a cure; but when a considerable growth of bone has taken place, no absorption sufficient to cause a permanent cure can be expected, although active, sedative, or drying may cause an absorption of the bony excrescences, or even of the contiguous bone in some patients. The common course is an attempt to cure a spavined horse, when the disease is taken early, is to turn the animal out to grass, or otherwise regulate his diet so that his food shall be nutritious, yet cooling and laxative. At the same time the spavin may be treated for a week daily with salt and rhubarb, and then a blistering salve of solids of mercury rubbed in. The salve may be applied once in three or four days, and each time the strength and frequency of the application should be graduated according to the amount of excitement produced in the skin, avoiding any considerable blistering, but maintaining irritation upon the surface. After several applications, the spavin may be let alone until all heat and evidence of excitement in the skin have gone down, and the treatment then renewed. When not taken at its earliest stages, entire rest to the stall will promote a solid union (ankylosis) of the bones affected, and cooling lotions, salt and vinegar and liniment of potassium in solution in water, with attention to diet, will reduce the swelling of the contiguous parts, which is often comfortable. Thus after a while the horse will be able to labor with little or no pain, but with more or less stiffness of the joint. Though caused by strain and overwork, spavin is peculiarly hereditary, and a spavined horse or mare should never be used as a breeder.

Speaker of the House: the presiding officer of the British House of Parliament, of the House of Representatives of the Congress of the U. S., of the lower house of State legislatures in the U. S., and in legislatures of the British colonies. In England the title was first employed in the reign of Edward III., but the office is much more ancient. The Lord Chancellor is usually the Speaker of the House of Lords. As the representative of the House, the Speaker communicates its resolutions to others and conveys its thanks or censures. In the U. S. House of Representatives the Speaker presides over the deliberations of that body, appoints its committees, supervises its journal, certifies to the amount of compensation due its members, signs its bills, resolutions, writs, warrants, subpoenas, etc., and has the right as a member to participate in debate after calling another member to the chair. He is chosen by the House from its own number, and can be removed from office by the House.

Speaking-trumpet: an instrument, usually in the form of a hollow truncated cone, the mouth-piece at the smaller end, and the larger end with a reflected lip. It is used for amplifying the sound of human speech and causing its further propagation in one direction. Its chief uses are in shipboard and in giving commands to firemen during conflagrations. The trumpet is of wood or metal. Its invention is ascribed to Kircher and to Sir Samuel Morland. When the instrument is used the air immediately in front is acted upon over as wide a surface that it becomes subject to greater compression and rarefaction. In consequence of the diminished lateral overflow or inflow, thus the air resists its vibrations better and propagates the sound more effectively.

Spear: a weapon of offense, consisting of a wooden handle of greater or less length and a pointed head usually of metal. The general name spear includes all weapons of this class, such as darts, javelins, pikes, lances, etc., whether used as missile or thrusting weapons. The Macedonian and Swiss pikes were from 15 to 20 feet long, the mediæval lance of equal length, and the more modern pike from 10 to 14 feet. The spear and javelin were usually from 4 to 6 feet long and were essentially the same as the Zulu assegai. J. M.

Spear, Cape: See Cape Spear.

Spearpoint: a plant, *Mentha viridis*, of the family Labiæ, found abundantly in Europe and the U. S., generally upon moist soil. It is frequently cultivated for the sake of its leaves, which are used as the chief ingredient in a popular name for weak meats and for imparting a flavor to standard beverages. An oil is also distilled from spearpoint, and from this an essence is prepared, both possessing valuable medicinal uses. It is a handsome plant, with deep green, acuminate, acutely serrate, and nearly sessile leaves, and pale-purple flowers springing from an erect stem, usually 2 feet in height. Revised by CHARLES K. BRISER.

Special Issue (in law): See Issue.

Species: (= Lat. *species*, *species*, look, form, appearance, form, kind; deriv. of *specere*, look, look at) in biology, the smallest group recognized in ordinary classification. In general words the members of a species differ only in minor features, they are capable of interbreeding indefinitely among themselves, and the characters which separate them from other allied forms are capable of definition and are practically permanent. It must be noted, however, that the idea of species belongs rather to metaphysics than to biology, for in the living world sharp distinctions do not really exist, and if we take into account extinct forms all so-called species really intergrade. In classification the species is the lowest subdivision to which a name is usually applied, and in the binomial nomenclature the specific name is always written after that of the genus. Thus in the name of the lion, *Pelecin, Felis* is the generic name and indicates a cat-like animal, while the specific name *leo* indicates the particular kind of cat. J. S. BRIDGES.

Specific Gravity: See Gravity, Specific.

Specific Heat: the thermal capacity of a substance expressed in terms of the thermal capacity of water.

Specific heats are usually measured by heating the body in question to a known high temperature and determining the amount of heat in calories which it gives up in falling to a second, lower, known temperature. This quantity, divided by the number of degrees between the lower and the higher temperature and also by the mass of body in grammes, gives the mean specific heat for the interval of temperatures used. The amount of heat above mentioned is either measured (1) by noting the rise of temperature which it will cause in a given mass of water (method of mixtures), or it is measured (2) by determining the amount of ice which it will melt (method of the ice-calorimeter).

By far the most delicate of all calorimetric operations is the modification of the latter method invented by Rumford, in which the amount of ice liquefied is indicated by the change of volume which it undergoes (method of the Rumford ice-calorimeter).

The following tables give the specific heats of some well-known elements and compounds:

TABLE I.—METALS.

Aluminium	0.2145	Magnesium	0.1696
Antimony	0.0550	Mercury (solid)	0.0315
Bismuth	0.0830	Mercury (liquid)	0.0330
Copper	0.0920	Platinum	0.0321
Iron	0.1134	Silver	0.0563
Lead	0.0314	Tin	0.0562
Lithium	0.9285	Zinc	0.0858

TABLE II.—MISCELLANEOUS SOLIDS AND LIQUIDS.

Ice	0.51	Sulphur	0.176
Glass	0.1	Tinoline	0.034
Wood	0.004		
Alcohol	0.580	Glycerine	0.555
Benzene	0.380	Hydroform	0.590
Carbon disulphide	0.218	Turpentine	0.425
		Ether	0.520

TABLE III.—GASES AND VAPOURS.

SUBSTANCE.	Specific heat (the constant pressure).	Specific heat (the constant volume).
Air	0.2575	0.1675
Oxygen	0.2175	0.1580
Nitrogen	0.2485	0.1670
Hydrogen	0.3400	0.2450
Carbon monoxide	0.2475	0.1600
Chlorine	0.1214	0.0800
Carbon dioxide	0.2194	0.1500

The specific heats of water and of steam are given in the article STEAM (q. v.).

Specific heat depends upon the temperature. Thus for platinum, which may be taken as typical, the values according to Kayser, *Physik*, p. 182) are as follows:

Range of temperature.	Range of temperature.
10° to 100° C.	0.0335
10° to 200°	0.0338
10° to 300°	0.0342
10° to 1,000°	0.0350

The effect of temperature upon the specific heat of liquids is in general more than in the case of solids. There are, however, some anomalies among the latter. The diamond, for example, according to Weyer, possesses a specific heat of 0.0047 at 0° C., which becomes 0.0051 at 100° and 0.0071 at 200°.

See, further, *HEAT, LIQUIDS, and STEAM*; also Regnault, *Quelques Expériences*; Preston, *On Heat*; Stewart, *Heat*; Tait, *On Heat*; or any of the larger treatises on physics.

E. L. NICHOLS.

Specific Inductive Capacity: See **INDUCTIVE CAPACITY**.

Specific Performance: in the equitable jurisprudence of the U. S. and of England, the species of remedy conferred by courts of equity, in which a party is compelled to perform the very thing which he has undertaken to perform in behalf of the person to whom the undertaking is given. In its broadest sense, the phrase would properly describe all the varieties of equitable relief which consist in procuring a defendant upon whom an obligation rests to do the very specific acts which such obligation requires him to do; but in its technical and more restricted signification it is confined to cases in which the obligation arises out of a contract entered into by the defendant. The common law knows but one form of remedy for the breach of any and all contracts—a recovery of money either as debt or damages. Whatever be the nature of the agreement, whatever be its subject-matter, whatever acts or omissions it calls for, a pecuniary compensation for its non-performance is the only judgment that can ever be obtained against the defaulting party by means of the common-law courts. It is very plain that in the innumerable variety of relations incident to modern society contracts will necessarily be made for whose breach this mere pecuniary payment would be an utterly inadequate and often impracticable relief; and a system of municipal law which provided no other kind would fail in maintaining and dispensing the justice which is the final object of all enlightened jurisprudence. To supply this defect in the common-law methods the courts of equity began long since to decree the specific performance of contracts in certain cases; and the general principles which determine the classes of agreements to which this remedy may be applied are now ascertained and well settled, and constitute a distinct department of equity. The doctrine as thus established is shown in the simplest and clearest manner by enumerating the instances in which a specific performance will not be decreed, and which are therefore left within the exclusive jurisdiction of the common-law tribunals and to the application of the common-law remedies:

1. The fundamental and most important rule is, that a specific performance will not be ordered when the complaining party can obtain adequate relief by means of a purely legal judgment. If, therefore, the contract vests the plaintiff with property in a chattel, so that he can recover its possession through an action at law, or if by the money recovered he can restore himself to the same position, in contemplation of law, which he would have occupied if the defendant had fulfilled his agreement, he will be left to his legal remedy alone, and courts of equity will not interfere in his behalf. As an illustration: If the contract relates to ordinary goods and chattels, or to any kind of personal property having a marketable value, and contemplates a delivery thereof in any manner or a transfer of title, since a sufficient sum of money paid to the injured party will always enable him to purchase or procure other articles of a like nature, amount, and value to those stipulated for such a pecuniary compensation is deemed an adequate remedy, and a specific performance will be refused. The example here given, and the fundamental rule which it illustrates, have a very wide application, and they remove at one blow all ordinary agreements concerning personal property, especially those which are mercantile in their character, from the operation of this equitable mode of enforcement. The mere fact, however, that an agreement deals with or relates to personal property does not necessarily withdraw it from the jurisdiction of a court of equity. The subject-matter may be a chattel of some peculiar, intrinsic, but not marketable value, which can not be elsewhere purchased or reproduced, so that the pecuniary damages will not compensate for its loss; and in such cases, although they are exceedingly rare, the specific relief may be obtained. A certain class of covenants, also, wherein the parties promise to execute some further and more formal agreements—as, for example, to execute a marriage or family settlement on wife and children—may be specifically enforced by compelling an execution of the contemplated instrument, although it relates to personal property and not to real estate. These instances, however, are comparatively few, and in the vast majority of contracts concerning personal property or personal services the money-recovery granted by the law

courts is regarded as an adequate relief, and the extraordinary remedy administered by the equity tribunals is denied. In all the subsequent rules it is of course assumed that the agreement, if judged by the principle alone which has already been stated, is one to which the equitable method of enforcement might be applied.

2. In order that a specific performance may be decreed, such a performance must be reasonably possible by the contracting party. If, therefore, by the original terms of the contract he did not have the power to fulfill, or if from circumstances occurring after its execution the power has been lost, even through his own voluntary act, a court of equity will not go through the empty form of ordering an impossibility to be accomplished, and the plaintiff must be contented with an award of pecuniary damages, which perhaps may be enhanced by reason of the defendant's conduct. For example, if the owner of a farm should, by a valid agreement of sale, bind himself to convey it to the purchaser on a future day named, but before that time had arrived should actually convey it to another *bona-fide* grantee, a specific performance of the contract would not be decreed at the suit of the original vendee, because a transfer of the title to him by the vendor would then be impossible, and he would be left to his action for damages. Specific performance can be obtained, however, against a person who buys with notice of a prior contract for the sale of land, or who acquires title to the property without paying value. As a corollary of this rule, it is requisite that the terms of the contract should be so plain and unambiguous that there can be no reasonable doubt as to the intention of the parties, and that this design may be directly carried into effect by the judgment.

3. Not only must the performance be possible by the party upon whom the obligation rests, but the subject-matter of the agreement, and its stipulations in regard thereto, must be of such a nature that the court, by means of its ordinary administrative instruments and machinery, can compel the specific performance which it decrees. Cases may arise, and are not infrequent, in which the court, after directing a performance according to the provisions of the contract, would have no power to enforce its decision directly without departing from its customary functions or incurring an amount of trouble, care, and responsibility incompatible with the discharge of its regular duties; a specific performance will then be refused, however inadequate might be a mere recovery of damages. Under the operation of this principle the agreement of an actor, a singer, a painter, or other artist to employ his talents in a specified manner can not be specifically enforced; and the rule applies in general to all stipulations for personal services, notwithstanding the fact that these services may be of such exceptional value that they can not be procured from any other person but the defendant. For the same reason it has been decided that the specific performance of a contract to construct a railway will not be decreed, since such an undertaking is too extensive and burdensome to be carried on under the direction of a court of equity. See, however, *Wilson vs. Furness Railway Co.*, L. R. 9 Eq. 28; *Laurence vs. Saratoga R. R. Co.*, 36 Hun. 467.

4. Finally, the agreement and the relations of the parties must be such that a decree of specific performance will be reasonable, just, and equitable. It is sometimes said that this remedy is never a claim of right, but is always a matter of discretion. The doctrine as thus stated simply means that in determining whether the relief shall be granted in a given case certain equitable considerations are to be taken into account, and not the mere fact that the agreement is valid in law. The beneficent principle is applied that he who seeks equity must do equity. If, therefore, the contract was procured by overreaching or artifice, although not so tainted with fraud as to be invalid, if it is unfair or oppressive in its terms, if the consideration is grossly inadequate, if its specific enforcement would be unreasonably burdensome to the defendant without any corresponding benefit to the plaintiff, if the plaintiff has been guilty of unnecessary delay in prosecuting the action whereby his opponent has been prejudiced—in these and in similar cases showing a want of good faith or diligence on one side or serious injury on the other, the equitable considerations become controlling, and lead to a denial of the specific remedy.

As the practical result of these rules, the usual contracts enforceable by a decree for a specific performance are those directly relating to land as their subject-matter. It is a settled doctrine of the equity courts that money-damages are not an adequate relief for the breach of such agreements.

This conclusion is partly based upon the fact that a special value may be attributed to the very premises bargained for, which is not susceptible of summary estimate and comparison, but chiefly upon the precedents which the English law has always given to the ownership of land in comparison with every other species of property. Subject, however, to the qualifications heretofore stated, specific performance will be decreed of any contract where the remedy at law is inadequate and specific performance is reasonably possible. On this principle specific performance has been decreed of contracts for the sale of property that could not be purchased in the market (*Thorne v. Commissioner*, 22 Meenan 100; *Eschbach v. Light Co. v. Baltimore Cent. Fire Co.*, 61 Md. 385), of contracts for the sale of debts of an insolvent (*Adams v. Dean*, 1 Sim. and St. 586; *Culling v. Dean*, 35 N. J. Eq. 355), of contracts to give security for a debt (*Taylor v. Eckerd*, 2 Chancery Division 392), and of contracts for the sale of letters patent (*Chambers v. Austin*, 118 Mass. 279). A contract for the conveyance of land, or for the creation of an estate therein, if valid by the statute of frauds, and if complying with the conditions above described, will in general be enforced by a decree of specific performance compelling the execution of the proper instrument and the creation or transfer of the proper interest. What contracts are thus valid under the statute, and how far courts of equity have grafted exceptions upon this enactment, enforcing specific performance of oral contracts, are questions of the highest importance, but can not be treated here. It may be stated, however, in general terms that if the vendor has so far performed the contract that he can not be put *in statu quo*, an oral contract will be enforced, notwithstanding the statute of frauds requires a memorandum in writing of contracts for the sale of an interest in land. This exception is put upon the ground that the defendant shall not be allowed to plead the statute of frauds as perpetually a fraud, a clear case of judicial repeal of legislation. See *FRADING, SPECIFIC* ON.

Revised by WILLIAM A. KEENER.

Specific Volume of Gases: See *HEAT (Density of Gases and Vapors)*.

Spectacles [from Lat. *spectaculum*, sight, show, spectacle, derive, of *specto* vs. frequentative of *specio*, look at]; a device for the improvement of defective sight. (See the article *VISION, DEFECTS OF*.) The invention of spectacles has been variously ascribed to Alexander de Spina, of Florence, or to his contemporary and fellow townsman, Salvino Armato (d. 1317); also to Roger Bacon (d. about 1294). It is more probable, however, that the knowledge of them in Europe came through the Saracen Alhazen (d. 1038). The Chinese have for ages employed spectacles for the relief of defective eyesight, and probably they were known to the ancients. (Consult *History of Spectacles*, by Dr. L. W. Fox, in *Medical and Surgical Reporter*, May 8, 1890.) Lenses for spectacles are spherical and cylindrical. In a spherical lens the surface on one or both sides is a section of a sphere. Rays of light passing through it are refracted equally in all planes. In a cylindrical lens the surface on one side is a section of a cylinder parallel to its axis. Light passing through a cylindrical lens in a plane parallel to its axis is not refracted. At right angles to its axis parallel rays are rendered convergent or divergent according as the cylindrical surface is convex or concave.

Convex spherical lenses ground into spectacles are used (a) to correct presbyopia (a diminution of the range of accommodation, interfering with vision of near objects); (b) to correct hypermetropia, or far sight (over-sight), by increasing the refraction of the eye, so that distant rays instead of coming to a focus behind the retina are accurately focused upon it; (c) to supply the loss of refractive power caused by removal of the crystalline lens, e. g. after extraction of cataract; these must be powerful glasses having an optical value of about eleven dipters. *Concave spherical lenses* are used to correct myopia, or short sight, by lessening the refraction of the eye, so that distant rays instead of coming to a focus in front of the retina are focused accurately upon it. *Cylindrical lenses* are used to correct astigmatism, or a condition in which the refraction varies in the different meridians of the eye. The cylindrical surfaces may be either convex or concave, according as the faulty meridian is myopic or hypermetropic. *Prismatic glasses* are used to relieve muscular weakness of the eye, because a prism will alter the direction of the ray from the point of fixation, so that it coincides with the visual line of the weaker eye.

If there is a combination of astigmatism and hypermetropia or myopia, compound lenses are used. On one face of the glass is ground the spherical curvature necessary to overcome, according as there is hypermetropia or myopia, and on the other the cylindrical curvature to neutralize the astigmatism. Prisms may also be combined with the formula.

Lenses are numbered according to one of two systems. In the first or old system a strong lens of 1-inch focal length is the unit. Lenses weaker than the unit are expressed by fractions; thus a lens of 2 inches focus is expressed as $\frac{1}{2}$, one of 10 inches focus as $\frac{1}{10}$, etc. In the second or new system a weak lens of 1 meter (39.37 in.) focus is the unit, and is called a diopter (abbreviated D.); a lens twice the strength of the unit is 2 D., and has a focal length of 50 cm. Prisms may be designated by their refracting angles or by their angular deviation.

Lenses used to correct optical defects may be mounted in spectacle frames or in eye-glasses. When separate glasses are required for distance and reading they may be combined in one frame by cementing the stronger lens upon the lower portion of the distance glass. These are called cemented bifocals or double-focus glasses, and have replaced largely the old-fashioned Franklin glasses, which were made of two plates divided horizontally and joined by their outer surfaces. Instead of double-focus glasses the reading-lens may be added as a separate glass in a book-rest.

Spectacles should never be worn unless the eyes have been carefully examined by a competent physician, who then writes the formula from which an optician may grind the proper lenses. Glass used in spectacles should be of the best quality, and have an index of refraction of 1.54. Pebble-glass is sometimes employed, but has no special advantages. GEORGE E. DE SCHWEITZ.

Spectacle-snake: See *CORBA DE CAPELLO*.

Spectrophotometer: an instrument for the comparison of any color or wave-length from any given source of light with the same color or wave-length from a standard source.

In the instruments described under *PHOTOMETRY* (p. 45) the comparison is made between the two lights as a whole, and furnishes no indication of the relative intensities of different wave-lengths with each other or with the same wave-lengths from a standard source. For the more detailed comparison of the lights from two sources, each must be resolved into its constituent parts as shown by its spectrum and the two spectra compared, small similar regions of each at a time.

The use of the instrument depends on the fact that the eye readily and accurately compares lights of the same wave-length, while between different wave-lengths only the roughest comparison is possible. See *PHOTOMETRY*.

The instrument is exceedingly variable in form, according to the particular purpose in view. It must, however, include the following elements: (1) Provision for producing in juxtaposition the two spectra with a definite line of demarcation between. (2) Provision for bringing into the field of view separately any given small region of the two spectra. (3) Provision for varying the relative intensity of the light from the two sources so that the intensities of the two constituent parts under observation as judged by the eye may be made equal. The extent to which the relative intensities as a whole are thus modified becomes then a means for the comparison of the intensities of the two particular wave-lengths under observation.

Requirement (1) may be provided either by prisms, as in the ordinary spectroscope, or by a ruled grating, proper provision being made for the introduction and collimation of the two beams of light. Requirement (2) is provided by adjustments similar to those in the spectroscope, and by an adjustable diaphragm in the focal plane of the eyepiece, by means of which the field of vision may be reduced to as narrow a region as desired. Requirement (3) may be provided (a) by an adjustable slit, whereby the extent of the openings for the two beams may be made to vary relatively; (b) by a pair of Nicol's prisms in the optical path of each beam, whence the relative intensity may be varied according to the relative angle between the polarizer and analyzer; (c) by varying the relative distances between the instrument and the two sources of light, as in the ordinary photometer; (d) by a combination of the preceding.

So far as possible the optical paths of the two beams should be similar, i. e. they should consist of the same number of reflections, refractions, and polarizations, and at the same angles, and they should traverse the same amounts of

glass, calcite, and other media. If the paths are essentially different in these particulars, selective absorption and reflection and other disturbing causes may introduce errors into the final comparison.

Various sources of light, such as the sun, the incandescent filament of the glow-lamp, and a standard gas-flame, have been used as standards in work with this instrument.

W. F. DURAND.

Spectroscope [Mod. Lat. *spec'trum* + Gr. *σκοπεῖν*, view]: any instrument for the production and study of spectra. Spectroscopes designed for the precise determination of wave-length are called spectrometers. Spectroscopes may be classified with reference to the nature of the dispersing device, whether prism or grating; or with reference to the dispersing power (high or low); or according to the special purpose to which the instrument is to be put (telespectroscope, microspectroscope, etc.).

Whatever the type of spectroscope, its action is always based upon the principles stated in the article SPECTRUM (q. v.). The essential parts are the slit and the dispersing device, to which may be added the focusing arrangement, and the means of identifying and determining the positions of the various regions of the spectrum under investigation. The slit possesses the same features in nearly all forms of spectroscope. It consists of two parallel jaws of metal, very accurately worked and adjusted. One or both have freedom of motion in a direction at right angles to the length of the slit. Fig. 1 shows one of the best-known methods of produc-

FIG. 1.

ing these motions. The device is due to Hilger. The two edges should be so true in workmanship that when brought within a small fraction of a millimeter of one another the aperture will still be approximately of uniform width throughout. This aperture when illuminated from behind forms the source of light the image of which, dispersed and focused upon a screen, or within the eyepiece of an observing telescope, is to form the spectrum.

Dispersing Devices.—(1) *The Prism.*—The usual material is glass, although for special purposes rock-salt, quartz, fluor-spar, carbon bisulphide, etc., are used. Rock-salt possesses the advantage of extreme transparency for the longer waves of the infra-red to which glass is opaque; quartz has the equally desirable property of transparency in the ultra-violet. Fluor-spar is unique in having a law of dispersion which gives great separation to the longer waves, thus permitting the extension of measurements to regions unattainable with prisms of other materials. This property combined with very complete transparency in the same regions makes fluor-spar one of the most valuable of substances to the student of radiation. Carbon bisulphide is used where a dispersing medium is desired, the law of dispersion of which is known. Cauchy's formula,

$$N_{\lambda} = a + \frac{\beta}{\lambda^2} + \frac{\gamma}{\lambda^4},$$

where N_{λ} is the index of refraction for a wave-length, λ , and a , β and γ are constants, when applied to nearly all substances available in spectroscopy, gives false values for the infra-red. Carbon bisulphide appears to obey the above law for all wave-lengths.

In glass an important quality is high dispersing power, and this is a property which the variety known as flint glass possesses in a high degree. How great is the difference between different sorts of glass will appear from Fig. 2, which shows the spectra produced by similar prisms of crown and of flint glass under like conditions. It will be seen that the distance between the Fraunhofer lines A and H, or, in other words, between the extreme red and the extreme violet, is nearly twice as great in the one case as in the other. Flint glass has one very serious disadvantage for spectroscopic work, viz., that

FIG. 2.

as its dispersive power increases, its transparency, particularly for the shorter wave-lengths, diminishes. Even ordinary optical glasses are far from completely transparent, and the densest varieties are nearly opaque to the extreme violet of the spectrum. In spectroscopes with a single prism the latter is usually equiangular. Where a train of prisms is used to secure high dispersion, lesser angles are frequently employed.

Trains of Prisms and Direct Vision Combinations.—Whenever high dispersion is desired and a prismatic spectrum is preferred to the normal spectrum produced by means of the diffraction grating, a train of prisms is employed. Kirchhoff and Bunsen used for this purpose simply a set of independent equiangular prisms, each mounted upon three pins. These were set up upon a metallic plate, and were adjusted separately by hand until the entire train was symmetrically arranged. As the positions for minimum deviation differed with the wave-length, this laborious operation had to be continually repeated. Later workers with the spectroscope devised automatic trains, such

that the movement of the eye-telescope shifted all the prisms simultaneously into their proper positions. Fig. 3 shows the automatic arrangement due to Rutherford. In the astronomical spectroscope depicted in Fig. 11 a similar train is used.

To avoid the inconvenience of having the collimator and observing telescopes make an angle with one another, as in Figs. 8, 12, and 13, combinations of flint and crown glass prisms are sometimes used in spectroscopes of small dispersion to produce a spectrum without any considerable deviation of the rays from direction of their original path. Fig. 4 shows the usual arrangement, in which $c c c$ are crown-glass and $f f$ are flint prisms. It is an extension by Jansen of the original idea of Amici, who used three prisms, two crown prisms with one flint prism between them. The action of both the three and five prism systems depends upon the difference in the dispersing powers of crown and of flint glass.

It is evident that if the system is so constructed that a certain ray of wave-length, λ , so selected as to lie near the center of the spectrum, emerges with its path parallel to the incident path (as in Fig. 4), rays of other wave-lengths will suffer more or less divergence from that direction. There is a resultant dispersion by such a system, although the mean direction is unchanged.

There are a variety of other methods for rectifying the direction of the dispersed rays in the spectroscope, some involving subsequent reflection by means of a mirror (Fig. 5), others total reflection either within the dispersing prism (Fig. 6) itself (a construction ascribed to Herschel) or by means of a separate rectangular prism properly placed for that purpose (Fig. 7). None of these devices, however, has come into very general use.

(2) *Gratings* for the production of diffraction-spectra are frequently used in the spectroscope instead of prisms as dispersing apparatus. It is used in spectroscopic work (1) whenever a normal spectrum rather than a prismatic spectrum is desired—that is to say, when direct absolute determinations of wave-length are to be made; (2) when high dispersion is wanted. Gratings give relatively greater openness in the longer wave-lengths and less in the violet and ultra-violet than do

FIG. 3.

FIG. 4.

FIG. 5.

FIG. 6.

FIG. 7.

prisms. They are objectionable in some kinds of work on account of the faintness of the spectra produced, of the overlapping of the spectra, and of the fortuitous and altogether irregular distribution of intensities. For photographic work, however, gratings are especially advantageous because the strong absorption which violet light suffers in passing through flint glass (as indicated in a previous paragraph) may be avoided.

Collimator and Observing Telescope.—Spectroscopes of the usual form (Fig. 8) have between the prism or grating and the slit a lens (C), the purpose of which is to bring light to the prism in parallel rays. This lens is attached by means of the connecting tube to the slit at such a distance that the latter is at the principal focus. This arrangement is called the collimator. Beyond the prism the dispersed rays enter the observing telescope (T), which

FIG. 8.

having been focused for parallel light brings the portion of the spectrum under observation to a focus in the eyepiece. Collimator-tube and telescope swing upon a common vertical axis at the center of the instrument. By means of the position of the telescope, as indicated upon a divided circle (a), about which it moves, the region of the spectrum which is in coincidence with the cross-hairs in the eyepiece is identified.

FIG. 9.

Where a grating is used the position of the parts of the spectroscope is that shown in Fig. 9, the telescope being placed on either side of the collimator according as the right-handed or left-handed spectra are to be observed, and at various angles according to the order of the spectrum.

Formerly a train of prisms was used, as in the spectrometer of Kirchhoff and Bunsen (Fig. 10). The automatic train depicted in Fig. 3 was a later form. It found one of its most important applications in the telespectroscope, a well-known form of which is shown in Fig. 11. This instrument, which could be adjusted so as to give any dispersion up to that corresponding to twelve prisms, is constructed in compact form and attached as an eyepiece of a large telescope.

FIG. 10.

Chemical Spectroscopes.—For many purposes the exact but laborious method of determining the position of lines in the spectrum by making readings upon a finely divided circle may be advantageously supplanted by a less precise but more expeditious process. This is true, for example, in the identification of sub-

FIG. 11.

stances by means of their bright-line spectra or in the study of absorption spectra. The first instrument especially de-

signed for such work was the chemical spectroscope of Bunsen (Fig. 12). The circle in this apparatus is dispensed with and both collimator and telescope are fixed. The dispersion is so small as to bring the entire spectrum into the field of view. A third tube, S, carries a transparent scale (photographed upon glass). In Fig. 13 the letter a shows the position of this scale. There is a lens at b by means of which the image of the scale is brought to focus in the eyepiece of the telescope. The rays are reflected from the face of the prism, as shown in the figure. The scale is illuminated from behind by means of a flame, L₁. The appearance of the field of view when a spectrum consisting of bright lines is under observation is shown in Fig. 14.

FIG. 12.

At the hands of Hofmann and of

Krüss and others, the chemical spectroscope has undergone many improvements, among which may be mentioned the introduction of direct-vision prisms and of a scale reading directly in wave-lengths. Fig. 15 shows such an instrument, with diagram of its parts. In the microspectroscope also, or spectroscopic eyepiece, direct-vision prisms are used and the direct-reading scale. This instrument indeed is simply a direct-vision spectroscope of small proportions and adapted to the eyepiece of the compound microscope. In Fig. 16 the cross-section of a microspectroscope is shown, with prism (p) for introduction of a reference spectrum and a scale (s).

FIG. 13.

FIG. 14.

Spectroscopes for the Infra-red and the Ultra-violet.—For the study of the invisible spectrum spectroscopes of the usual forms are ill adapted. Various special types have accordingly been developed.

In the infra-red the conditions are transparency to the longer waves and sufficient dispersion of that part of the spectrum. Rubens uses in such work an instrument with a prism of fluor-spar. Lenses are dispensed with altogether in favor of concave mirrors, which bring the spectral image to a focus upon the filament of a linear bolometer.

In the ultra-violet, where the method is photographic, the best results are obtained by the use of the concave grating of Rowland.

Brashear, in his grating spectroscope for the ultra-violet, mounts grating (G) and plate-holder (P) at the ends of a rigid bar (B, Fig. 17). The grating is placed upon a car with two wheels, which runs along

FIG. 15.

a metal track, $S R_1$. This track extends from the slit in the incident ray. Another track ($S R_2$) at right angles to the

FIG. 16.

FIG. 17.

first carries a plate-holder. The bases upon which grating and plate-holder are mounted are pivoted to the cars on which they are placed, so that the bar can be brought to any angle with the incident ray, both grating and plate-holder remaining

FIG. 18.

always normal to the direction of the bar and at the same distance apart. The law of the grating is such that if the distance between the grating and plate is equal to the radius of the curvature of the former the spectrum will be in focus upon the plate in all positions of the bar. The light to be investigated is focused upon the slit by means of a quartz lens or sometimes by a concave mirror of long focus. Fig. 18 shows the general form of the apparatus.

A description of some of the varied applications of the spectroscopy is given in the article SPECTRUM (q. v.); see also SPECTROPHOTOMETER; also the various treatises named at the end of the former article.

E. L. NICHOLS.

Spectrum [= Mod. Lat., from Lat. *spectrum*, appearance, image, apparition, deriv. of *specere*, look at]: in optics, the image obtained when a ray after dispersion, either by passage through a prism or by diffraction, is brought to a focus. The composite nature of light, through which a spectrum is possible, is explained in the article LIGHT.

The first systematic studies of the spectrum were made by Newton, 1666, and it was he who appears to have first recognized the supreme importance of the phenomena encountered in such observations. Modern spectroscopy, however, may be regarded as having its beginning in the experiments of Fraunhofer, who in 1817, by the use of a narrow slit, first produced well-defined and pure spectra.

The essential parts of the apparatus for the production of such a spectrum are (1) a slit illuminated from behind; (2) a dispersing device (usually a prism or a diffraction grating); (3) a focusing device (a lens or system of lenses, or sometimes a mirror); (4) a screen or an observing telescope, according to the method to be pursued in studying the spectrum.

In Fig. 1 is shown a slit through which light of a wave-length, λ , passes in the direction indicated by the arrow.

FIG. 1.

But for the interposition of the prism P, the lens L would produce an image of the slit S_1 at the conjugate focus S_2 . The prism, however, diverts the ray, and it comes to focus upon the screen t, u . The position of this refracted image depends upon the wave-length. If, for example, the wave-length is one which produces the impression of red upon the retina it will come to focus at r ; if of violet, at v . If the ray passing through the slit be of white light, the entire space between r and v , which we may suppose to be respectively the longest and the shortest rays capable of affecting

the eye, will be filled by colored images of the slit, each differing insensibly from its neighbors in hue. This infinite series of elementary images constitutes what is called a continuous spectrum. Each image has a width proportional to that of the slit, but the centers of contiguous members of the series are only infinitesimally distant from one another. Neighboring images overlap, therefore, with consequent color-mixing.

A pure spectrum, in the language of the spectroscopist, is one in which the effect of this color-mixing by fusion of the overlapping images is absent. In a strict geometrical sense a pure spectrum would be produced only by the use of a linear slit. The successive elementary images differ from one another, however, only infinitesimally in color, and a definite finite difference must exist before the effect of the blended images upon the retina will differ from that of their components. In practice the spectra produced by the dispersion of the light from any narrow slit (up to perhaps .05 cm. for an ordinary spectroscope) may be regarded as pure. The distribution of wave-lengths, and consequently of colors, in the prismatic spectrum is determined by what is called the law of dispersion of the prism. It has not been found possible to give a general expression to this law, applicable to all substances. The phenomenon of dispersion differs indeed in various transparent media, such as calcite, fluorite, rock-salt, quartz, etc., in ways the explanation of which has not yet been attained. In glass, which is an artificial mixture with varying components, the dispersion is to a considerable extent under the control of the maker.

For any particular case the dispersion can be indicated graphically in a simple manner. An important example is that of an equiangular prism of flint glass, the dispersion diagram of which appears in Fig. 2. The ordinates of the

FIG. 2.

curve are wave-lengths in millionths of a meter; the abscissae are distances in passing through the spectrum from violet to red. The vertical lines at the base of the diagram show by their distances apart the relative spaces which exist between wave-lengths 0.40 μ , 0.50 μ , etc.

While this diagram applies only to a particular specimen of glass, it is characteristic to a certain extent of nearly all cases of prismatic dispersion, the peculiarity of which is the increasing separation of the rays as the wave-length diminishes, so that the red end of the spectrum is relatively much more crowded together than the violet end.

The diffraction spectrum (normal spectrum) is produced by means of apparatus, of which that shown in Fig. 3 is typical. The diagram gives only the essential parts, which are the same as those in Fig. 1, with the exception that a reflecting diffraction grating (G) is used instead of a prism. This grating, according to modern practice, would consist of a plate of speculum metal, the surface of which is accu-

ately ground to form a plane mirror, or sometimes a concave mirror with a radius of several feet. Upon this surface are ruled straight equidistant lines to the number of several thousand per centimeter. The process is that described in

FIG. 3

the article **RULING-MACHINES** (q. v.). If monochromatic light from the slit falls upon this ruled surface, it is sent back by reflection from the lines in all directions, in a plane perpendicular to the ruling and to the face of the mirror, and diffraction-bands are formed. These are alternately black and of the color of the light. The law of the position of the colored bands, which are distributed symmetrically with reference to a plane normal to the grating, parallel to the ruling and passing through the slit, is given by the equation

$$\sin \alpha_n = \frac{n\lambda}{a+b}$$

In this formula α_n is the angle that the rays which go to form the n th band of the series make with the incident ray from the slit, λ is the wave-length, while n may be 1, 2, 3, or 4, etc., according to the number of the band which we are considering. The quantity $a+b$ is the distance from the edge of one line upon the grating to the corresponding edge of the next— a being the width of the line, and b the unruled space between it and the next line. The position of the bands with reference to the slit S and the grating G is shown in Fig. 3 (r_1, r_2, r_3 , etc.).

If the light which enters the slit be violet instead of red, the diffraction bands will have positions nearer the slit (v_1, r_2, v_3 , etc.). If white or other composite light be used overlapping diffraction images of the slit will be produced, and these will be so arranged with reference to each other as to form as a series of spectra on either side of the slit.

If, as in the discussion of the prismatic spectrum, we take r_1 , etc., to represent the longest visible wave-length, and v_1 , etc., the shortest, we shall have the intervening spaces in the diagram, viz., $v_1 - r_1, v_2 - r_2, v_3 - r_3$, etc., occupied by spectra. These are called for convenience spectra of the first, second, third, etc., order. It will be noticed that with the exception of the first and second all the spectra overlap.

The formula given above defines completely the position and character of the spectra produced by a grating. It will be seen, for example, that the distance out from the slit to the position occupied by any given wave-length, measured by the sine of the angle α , is proportional to the wave-length. The violet end of the diffraction-spectrum is therefore always nearest the slit. The distribution of wave-lengths throughout the spectrum, moreover, is a uniform one, instead of varying as in prismatic spectra. It is on account of this property that the name *normal spectrum* is applied to a spectrum produced by means of a grating. It is obvious from the formula likewise that $\sin \alpha$ for a given wave-length is directly proportional to the number of lines in a centimeter contained upon the grating, so that the dispersion is entirely a question of the fineness of the ruled surface.

Advantages and Disadvantages of Diffraction-spectra.—The chief advantage of the diffraction-spectrum lies in the simplicity of the law of distribution of wave-lengths. On this account it affords much the best means for the accurate measurement of wave-lengths. It is also a great advantage

to be able to secure any desired degree of dispersion without recourse to the complication and inconvenience arising from the use of a train of prisms. On the other hand, the prismatic spectrum, by equal dispersion, is much more intense, since all the dispersed light goes to the formation of a single spectrum instead of a double series of spectra, and because the losses by reflection, etc., are much less important. Spectra furnished by gratings, moreover, show vagaries in the distribution of intensities, which depend in a complicated manner upon the nature of the ruling. Certain spectra will be very weak or altogether missing, others of abnormal brilliancy. Some spectra will be strong in a certain color and faint in others, etc. The consequence is that diffraction-spectra are ill fitted for use where the question of the relative intensity of the various wave-lengths of a source of light is to be determined.

Classes of Spectra.—Thus far those spectra have been considered in which all wave-lengths between the extreme red and the extreme violet are present. Such spectra are produced by the radiation from glowing solids or liquids; they are called *continuous spectra*.

Where the source of light is an incandescent vapor or gas, radiation is confined to one or more definite wave-lengths. Spectral images corresponding to these wave-lengths only are present in the spectrum, which consists of a group of bright lines, each possessing the color due to its particular wave-length. The intervals lying between are black. Such spectra are called *bright-line spectra*.

A third and very important class of spectra consists of those produced by the passage of light (which would otherwise form a continuous spectrum) through an absorbent medium. This medium may be a solid or liquid, or it may be a vapor. In accordance with the law of Kirchhoff, there is, however, a perfectly definite relation between radiation and absorbing power. Each material, in a word, absorbs the precise wave-length or wave-lengths which it is capable of radiating, and in the same proportion. Gases and vapors, therefore, cut out well-defined and perfectly monochromatic lines from the transmitted light, and thus produce what are called *dark-line spectra*. Solids and liquids, on the other hand, absorb selectively and continuously throughout extended regions, and the spectrum of the rays transmitted by them is crossed by dark transverse bands, varying in position and width and also in density and sharpness of definition according to the character of the medium. Frequently the absorption is such as to weaken or destroy one end of the spectrum instead of producing a band.

Relation of Bright-line and Dark-line Spectra: the Fraunhofer Lines.—When, in 1817, Fraunhofer made the first application of the narrow slit to the analysis of sunlight, he observed that the solar spectrum was crossed by numerous fine black lines. Repetition of the experiment showed him that these lines were always present, and that they were always in the same positions. Fraunhofer made a map of the spectrum in which he designated some of the lines alphabetically. It is by the letters which he assigned

FIG. 4.

to them that they are still known. Fig. 4 shows the positions of a few of the most important Fraunhofer lines in the prismatic spectrum. The wave-lengths are given in the following table:

TABLE I.

Wave-lengths, in millionths of a meter, of the principal Fraunhofer lines. Rowland's values to four places.

Line.	Wave-length.	Line.	Wave-length.
A.....	0.7594 μ	E.....	0.5270 μ
B.....	0.6867	F.....	0.4861
C.....	0.6563	G.....	0.4308
D.....	(0.5896 (D_1))	H.....	(0.3908 (H_1))
	(0.5890 (D_2))		(0.3833 (H_2 or K))

It was nearly half a century after Fraunhofer's observations before the cause of the dark lines in the solar spectrum was determined and their supreme importance in the science of spectroscopy was appreciated. In the meantime the bright-line spectra obtained from the burning vapors of

various metals had been described, and finally, about the middle of the century, certain coincidences of position having been noticed, it began to be suspected that there was some connection between the two classes. Finally Kirchhoff and Bunsen in Heidelberg took the matter up, and by means of an exhaustive series of experiments demonstrated that the dark lines of Fraunhofer are produced by absorption, by the sun's atmosphere, and by that of the earth; also that the materials producing absorption in the sun's atmosphere are, in part at least, identical with those which go to form the crust of the earth. The proof is based in part upon the celebrated experiment of the reversal of the sodium lines, which consists essentially in placing in the path of the rays from any incandescent source of light which

FIG. 5.

In front of an arc-lamp (A, Fig. 5) is placed a condensing lens (C), a vertical slit (S), an object-lens (O), and a prism (P). The lamp A should be tipped back so as give the bright continuous spectrum of the light from the crater of the upper carbon. Before the slit, at *b*, a Bunsen burner is placed, into the flame of which metallic sodium is introduced. The sodium vapor thus produced rises into the path of the ray from A and absorbs light of wave-lengths 5890 and 5896, to which rays it is opaque.

In the spectrum upon the screen *ab* two dark lines are formed, but these lie so close together that under ordinary conditions they are merged into a single heavy black band.

FIG. 6.

By slight modifications of the apparatus it is possible to project upon the screen, one above another, spectra containing the bright line due to incandescent sodium, superimposed upon a continuous spectrum, and the artificially produced Fraunhofer

line D, and thus to note the precise coincidence in the positions of the two. See Fig. 6.

The direct evidence of experiments like the above was supported by measurement of the position of thousands of dark lines in the solar spectrum and of the positions of the thousands of lines obtained by the incandescence of the various chemical elements. The comparison of the two showed the identity of many of the solar lines with those of well-known terrestrial substances. In the cases of metals possessing complicated-line spectra, such as iron, nickel, and calcium, the number of lines in coincidence was so great as to preclude all question of agreement by chance.

A most important example is afforded by the metal iron,

FIG. 7.

in the spectrum of the vapor of which hundreds of lines have been mapped and found to coincide with solar lines.

Kirchhoff and Bunsen explored the entire visible spectrum in the most painstaking and precise manner, measur-

ing the position of thousands of lines in the spectrum of the sun and in those of the different elements. For this purpose they used a spectrometer with a train of four prisms. The results were mapped upon a large scale. Ångström and Thalen made a set of equally careful measurements and produced maps agreeing well with that of the former servers. By the use of concave gratings and photographic plates Rowland has since been able to obtain absolute values of wave-lengths much more accurate than any hitherto made by the system of hand measurements, while Abney and also Cornu, likewise by photographic methods, have extended the spectrum map to regions lying far beyond the limits of visibility in the direction of the red and of the violet. Fig. 7 shows a small portion of the solar map (in the green), which contains lines due to the vapors of iron and of calcium. The coincidence of these with certain bright lines in the spectra of those metals is also indicated.

The application of spectrum analysis in astronomy has led to extraordinary extensions of our knowledge of the chemical constitution and physical condition of the sun, and even of fixed stars, comets, and nebulae. The attachment of the spectroscopic eyepiece to the telescope, for example, has made it possible to explore the surface of the sun in detail with reference to its constitution. Only a few of the numerous striking and beautiful results obtained in this field of research can be mentioned here.

Spectrum of the Chromosphere and Protuberances.

—If the telescope be so adjusted that the field of view, through the slit of the spectroscopic eyepiece (the slit being perpendicular to the limb of the sun), comprises a portion of the sun's face, the chromosphere, with a protuberance, and the sky lying beyond the limits of the latter, as shown in Fig. 8, a triple spectrum will be formed: (1) The spectrum of the photosphere, consisting of the continuous spectrum of the underlying molten constituents of the body of the sun, crossed by the black lines produced by passage through the cooler gases of the solar atmosphere; (2) the spectrum of the protuberance, which consists of the bright lines of the cooler gases corresponding to C and F of Fraunhofer, and a line known as D₃. Until 1895 it was believed that this line had no counterpart among the lines of terrestrial elements, and it was accordingly ascribed to a hypothetical solar element to which the name *helium* was given. In that year, however, the chemist Ramsay announced the discovery of the helium line in the spark discharge of a gas obtained from cleveite, a mineral found in Norway. This bright spectrum is superimposed upon a faint solar spectrum of the usual character, due to diffused or stray sunlight. (3) Diffused sunlight also fills the remainder of the slit, which otherwise would have for its field the blackness of space, so that beyond the limits of the chromosphere we can still distinguish the faint spectrum to which reference has just been made.

This method makes it possible to determine the height to which a given constituent of the chromosphere, such as hydrogen, rises above the limb of the sun, the temperature under which it exists, and even the motions which it undergoes.

The hydrogen-line (F), for example, seen through a narrow slit, the field of which extends across the sun, into and through the chromosphere, sometimes appears as a doublet, the line being reversed at the limb and converging to a point. This effect is indicative of the pressure. Frequently the reversed line of the chromosphere is distorted in a manner of which Fig. 10 is typical. A displacement shows that the glowing gases are moving.

FIG. 8.

FIG. 9.

toward the observer (when the displacement is to the violet) or away from him (when the displacement is toward the red).

FIG. 10.

The same displacement of the lines in the spectra of fixed stars is used in computing the component of their velocity which lies in the line of sight.

The spectra of nebulae and comets show for these bodies a gaseous constitution. Instead of a continuous spectrum with absorption lines, we find in the case of the former class two or three bright lines, ascribable to hydrogen and nitrogen. (See Fig. 11.) Comets also show bright bands which correspond in position to the groups of lines which constitute the spark spectrum of the hydrocarbons. See Fig. 12.

Applications to Chemical Analysis.—The fact that each

FIG. 11.

metal when vaporized and heated emits light of certain definite wave-lengths affords an important means of detecting its presence.

FIG. 12.

The method is used chiefly for the determination of the alkaline metals and the metals of the alkaline earths, since these almost without exception can be made to give their characteristic colors at the temperature of the Bunsen flame. For such purposes a

FIG. 13.

one-prism spectroscopy with an arbitrary scale is commonly used, and the bright lines are mapped with reference to that scale. No accurate determination of wave-lengths is necessary, since the object is simply to recognize the existence of certain well-defined lines, or groups of lines, and to distinguish them from one another. Fig. 13 shows the grouping of lines in the prismatic spectra of the most important of the above-mentioned classes of metals.

Spectrum analysis by means of the bright lines of the elements is a qualitative method of the greatest delicacy.

In the case of the metals easily volatilized in the Bunsen burner it is possible, according to the determinations of Kirchhoff and Bunsen, and of Simmler, of Cappel, and others (see Kayser, *Lehrbuch der Spektral Analyse*, p. 88), to detect the following minute quantities:

TABLE II.

Metal.	Amount detected, grammes.	Metal.	Amount detected, grammes.
Caesium.....	4.00×10^{-8}	Strontium.....	3.33×10^{-8}
Rubidium.....	1.43×10^{-7}	Calcium.....	2.00×10^{-8}
Potassium.....	3.33×10^{-7}	Manganese.....	1.2×10^{-6}
Sodium.....	7.16×10^{-11}	Iodine.....	5.00×10^{-7}
Lithium.....	1.66×10^{-9}	Thallium.....	2.00×10^{-8}
Barium.....	5.00×10^{-7}	Copper.....	3.5×10^{-8}

The spectrum of the metals depends to a great extent upon the temperature of the incandescent vapor. Heating does not shift the position of the lines, but it increases their brilliancy and brings into view new ones, which had been too weak to be seen in the spectrum of the cooler vapor. Sodium, for example, which in the Bunsen flame shows only the well-known double line D, has been found by Liveing and Dewar to possess at higher temperatures at least seven other pairs of lines distributed throughout the spectrum from red to violet. A convenient method of getting high-temperature spectra consists in volatilizing the metals in the electric spark. In this way the brilliancy of the spectrum is enhanced, and new metals, too refractory for vaporization at flame-temperatures, are made amenable to the methods of spectrum analysis. The delicacy of the method of the spark-spectrum, in the case of various metals, many of which give no line-spectrum whatever in the Bunsen flame, is given in table III.

TABLE III.

Metal	Amount detected, grammes.	Metal.	Amount detected, grammes.
Caesium.....	2.5×10^{-7}	Cobalt.....	6.66×10^{-8}
Rubidium.....	1.00×10^{-6}	Nickel.....	1.66×10^{-6}
Potassium.....	2.5×10^{-6}	Iron.....	3.84×10^{-6}
Lithium.....	2.5×10^{-11}	Thallium.....	1.25×10^{-11}
Barium.....	1.11×10^{-11}	Cadmium.....	5.55×10^{-8}
Strontium.....	1.00×10^{-11}	Lead.....	5.00×10^{-8}
Calcium.....	1.00×10^{-10}	Bismuth.....	1.43×10^{-8}
Magnesium.....	2.00×10^{-9}	Copper.....	5.00×10^{-8}
Chromium.....	2.5×10^{-10}	Silver.....	8.33×10^{-8}
Manganese.....	5.00×10^{-9}	Mercury.....	1.00×10^{-7}
Zinc.....	1.66×10^{-9}	Gold.....	2.50×10^{-7}
Iodine.....	1.11×10^{-8}	Tin.....	5.88×10^{-8}

Absorption Phenomena by Transmission through Solids and Liquids.—Spectrum analysis is not confined to the detection of elements by means of the bright lines of their emission spectra and the corresponding black lines in the spectra of the sun and stars. It makes use also of the selective absorption which light suffers when transmitted through various solids and solutions. In cases in which the absorption is confined to certain definite regions dark bands are formed, the position of which indicates the character of the absorbing medium, while the density and width of the

FIG. 14.

bands enables the experimenter to estimate the strength of the solution with considerable accuracy. Well-known cases are those of chlorophyll and blood, the spectra of which are shown in Fig. 14. Cerium, didymium, and other of the

rare earths lend themselves peculiarly to this method, on account of the sharpness of their bands. (See Fig. 15.) When

FIG. 15.—Absorption bands due to didymium.

small dispersion is used some of the narrower bands might easily be mistaken for true Fraunhofer lines, but higher dispersion shows them in their true character.

Even when no sharply marked bands are produced a spectrophotometric study of the absorption spectrum often

FIG. 16.

affords definite information concerning the character of the transmitting medium. A solution of potassium chromate, for example, submitted to measurement gave the curve of brightness shown in Fig. 16, in which abscissas are wave-lengths and ordinates are percentages of light transmitted. Pigments, viewed by reflected light, give spectra, likewise capable of spectrophotometric analysis and characteristic of the chromatic properties of the material. Figs. 17a and 17b

FIG. 17 a.

of a glowing body at different stages of incandescence and comparison of the same, wave-length by wave-length, with the spectrum of a standard lamp, the development of radiation with rise of temperature can be definitely determined.

Fig. 18 shows the results of such an investigation of the spectrum of platinum between 700° C. and 1,000° C. The ordinates are ratios of the brightness of the platinum spectrum to that of the standard lamp, which was an electric glow-lamp maintained as nearly as possible at a temperature of incandescence corresponding to that of a luminous gas-flame. The adjustment was such that the brightness of the platinum spectrum at 1,000°, wave-length 59μ, was equal to that of the corresponding wave-length in the spectrum of the standard.

FIG. 17 b.

Invisible Parts of the Spectrum (the Infra-red and Ultra-violet).—When a spectrum is produced by refraction or diffraction, the only rays capable of affecting the retina lie between wave-lengths 39μ and 76μ. Rays of wave-lengths both longer and shorter than the above are present, however, and these constitute the *invisible spectrum*. Waves greater than 76μ find positions lying beyond the extreme limit of the red. They form what is termed the region of the *infra-red*. Waves shorter than 39μ are all more strongly refracted than the rays of the visible spectrum. They lie beyond the limits of the violet and constitute the *ultra-violet* spectrum.

In the investigation of these invisible rays indirect methods have to be used. For the infra-red the rays may be allowed to fall upon some surface which becomes luminescent (phosphorescent) under their action. This is the method used by Draper, by Becquerel, and by Lommel and others.

The result of this process is to cause those portions of the luminescent surface upon which the infra-red rays fall to shine, while the other portions remain dark. In this way the intenser portions of the infra-red spectrum can be explored, and if the law of the dispersion apparatus is known they can be mapped.

It is possible also, as has been shown by Abney, to obtain photographic plates which are sensitive to long wave-lengths, and by the use of these to photograph a considerable portion of the infra-red spectrum.

The most complete method of studying the invisible regions beyond the red consists in measuring the intensity of the rays directly by means of their heating effect. For this purpose Fizeau and Foucault used thermometers; Laman-sky, Mouton, Dessains, Nichols, and others the linear thermopile; Langley, Ångström, Snow, Paschen, and many other observers the bolometer.

By these various methods it is known that the region of the infra-red is similar to the visible region of the spectrum in nearly every particular, but that it comprises a very much greater range of wave-lengths. While the visible spectrum is all included within about an octave, the bolometer gives evidence of waves more than ten times as long as the longest visible ray. If the spectrum of an incandescent solid be explored by means of thermopile or bolometer, the infra-red spectrum will be found to be continuous, the intensities rising to a maximum in some region, the wave-length of which depends upon the temperature of the source. See Fig. 18, which gives Langley's curve of intensities in the spectrum of a luminous gas-flame.

FIG. 18.

If the source have a temperature below the red heat an infra-red spectrum will still be found to exist, the intensities of which are all less and the maximum in a region of greater wave-length. The curve of intensities, moreover, will disappear on the side toward the red, before the boundary of the visible spectrum is reached. See Fig. 21.

FIGS. 19, 20, and 21, showing the curves of intensities of sunlight, of gas flame, and of a solid below red heat, respectively.

If the source be sunlight we find its spectrum crossed by dark lines and also by bands due to absorption on the part of the atmosphere of the earth. The curve then appears as in Fig. 19, which is also from measurements by Langley.

If the source be a metallic vapor the bolometer indicates the extension of a bright-line spectrum characteristic of that metal throughout the infra-red. Fig. 22 is a diagram giving the results of bolometric exploration of the spectrum of potassium, made by Snow. Abscissas are wave-lengths and

FIG. 22.

ordinates are intensities. It will be seen that there are three bright lines between 1.0μ and 1.3μ , and probably a group of lines, which could not be resolved by means of the bolometer, in the region 1.5μ .

In the ultra-violet region of the spectrum the intensity of radiation is too small to admit of the general use of bolometric measurements. These shorter wave-lengths are, however, readily studied by photography, and they can also be rendered visible by the use of a luminescent (fluorescent) substance, as has been shown by H. Becquerel, Soret, and others. Among the materials which give back visible rays when exposed to the action of the ultra-violet are chlorophyll solution, petroleum, various coal-tar dyes in solution; also uranium-glass and some sorts of fluor-spar. See FLUORESCENCE.

Of the two methods, the photographic is by far the more complete and satisfactory. By means of the sensitive plate and the concave grating, maps giving every detail may be obtained. If the apparatus be of such a character that the rays pass through glass, the spectrum will seem to come to an end in the neighborhood of $.32\mu$, because glass becomes opaque to still shorter wave-lengths. If quartz lenses be substituted, or if concave mirrors be used instead of lenses, the map can be extended even further beyond the violet.

The results of investigations in the ultra-violet, as in the case of those upon the infra-red of the spectrum, show that no sudden changes take place as we pass beyond the limit of visibility. Sunlight, in the ultra-violet, still shows a continuous spectrum crossed by a multitude of dark lines: glowing vapors, such as those of the electric arc, show groups of lines which to an eye capable of vision in such rays would constitute a bright-line spectrum of the usual type.

See, further, article SPECTROSCOPE; also Schellen, *Spectrum Analysis*; Roscoe, *Lectures on Spectrum Analysis*; and the works of Lockyer, Huggins, Langley, Vogel, K. Ångström, Abney, H. Becquerel, Soret, etc. E. L. NICHOLS.

Spectrum Analysis: See SPECTROSCOPE and SPECTRUM.

Speculation: See POLITICAL ECONOMY.

Speculum [Lat., mirror]: in optics and astronomy, a reflecting surface, usually of metal, though the term has also been frequently applied to unsilvered glass since the introduction of silvered-glass telescopes by Foucault and Steinheil in 1857. See TELESCOPE.

Spedding, JAMES: scholar; b. near Bassenthwaite, Cumberland, England, in June, 1808. He studied at Trinity College, Cambridge, of which college he was afterward made an honorary fellow; graduated in 1831. His life-work was the study and exposition of Bacon, begun by a pitiless exposure of Macaulay's showy and inaccurate essay on Bacon, *Evenings with a Reviewer* (privately printed in 1848 and reissued in 1882). His great edition of the *Works of Francis Bacon* was published in 7 vols. in 1857-59. In this he was assisted by R. L. Ellis and D. D. Heath. In 1870-76 he published a *Life and Letters of Francis Bacon*, including all his occasional writings, also in 7 vols.; and in 1878 *Life and Times of Francis Bacon* (2 vols.). Besides his work on Bacon he was the author of *Publishers and Authors* (1867) and *Reviews and Discussions* (1869). D. in London, Mar. 9, 1881. H. A. BEERS.

Speech: See LANGUAGE and ACOUSTICS (*The Voice*).

Speed, JAMES: lawyer; b. in Jefferson co., Ky., Mar. 11, 1812; graduated at St. Joseph's College 1828; studied law at Transylvania University; began its practice at Louisville 1833; was a member of the Legislature in 1847, State Senator 1861, U. S. Attorney-General Nov., 1864-July, 1866, and in the same year was chosen president of the Philadelphia Loyalists' convention; was Professor of Law in the University of Louisville. D. at Louisville, Ky., June 25, 1887.

Speed, JOHN: antiquary; b. at Farrington, Cheshire, England, in 1542; was a tailor in London until late in life, but at the same time was amassing an extensive knowledge of English antiquities, and was enabled by Sir Fulke Greville to publish a costly and valuable series of works. He published anonymously about 1590 a treatise on the *Genealogies of the Scriptures*, afterward prefixed to the first edition of King James's Bible (1611), but his first appearance as an author was in 1608, when he printed fifty-four maps of various counties and cities, and engravings of antiquities of England and Wales, which were incorporated into *The Theatre of the Empire of Great Britain* (folio, 1611). In the same year he published his *History of Great Britain under the Conquests of the Romans, Saxons, Danes, and Normans*. D. in London, July 28, 1629.

Speedwell: a plant of the genus *Veronica* of the family *Scrophulariaceae*. The species are very numerous, comprising annual and perennial herbaceous plants and small shrubs,

natives of temperate and cold climates in all parts of the globe, some of them growing in wet ditches or in marshes, others on the driest soils, but all having very beautiful blue, white, or pink flowers. Revised by CHARLES E. BESSEY.

Spelchorn, or Spichern: See SAARBRÜCKEN.

Speler: See SPEYER.

Speke, JOHN HANNING: explorer; b. at Jordans, Somersetshire, England, May 4, 1827; entered the army in 1841; served in India and in the Crimean war; accompanied Capt. Richard F. Burton in the expedition which resulted in the discovery of the great lakes of Central Africa, and afterward was at the head of another expedition (with Capt. Grant) which discovered the connection of the Nile with those lakes. Capt. Speke published a *Journal of the Discovery of the Source of the Nile* (1863), and *What Led to the Discovery of the Source of the Nile* (1864); received gold medals from the geographical societies of France (1860) and England (1861), and from the King of Italy; and was engaged after his second expedition in a bitter controversy with Capt. Burton as to the merits of their respective discoveries. He accidentally shot himself near Bath, Sept. 15, 1864, and died on the same day.

Revised by M. W. HARRINGTON.

Spelman, Sir HENRY: antiquary; b. at Congham, Norfolk, England, in 1562; graduated at Cambridge about 1580; studied law at Lincoln's Inn, but devoted himself chiefly to archaeology; was in 1604 high sheriff of Norfolk; was employed by James I. upon important commissions; was knighted about 1612, in which year he withdrew from public business and settled in London; published his treatise *De Non Temerandis Ecclesiis; of the Rights and Respects due to Churches* (1613). D. in London in 1641, and, by special order of Charles I., was buried in Westminster Abbey, near the monument of Camden. Vol. i. of his *Glossarium Archæologicum*, extending to the letter L, was published 1626; vol. ii., completed by his son, Sir John, and by William Dugdale, appeared in 1664, and the whole work was issued in a single folio volume in 1687. Vol. i. of the *Concilia* was issued in 1639; vol. ii., chiefly by Dugdale, in 1664. The *Reliquiæ Spelmannianæ* (Oxford, folio, 1698), with a *Life*, was edited by Bishop Edmund Gibson.—His son, Sir JOHN, was knighted 1641 "in consideration of his father's good services both to Church and state," and was made master of Sutton's Hospital. He edited the *Saxon Psalter* (1641) and a *Life of Alfred the Great* (Lat. trans. 1678; Eng. original edited by Thomas Hearne, 1709). D. at Oxford, July 25, 1643.—EDWARD SPELMAN, a great-grandson of Sir Henry, published an elegant translation of Xenophon's *Anabasis* (1742) and of the *Roman Antiquities* of Dionysius Halicarnassus (4 vols. 4to, 1758). D. in Norfolk in 1767.

Spelt [O. Eng. *spelt*, from Lat. *spelta*, spelt]: the *Triticum spelta*, probably the far of the ancient Romans and the *zea* of the Greeks; a grain somewhat resembling wheat, but distinct from it. It can be grown on poorer soils than those which are required for wheat. It is much raised in parts of Europe, and crops of it are occasionally seen in the U. S., as in Virginia. In quality it is much inferior to wheat. *T. bengalense* is raised in India. Lesser spelt, or St. Peter's corn (*Triticum monococcum*), called also one-grained wheat, is raised to some extent on poor soils in Europe.

Spelter: the commercial name for zinc in pigs or blocks. See ZINC.

Spencer: city; capital of Owen co., Ind.; on the White river, and the Penn. Railroad; 52 miles S. W. of Indianapolis (for location, see map of Indiana, ref. 8-C). It is in an agricultural, stock-raising, and lumbering region; has valuable building-stone quarries, block and cannon coal mines, woolen, flour, saw, and planing mills, machine-shops, and pork-packing house; and contains a State bank with capital of \$50,000, a private bank, and two weekly newspapers. Pop. (1880) 1,655; (1890) 1,868.

Spencer: town; capital of Clay co., Ia.; on the Little Sioux river, and the Chi., Mil. and St. P. Railway; 80 miles N. W. of Fort Dodge (for location, see map of Iowa, ref. 2-E). It is in an agricultural and stock-raising region, and contains a national bank with capital of \$100,000, a State bank with capital of \$25,000, 2 private banks, and 3 weekly newspapers. Pop. (1880) 1,392; (1890) 1,813.

Spencer: town; Worcester co., Mass.; on the Boston and Albany Railroad; 11 miles S. W. of Worcester, one of

the county-seats (for location, see map of Massachusetts, ref. 3-F). It contains a public high school, the Richard Sugden Public Library (founded in 1857), electric railway, a national bank with capital of \$150,000, a savings-bank, and three weekly newspapers. The principal industries are the manufacture of shoes and wire. Here, it is claimed, is the largest shoe-factory in the world. Spencer was originally in the grant of Leicester; was made the West Parish of Leicester in 1744; incorporated as a town under its present name in 1753; and its first church was organized in 1744. Pop. (1880) 7,466; (1890) 8,747.

EDITOR OF "LEADER."

Spencer, HERBERT: philosopher; b. in Derby, England, Apr. 27, 1820; was an only surviving child. His father and grandfather were teachers. Of delicate health in boyhood, he was subjected to little outside pressure, his father, a man of strong character, more than usual breadth of culture, and original views, supervising his early education, but leaving him very much to himself. At the age of thirteen he was sent to study with an uncle, the Rev. Thomas Spencer, a liberal clergyman and a scholar, at that time perpetual curate of Hinton Charterhouse, near Bath. Here he remained three years, carrying on the study of natural history, begun in early childhood under his father's encouragement, and devoting himself to mathematics, where the originality of his mind was strikingly shown by the development of a taste and capacity for working out original problems. He then, too, became familiar with physical and chemical operations, his intellectual bias being strongly in the direction of experimental inquiry and original research. Deciding, in opposition to his uncle's wishes, not to prepare himself for a university career, he returned to Derby, where he was busied for a short time with inventions and miscellaneous study, and, after a brief interval of teaching, in 1837 entered the office of Sir Charles Fox, and began work as a civil engineer. After this he was engaged for several years on railways, devoting his spare time to scientific experiments and studies, and to occasional contributions to *The Civil Engineer and Architect's Journal*. The first indication of his awakening interest in other directions was given in 1842 by the publication in *The Nonconformist* of a series of letters on *The Proper Sphere of Government*. These were reprinted in pamphlet form during the following year, and are interesting as containing, in crude form, the first suggestions of many opinions on social questions afterward so fully developed in his maturer works. Growing discouraged with the prospects of his profession, he presently gave up engineering work and moved to London, where he secured a position on the staff of *The Economist* newspaper, of which in 1848 he became sub-editor. In 1850 he published his first considerable work, *Social Statics*, which was largely a development in more scientific form of the ethical and sociological ideas contained in his letters on government. The work was a treatise on social science, based upon the conception of the evolution of society through the operation of natural laws; and, though Spencer afterward grew dissatisfied with its metaphysical implications, it excited widespread interest at the time on account of its original and advanced views. He then devoted himself to literary work, contributing elaborate articles on a large variety of subjects to the leading English reviews. But though the subject-matter of his work led him into widely diversified fields of knowledge and inquiry, his course of thought was systematic; and the numerous masterly essays which he published from 1852 to 1860 were mainly devoted to the elaboration and application to various important questions of the principle of evolution. These papers reappeared in the U. S. in the collections entitled *Illustrations of Universal Progress; Essays, Moral, Political, and Æsthetic; Education, Intellectual, Moral, and Physical; and Recent Discussions in Science, Philosophy, and Morals*. In 1855 Spencer published a very able and original work entitled *The Principles of Psychology*, pronounced by J. S. Mill to be "the finest example we possess of the psychological method in its full power." In this work (afterward included in his larger treatise on the same subject) the doctrine of evolution was applied to the science of mind. Life is conceived as "the definite combination of heterogeneous changes, both simultaneous and successive, in correspondence with external coexistences and sequences"; and the ground taken is therefore that mental faculties throughout the whole scale of animal life, from lowest to highest, have been developed by experience through the intercourse of organisms with their environment, the principles of variation

and heredity being marked out as the causes of the slow modifications which have taken place during vast periods of time. The work was so profound in exposition, and so greatly in advance of the thought of the day, that it produced but little public impression. Spencer had grasped the conception of evolution in its broad relations, and in 1852, while engaged on an essay on the nebular hypothesis, he reached the conclusion that it is a universal process, dependent upon the laws of matter and force, unperformed in by all orders of phenomena, and capable of being resolved and formulated. Being the great principle or law of the successive changes of phenomena, involving the unfolding and on its obscure side and as its necessary corollary the dissolution of all things, it seemed to offer the basis of a philosophy of nature from the genetic point of view—understanding by the term "philosophy" the complete unification of positive knowledge by universal principles. In other words, the conception of evolution presented itself to him as the basis of a system of thought under which was to be generalized the complete history of the knowable universe, and by virtue of which all branches of scientific knowledge were to be unified by affiliation upon the primal laws underlying them all. Though a rough sketch of the main outlines of the system, as they occurred to him at the time, was mapped out almost immediately, it was not till the following year, 1853 (a year otherwise memorable for the publication of Darwin's *Origin of Species*), that a detailed plan of the various connected works in which these conceptions were to be developed was finally drawn up, and not till 1893 that it was given to the small handful of readers interested in such subjects in the form of a prospectus. This prospectus contained a complete outline of the ten volumes which were to be devoted to the carrying out of the task, and brief comparison of the analysis there given with the works themselves, so far as they have been issued, will show how clearly he must have had the whole vast scheme sketched out in his mind, down to the minutest details, before he set himself to the penning of a single line. To the prosecution of this great enterprise the major part of the energies of his life has from that time forth been devoted, and the *System of Synthetic Philosophy* has been actually brought within measurable distance of completion. Plans have been left in the methodological divisions, and will probably never be altogether filled up; but save for these lacunae the work stands in practically finished form. The introductory volume of the series, *First Principles*, was published in 1862, and was concerned with the establishment of those first or foundation principles which, there classed together in their most general and abstract statements, were in subsequent volumes to be worked out through the special phenomena of biology, psychology, sociology, and ethics. The initial task was to define the limits of philosophy, and this is done by the postulation of two categories, the unknowable and the knowable, to the former of which is relegated the absolute, infinite, or unconditioned, and all that pertains thereto, while the latter is seen to include the relative, finite, or conditioned, which alone constitutes the sphere and subject-matter of philosophy properly so called. In this way Spencer aimed to clear the field of his inquiry of what he deemed to be the fruitless speculations of metaphysics, so that his proper work might be coextensive with the sphere of science and strictly conform to its methods. Yet, while confining his attention within the limits of the phenomenal universe, Spencer shows that by the very terms of its cognitions the mind can not escape the consciousness of an unknowable power, of which all phenomena are manifestations, and which remains the ultimate and unmovable basis of consciousness, though, from the nature of human intelligence, it can be neither grasped nor understood. Covering these preliminary considerations in the space of something over 100 pages, *First Principles* proceeds to deal with the foundations of the scheme; and here the law of evolution is broadly worked out and formulated in terms of matter and motion, or rather in terms of force, into which our conceptions of matter and motion alike are shown to be in the last analysis resolvable. Thus, as legitimate concepts of science, furnish a proper basis for a superstructure of philosophy. All the "phenomena of the universe," from their great features down to their minutest details, are necessary results of the persistence of force under its forms of matter and motion. This persistence of force gives rise "throughout the universe in general and detail," to unceasing redistributions of matter and motion; and these redistributions constitute evolution "where there is a predominant integration of matter and

dissipation of motion," and dissolution "where there is a predominant absorption of motion and disintegration of matter." The rhythm thus set up by these changes and counterchanges "is, so far as we can see, universal and eternal, each alternate phase of the process predominating now in this region of space and now in that, as local conditions determine"; the tendency in that portion of the universe with which we are acquainted being now in the direction of evolution. There is thus reached the famous definition of evolution as "a change from an indefinite, incoherent homogeneity to a definite, coherent heterogeneity, accompanying the dissipation of motion and integration of matter" (or, as the author statement read: "through continuous differentiations and integrations"). This formula sums up and covers all the processes of development in nature and in mind (in other words, all changes along what we should call the ascending scale as contradistinguished from the descending scale of dissipation, from the unravelling of a planetary system to the opening of a way-side flower, and from the genesis of intelligence to the latest variations of social life. These first principles being thus laid down in their broadest and most abstract statements, Spencer proceeded to the task of working them out in greater detail through all the varied phenomena presented by the universe at large. First in order should properly have come the application of such principles to inorganic nature, but this great division was passed over entirely, partly (in quite his own words) because "even without it the scheme is too extensive, and partly because the interpretation of organic nature after the proposed method is of more immediate importance." Spencer therefore at once went to work upon the *Principles of Biology*, which he completed in two volumes in 1867. Here the principles of evolution are traced out through the phenomena of life and the laws of organization, one of the most profound and noteworthy parts being that dealing with the "laws of multiplication," and the inferences to be deduced from them in regard to the "multiplication of the human race" and "human evolution in the future." This leads forward inevitably (since we know intelligence only as a concomitant of organization) into the region of psychology; and in 1873 Spencer published *The Principles of Psychology*, also in two volumes. This new work was based upon the treatise of 1853, but embraced many important modifications and extensions to which he had been led by his subsequent studies. It is an elaborate exposition of mental science grounded on biology and interpenetrated everywhere by the doctrines of evolution; and in it, in the opinion of many good judges, Spencer's powers as a thinker and writer reached their culminating point. The fourth division of the system, *The Principles of Sociology*, outlined to occupy three volumes, is at present (1895) incomplete. The first volume, of great bulk, comprising the *Data and the Antecedents of Sociology*, and a consideration of domestic relations, was finished in 1876; and this was followed at irregular intervals by parts iv., v., and vi., treating of *Ceremonial Institutions*, *Political Institutions*, and *Ecclesiastical Institutions*, all from the standpoint of evolution. But meanwhile, led by increasing ill health to fear lest persistence in the order sketched out in the original prospectus might result in the final and most important portion of the work—*The Principles of Ethics*—being left untouched altogether, Spencer decided to drop the uncompleted part of the *Sociology*, and to devote what remained of life and energy to carrying his principles forward as far as possible into the region of ethics. As a result of this determination appeared in 1879 the first installment of the proposed *Principles of Morality*, *The Data of Ethics*, which, as the first systematic attempt to place ethical questions upon the new basis of evolution, merits the closest attention. This was followed in 1881 by part iv., on *Justice*, a little work dealing with some of the most important issues at present under discussion; in 1892, by parts iii. and v., the *Inductions of Ethics*, and the *Ethics of Individual Life*; and in 1893 by parts v. and vi., on negative and positive beneficence; the treatise on morality being thus completed in two volumes. The volumes comprising the *Synthetic Philosophy*, vast as is the labor which they represent do not exhaust the list of Spencer's works. In 1873 appeared in the International Scientific Series, his delightful little introductory treatise on *The Study of Sociology*; and in preparation for his work in that subject, he also supervised the publication of the *Descriptive Sociology*—an immense cyclopedia of facts designed to exhibit the characters of human societies of all types and in every stage of

development. Eight out of the proposed eighteen parts of this were produced, and then, owing to the enormous expense incurred and the scanty public support, Spencer found himself forced to relinquish the undertaking. The astounding extent of Spencer's life labors becomes all the more marvelous when one considers the impaired health which has for many years past incapacitated him for regular and persistent work. His life has thus necessarily been a very retired and, externally considered, a very uneventful one. He has never married, and has uniformly declined all university honors and invitations to join scientific societies. He visited the U. S. in 1882, remaining from August to November. See POSITIVISM.

WILLIAM HENRY HUDSON.

Spencer, JESSE AMES, D. D.: educator and author; b. at Hyde Park, N. Y., June 17, 1816; graduated at Columbia College 1837; studied theology at the General Seminary of the Protestant Episcopal Church; was ordained 1840; was rector of St. James's church, Goshen, N. Y., 1840-42; Professor of Latin and of Oriental Languages at Burlington College, New Jersey, 1849-50; editor and secretary of the Episcopal Sunday-school Union and Church Book Society 1851-57; declined the vice-presidency of Troy University 1858; was rector of St. Paul's, Flatbush, L. I., 1863-65, and was from 1869 Professor of Greek in the College of the City of New York. He was the author of a volume of religious *Discourses* (1843); *History of the English Reformation* (1846); *The East, Sketches of Travel in Egypt and the Holy Land* (1850); a widely circulated *History of the United States* (4 vols., 1856-69); *Greek Praxis* (1870); and *A Course of English Reading* (1873). Dr. Spencer was editor of *The Young Churchman's Miscellany* (1846-68); of 6 vols. of the Classical Series of Thomas K. Arnold (1846-50); of a *New Testament in Greek* (1847), with notes; *Cæsar's Commentaries* (1848), with notes and a lexicon; of *Pycroft's Course of Reading* (1844); of Archbishop Trench's *Poems* (1856); of a new edition of Prof. Alpheus Crosby's *Anabasis* (1875); and *Origen's Works* (vol. iv. in Ante-Nicene Library, 1885).

Revised by W. S. PERRY.

Spencer, JOHN, D. D.: b. at Bocton, Kent, England, in 1630; educated at the King's School, Canterbury; graduated at Cambridge about 1650; obtained a fellowship at Corpus Christi College 1655; took orders in the Church of England; became rector of Landbeach, master of Corpus, and archdeacon of Sudbury 1667; prebendary of Ely 1672 and dean of Ely 1677. D. at Cambridge, May 27, 1695. He was the author of *A Discourse concerning Prodiges* (1663; 2d ed. 1665); *Dissertatio de Urin et Thummin* (1669). He is best remembered by his *De Legibus Hebraeorum Ritualibus et earum Rationibus* (Cambridge, 1685), a work of great learning which excited much controversy. It maintained that the Hebrew ritual was almost entirely borrowed from the Egyptian—a view previously upheld by Maimonides in his *More Nevochim*, and by Sir John Marsham in his *Canon Chronicus Egyptiacus*, defended by Bishop Warburton and combated by Witsius, Shuckford, Dr. Woodward, and William Jones of Nayland, but now abandoned. Editions of this work were published at The Hague (1686), and at Leipzig (1705). A new edition, brought out by Dr. Leonard Chappelow (Cambridge, 2 vols., 1727), contained a supplementary book (the fourth) left in MS. by the author, and the whole work, with a memoir and a commentary by C. M. Pfaff, was published at Tübingen (2 vols., 1732).

Revised by S. M. JACKSON.

Spencer, JOHN CANFIELD, LL.D.: lawyer; son of Ambrose Spencer (1765-1848), chief justice of the State of New York; b. at Hudson, N. Y., Jan. 8, 1788; graduated at Union College 1806; was private secretary to Gov. Daniel D. Tompkins 1807-08; admitted to the bar at Canandaigua 1809; became master in chancery 1811, judge-advocate-general on the northern frontier 1813, assistant attorney-general for Western New York 1815, member of Congress 1817-19, of the State Assembly 1819-20, being Speaker the latter year; State Senator 1824-28; commissioner to revise the statutes of New York 1829; special attorney-general to prosecute the murderers of William Morgan; was secretary of State and superintendent of common schools 1839-41; Secretary of War under President Tyler from Oct., 1841, to Mar., 1843, when he was transferred to the Treasury Department; resigned the latter post 1844 in consequence of his opposition to the annexation of Texas, and thenceforth devoted himself to the practice of his profession. The organization of the State asylum for idiots and the improvement of the common-school system were largely due to him, and he served on

many important State commissions. He edited, with a preface and notes, de Tocqueville's *Democracy in America* (2 vols., New York, 1838), and with John Duer and Benjamin F. Butler a *Revision of the Statutes of New York* (3 vols., Albany, 1846). D. at Albany, N. Y., May 18, 1855.

Spencer, JOHN CHARLES, third Earl Spencer, better known as Lord Althorp: statesman; b. May 30, 1782; eldest son of George John, second Earl of Spencer; educated at Harrow and at Trinity College, Cambridge; was elected to Parliament 1804; held office under Fox as Junior Lord of the Treasury from Feb. 11, 1806 to Mar., 1807; sat in Parliament for the county of Northampton from Dec., 1806, till the passage of the Reform Bill 1832, during which long period he was one of the leading members of the opposition; was especially prominent in the attacks upon the financial policy of the Tory administrations; was Chancellor of the Exchequer and ministerial leader of the House of Commons in the reform ministry of Earl Grey 1830-34; succeeded his father as Earl Spencer in Nov., 1834, and soon afterward withdrew from active political life; devoted himself to scientific agriculture; was many years president of the Smithfield Cattle Club; was one of the founders and the first president of the Royal Agricultural Society 1838; was an active member of the Roxburghe Club for reprinting rare books; and vice-chairman of the Society for the Diffusion of Useful Knowledge. D. at Wiseton Hall, Nottinghamshire, Oct. 1, 1845. See Bagehot, *Biographical Studies* (1881), and Myers, *Lord Althorp* (1890).

F. M. COLBY.

Spencer, JOHN POYNTE, Earl: statesman; b. at Spencer House, London, Oct. 27, 1835; educated at Harrow and Cambridge; entered Parliament 1857, but succeeded to the peerage in the same year; Lord-Lieutenant of Ireland 1868-74; Lord President of the Council 1880; again Lord-Lieutenant of Ireland 1882-85; for a second time Lord President of the Council in the Gladstone administration 1866; First Lord of the Admiralty in the Gladstone government of 1892.

Spencer, SARA (Andrews): reformer; b. at Savona, N. Y., Oct. 21, 1837; educated in high and normal schools in St. Louis, Mo.; was a teacher from the age of sixteen till her marriage in 1864 with Henry C. Spencer. They removed to Washington, D. C., where they founded a Spencerian Business College. In 1871-72 Mrs. Spencer defeated attempts to license the "social evil" in Washington. On Apr. 14, 1871, Mrs. Spencer and seventy-two other ladies in Washington were refused the right to register and vote. She brought suit in the D. C. Supreme Court, and Judge Carter's decision that "women are citizens, but have not the right to vote without local legislation" was reaffirmed by the U. S. Supreme Court in 1874. Mrs. Spencer represented the National Woman's Suffrage Association at the Republican presidential convention in Cincinnati in 1876, addressing the platform committee and the convention; engrossed, signed, and with five other women presented the woman's *Declaration of Rights* at the Centennial celebration in Independence Square, Philadelphia, Pa., July 4, 1876. She was vice-president of the first seven congresses of women 1873-90, representing the District of Columbia; was official delegate from the District to national conference of charities seven years, 1881-88; since the death of her husband in 1891 has been president and proprietor of Spencerian Business College, District of Columbia. She has published *Problems on the Woman Question* (Washington, 1871) and *Thirty Lessons in the English Language* (1873).

SUSAN B. ANTHONY.

Spencer Rifle: a breech-loading magazine-gun, extensively used as an arm for the Union cavalry during the civil war in the U. S. It is characterized by having in the butt of the stock a magazine holding seven cartridges, which are brought one by one into the chamber by a movement of the trigger-guard as a lever, which at the same time throws out the shell of the exploded cartridge. A new magazine can be inserted whenever the cartridges have been exhausted, or the magazine may be shut off and the rifle used as a single breech-loader. See MAGAZINE-GUNS.

Spener, PHILIPP JAKOB: "The Father of Pietism"; b. at Rappoltsweiler, Upper Alsace, Jan. 13, 1635; studied at Strassburg, Tübingen, and Basel, principally theology; became private tutor to the princes Christian and Charles of the Palatinate, and pastor in Strassburg and lecturer in the university in philology and history 1663; was appointed first pastor in 1666 at Frankfort, where he instituted his famous *collegia pietatis* (prayer-meetings), which finally brought him into conflict with the orthodox clergy; became preacher to

the electoral court of Saxony at Dresden in 1696, but lost favor here by reproaching the elector (privately) for his vices; was invited in 1698 to Berlin, where he was appointed professor of the Church of St. Nicola. D. in Berlin, Feb. 5, 1705. He owed his religious views chiefly to English Puritan writers, and neither in his writings nor in his person was there anything of that mysticism and eccentricity which characterized some of his adherents, whose existences were charged falsely upon him. The Pietism which he developed was quite unlike that developed in Halle and elsewhere, which was formal and lifeless. In opposition to the orthodox theological system of his time, he conceived Christianity principally as a living duty and comfort, not as a science; and, leaving all subtle definitions to others, he simply recommended his hearers to look at the Bible in the light of their own lives, and then to look at their lives in the light of the Bible. The impression he made was both wide and deep. He was the object of virulent and persistent abuse and misrepresentation, but the way he bore those attacks was eloquent testimony to the sincerity and depth of his piety. He was a voluminous writer. Perhaps the best of his works are: *Pia theologiae Gedanken* (4 parts, Halle, 1700-05); *Lezte theologische Gedanken* (1711); *Concilium et judicium Theologiae Latinae* (Frankfurt, 1709); *Pia Desideria* (Frankfurt, 1675); *Das geistliche Priesterthum* (1677); *Das thätige Christenthum* (1679); *Evangelische Glaubenslehre* (1699). His *Life* was written by W. Rosebach (2 vols., Berlin, 1828; 3d ed. 1861) and C. A. Wildenbruch (Leipzig, 1842; 2d ed. 1847; Eng. trans. Philadelphia, 1881).

Revised by S. M. Jackson.

Spengel, LEONHARD: Greek scholar; b. in Munich, Germany, Sept. 24, 1801; became privat dozent in the university of his native city in 1827, professor at Heidelberg in 1842; recalled to Munich in 1847, where he died Nov. 9, 1880. Spengel's fame rests upon his work in Greek rhetoric, which field he made especially his own. See his *Zusammenfassung* (1828), an attempt to reconstruct from extant fragments the systematic development of Greek rhetoric; *Rhetores Graeci* (6 vols., new ed. 1858); *Aristotle's Rhetoric* (1844); *Rhetoric of Anaximenes*; *Aristotelische Studien* (4 parts, 1868). He also published, besides many smaller treatises on his favorite subject, an elaborate text edition of Varro's *De Lingua Latina* (now ed. by his son Andreas, 1893). See Burdian's *Biographisches Jahrbuch* (III, pp. 39-50); W. Christ, *Leonhard Spengel* (1881); Ch. Thurn, *Revue de Philologie* (v. pp. 181-180).

ALFRED GUERMAN.

Spenser, EDWARD: poet; b. at East Smithfield, near the Tower, London, England, in 1552. Nothing is known with certainty of his family, but it is almost proved that he was descended from the Spencers of Hurstwood, Lancashire, and was related to the Spencers of Althorp. He was educated at Merchant Taylors' School. He entered as a sizar at Pembroke Hall, Cambridge, May 29, 1569, in which month he contributed a number of sonnets and epigrams to *The Theatre of Worldlings*, a volume printed at London by Dr. John van der Noet, a Flemish physician; graduated Jan. 16, 1573. In 1573 he left Cambridge without a fellowship and visited his relatives in Lancashire, where he fell in love with a lady supposed to have been Rose Denley, whose charms he celebrated under the name of Rosalinde in a pastoral poem, *The Shepherds' Colloquy*, published anonymously in 1579, the dedication of which to Sir Philip Sidney had been preceded by personal acquaintances in London; printed soon afterward *Three Proper and Wittie Familiar Letters lately passed between two Universitie Men* (1580), being a literary correspondence with his college friend, Gabriel Harvey; obtained in the autumn of 1580, through the influence of Sidney, the post of secretary to the Government under Lord Grey of Wilton, Lord-Lieutenant of Ireland; was probably resident in Dublin from 1582 to 1586, when he resigned his clerkship of degrees; his services were rewarded in 1589 by a grant from the crown of an estate forfeited by the Earl of Desmond, consisting of 3,028 acres of land, including the castle and manor of Killeadman, near Doneraile, in the county of Cork, where he resided, and where he completed the composition of his *Faerie Queene*; wrote in 1588 his *Astrophel*, a pastoral elegy on the death of Sir Philip Sidney—not published till 1595; was in 1588 appointed clerk of the council of Munster; received in 1588 a memorable visit from Sir Walter Raleigh on his return from the Lisbon expedition; read to Raleigh the first two books of his great poem, which the latter thought "a dish to set before a queen," and accordingly persuaded the poet to accom-

pany him to London. Spenser's reception by Queen Elizabeth both appears to have been appreciative, for the publication of the first three books of the *Faerie Queene* in 1590 not only placed him in the front rank of poets, but procured him a pension of £20. In 1590 he also published *Monoposia*. During this visit to London Spenser also published in 1591 *Complaints, containing Nondrie Sonnet Poemes of the Worlds Vanitie* (1591), *The Ruines of Time*, *The Teares of the Muses*, and *Prolegomena*. His marriage in 1594 to an Elizabeth, whose surname has not been preserved, inspired his beautiful love sonnets entitled *Amoretti* and a magnificent *Epithalamium* (1595), which were shortly followed by *Colloquy about a come Home Again*. In 1596 he published *The Shepheard's Calendar*, containing the *Fourth*, *Fifth*, and *Sixth Booke*, and *Four Epigrams* addressed to the Countess of Cumberland; he also presented the queen a MS. dialogue in prose, *A View of the State of Ireland*, not published until 1621. Spenser was appointed in 1598 sheriff of the county of Cork, thus incurring the enmity of the insurgents of "the Earl of Tyrone's rebellion," who toward the close of that year burned his house and plundered his estate, forcing him to fly to England, on which occasion an infant child of the poet is said to have perished in the flames. Reduced to poverty, Spenser passed a few miserable months in London, and died in King Street, Westminster, Jan. 10, 1599. According to Ben Jonson, he "died for lack of bread," after having refused twenty pieces (of gold?) sent him by the Earl of Essex, saying that "he had no time to spend them"; these details are revealed by Drummond of Hawthornden. He was buried in Westminster Abbey, near the tomb of Chaucer, as he had desired, the funeral being at the expense of the Earl of Essex; and a monument in his honor was erected in 1630 by Anne Clifford, Countess of Dorset, afterward Countess of Pembroke. He left two sons, Sylvanus and Peregrine. Hugolin, a son of Peregrine, was outlawed for adhesion to James II., and was living, "very old and unmarried," in 1700. Many editions of Spenser's complete works have appeared, the best being the variorum edition of Henry J. Todd (London, 8 vols., 1805), that of J. Payne Collier (London, 5 vols., 1862), with glossary, notes, and a *Life*, and that of Rev. R. Morris (Globe ed., 1889). These were, however, superseded by a critical edition published by the Rev. A. B. Grosart in 1882, with the assistance of a number of eminent English scholars. G. L. Craik's *Spenser and his Poetry* (3 vols., 1845) is a satisfactory critical work. Dean Church's excellent study on this poet was published in 1870. An edition by Prof. Francis J. Child, of Harvard (1885, 1878), is highly esteemed.

Revised by ROBERT GOSSET.

Spess Artem'idos [Gr., grotto of Artemis; Arab. *Stall Antur*, stable of Antar]: an Egyptian rock-been temple dedicated to the local deity, the lion-headed goddess Paebet, whom the Greeks identified with Artemis. It was situated just S. of Bent-Hasan (28° N. lat.), on the east side of the Nile. Apparently it was the work of Thothmes III., but under his cartouches there are traces of an earlier name which has been identified by Golitschew with that of Hattus. The name of Set I. is also found. The grotto is cut from the solid rock, and consists of a vestibule, a corridor, and a rectangular chamber with a naos, at the rear of which is a niche for the image of the goddess. In the vestibule only two of the original eight pillars are now standing. The mural texts are nearly all of a religious character, and there are representations of several deities besides Paebet. The whole is considerably dilapidated.

C. R. G.

Spergula: See SCURLET.

Spermaceti, **Spermaceti-fat**, or **Cetina** [*spermace'tis*, in Mod. Lat.; Lat. *sperma*, sperm + *cetus* = Gr. *cetus*, whale]: a substance ($C_{42}H_{84}O_2$) which exists ready formed in the cavities of the head of the sperm-whale (*Physeter macrocephalus*), and also in that of some other whales and of *Delphinus dentatus*. It crystallizes out of the sperm oil of the head-cavities after the vital heat is lost, forming a magma or microle, from which in cold weather the sperm oil is expressed by hydraulic pressure ("cold-drawn sperm oil"), the spermaceti being left behind. It is purified by melting it by steam in separate mechanical impurities, and recrystallizing. It then forms a lustrous, pearly, white mass of eminent crystalline texture, feeling soft and soapy to the touch; does not grease paper if quite freed from oil. It pure, it is without taste or odor, and has a neutral reaction. The natural product, freed from sperm oil by cold alcohol and repeatedly crystallized from hot alcohol or ether, is the essence of Chervol, which melts at 120°-128°. It yields by sapon-

ification (see FATS) cetyl alcohol and palmitic acid. The ethereal nature of spermaceti was distinctly recognized by Chevreul (*Recherches sur les Corps gras*). Spermaceti was formerly much used in the production of sperm-candles, which are no longer so common as in the prosperous days of the sperm-whale fisheries, the decline of which dates from the general introduction of refined petroleum and paraffin. Spermaceti burns with a bright, clear flame like wax. The standard sperm-candle, which is the common unit of comparison for photometric experiments in Great Britain and the U. S., is taken to burn 120 grains of sperm in an hour, which it rarely does with accuracy. Revised by LEA REMSEN.

Sper'maphytes [from Gr. σπέρμα, seed + φυτόν, plant]: another name for the ANTHOPHYTES (q. v.).

Spermatozo'a [Mod. Lat.; Gr. σπέρμα, seed + ζῶν (plur. ζῶα), animal, living creature]: the male reproductive cells of animals, which by union with the female cell (egg) render the latter able to develop. They consist largely of the cell-nucleus with the addition of other accessory structures to facilitate the union with the egg (impregnation). In shape they vary greatly, but the most common shape recalls the tadpole. In these forms there is a head, composed of the nucleus, followed by a "middle piece," and this in turn by the tail, which may either be thread-like, or may have an undulatory membrane attached to it. Usually the spermatozoa have the power of motion, by means of the vibrations of the tail, but in some forms they are motionless. Recent investigations show that both nucleus and "middle piece" are concerned in impregnation; the tail and analogous structures play no part after the union. J. S. KINGSLEY.

Sperm Oil: See OILS and SPERMACEITI.

Spermophile: any rodent of the genus *Spermophilus*. See PRAIRIE-SQUIRREL.

Sperm-whale: See CACHALOT and PHYSETERIDÆ.

Spessartite: See GARNET.

Speusip'pus (in Gr. Σπυσιππος): philosopher; b. at Athens about 395 B. C.; a nephew of Plato; received the instruction of his uncle, whom he accompanied to Syracuse, and succeeded as president of the Academy. D. at Athens in 339 B. C. Of his writings nothing is left. J. R. S. S.

Speyer, or Speler, sp'fer: city and railway junction; capital of Rhenish Bavaria, at the junction of the Speyerbach with the Rhine (see map of German Empire, ref. 6-D). It has some sugar-refineries and manufactures of vinegar and tobacco, and carries on an active trade in grain, timber, and wine on the Rhine. It is one of the oldest cities of Germany, and in the Middle Ages the German emperors often resided and held their diets here. Nevertheless, it has only one monumental building, the cathedral, erected in the eleventh century, thoroughly restored in 1858, and one of the finest church buildings of Germany. The other great edifices Speyer once possessed were destroyed by the French, who twice conquered and devastated the city. Pop. (1890) 17,585. Revised by M. W. HARRINGTON.

Spezia, spā't'si-ā: town; in the province of Genoa, Italy; beautifully situated on a gulf of the same name in lat. 44° 7' N., lon. 9° 48' E. (see map of Italy, ref. 4-C). The old walls and gates of Spezia have been mostly demolished in the course of the changes necessitated by the rapid growth of the town consequent upon the construction of the naval arsenal. The town is the chief naval station of Italy and is defended by formidable batteries; it has extensive ship-building yards, docks, etc., a foundry, and manufactures of sail-cloth, white lead, cables, and leather. It is the seat of a school of navigation, and is much frequented as a seaside resort. Pop. about 19,860.

Spezzia, spet'si-ā: an island at the entrance of the Gulf of Nauplia, Greece; has a fine harbor; became distinguished in the Greek revolution (1821-29). The inhabitants are mostly engaged in commerce and navigation. Area, 26 sq. miles. Pop. (1890) 5,192. E. A. G.

Sphag'num [Mod. Lat., from Gr. σφάγνυς, a kind of moss]: a large and interesting genus of mosses, many species of which grow in the U. S., mainly in bogs, forming deep, spongy masses, almost always damp. They are called peat-mosses, being the principal ingredient in pure peat. See MOSSWORTS. Revised by CHARLES E. BESSEY.

Sphag'idæ [Mod. Lat., named irregularly from *Sphex*, the typical genus, from Gr. σφήξ, σφῆκος, wasp]: a family of hymenopterous insects, including the so-called sand-wasps and mud-wasps. See HYMENOPTERA.

Sphenis'eidæ: See PENGUIN.

Sphen'odon: See HATTERIA.

Sphenoid Bone [*sphenoid* is from Gr. σφην, wedge + suffix -oid, like]: a bone of the skull, situated in man at the anterior part of the base. It has been likened in shape to a bat with open wings. It consists of a body, four wings, two greater and two less, and the two pterygoid processes. The body is quadrilateral, and hollowed out into a mere shell. This body is conceived to represent the centrum of the third cephalic vertebra (constituting the posterior portion of the sphenoid), joined to the centrum of the second vertebra (the anterior portion). The two greater wings are the neurapophyses of the third vertebra, and the two lesser wings are neurapophyses of the second vertebra. The sphenoid is exceedingly complicated and irregular in its outlines. It is developed from ten centers. It is usually joined anteriorly in the adult to the two sphenoidal spongy bones (a pair of thin, curved irregular plates). Posteriorly, it becomes continuously united to the occipital bone. It articulates with all the bones of the skull and with five of those of the face.

Sphere [(readapted to Latin) < M. Eng. *sphere*, viâ O. Fr. from Lat. *sphæra* = Gr. σφαῖρα, ball, sphere]: a surface all of whose points are equally distant from a point within called the *center*. It may be generated by a semicircle revolving about its diameter as an axis. Any line from the center to a point of the surface is a *radius*, and any line drawn through the center and limited by the surface is a *diameter*: all radii of the same sphere are equal; also all diameters of the same sphere are equal. Every plane section of a sphere is a circle; if the plane passes through the center, the section is called a *great circle*; if it does not pass through the center, the section is called a *small circle*; the radius of a great circle is equal to that of the sphere; the radius of a small circle may have any value from the radius of the sphere to 0, in which case the cutting plane merges into a tangent plane. The surface of a sphere is equal to four great circles, or it is equal to the circumference of a great circle multiplied by its diameter. The surface of a zone, viz., the portion of surface included between two parallel planes, is equal to the circumference of a great circle multiplied by the altitude of the zone. The volume of a sphere is equal to its surface multiplied by one-third of its radius. The volume of a spherical sector is equal to the zone which forms its base multiplied by one-third of the radius of the sphere.

In analysis, the surface of a sphere is a surface of the second order, whose equation in rectangular Cartesian co-ordinates is of the form

$$(x - \alpha)^2 + (y - \beta)^2 + (z - \gamma)^2 = R^2,$$

in which α, β , and γ are the co-ordinates of the center, and R is the radius of the sphere. Revised by S. NEWCOMB.

Spherical Trigonometry: See TRIGONOMETRY.

Sphe'roid [from Gr. σφαῖρα, sphere + suffix -oid, like]: a surface generated by an ellipse revolving about one of its principal axes. If the ellipse revolves about its conjugate axis, it generates a surface resembling a flattened sphere called an *oblate spheroid*; if it revolves about its transverse axis, it generates an elongated surface called a *prolate spheroid*. The surface of the earth is very approximately an oblate spheroid.

Spheroidal State: See HEAT and LIQUIDS.

Spherom'eter: an instrument for measuring the radius of a sphere when only a portion of the spherical surface, as, for instance, a lens, is given. The usual form consists of a vertical screw turning in a socket, which is equidistant from three supporting legs with sharp steel points. Above the sockets the screw has a graduated circular head. The points of the legs are brought in contact with the spherical surface, and the screw is turned until its extremity also touches it. This process is repeated with a plane. Thus the distance between the center of the circle through the ends of the legs and its pole on the sphere is obtained, from which the radius of the sphere can be calculated. R. A. R.

Sphincter [Mod. Lat., from Gr. σφινκτηρ, anything which binds tight, deriv. of σφίγγω, compress, squeeze, bind tight]: in anatomy, a muscle the fibers of which, generally circular, surround some passage in the animal organism, closing the passage, in opposition to certain other muscles called dilators. Some of the sphincters are composed of striped fiber, some of unstriped, and some of both combined. The eyes, pupils,

mouth, rectum, vagina, bladder, and urethra are the most important passages which are provided with sphincters; but there are numerous other sets of circular fibres which have more or less of the action of sphincter muscles.

Sphit'gidae: a family of moths including the hawk-moths. See HAWK-MOTH and LEPIDOPTERA.

Sphinx (Lat. = Gr. *sphynx*, *sphynx*): in Grecian mythology and art, a malevolent being, usually represented as having the head of a woman, the breast, feet, and claws of a lion, the tail of a serpent, and the wings of a bird. It was also represented as having the fore part of a lion, the body of a man, the claws of a vulture, and the wings of an eagle. It was reputed to have originated in Ethiopia. In this latter point there may be an historical reminiscence, but in respect to the features which were combined to form the Greek sphinx there are few items of similarity with the Egyptian prototypes. The Egyptian sphinx proper is composed of the head of a man and the body, legs, feet, and tail of a lion, but it was represented as destitute of wings, except in the period when Greek influence had come to be felt, and its artistic designs to be required. In Egyptian symbolism the sphinx was the guardian of temples and tombs, the incorporation of Ra-Harmachis. The face, however, was sculptured presumably to represent the reigning Pharaoh. It was the form assumed by Ra and Horus when opposed to their enemies, and it was supposed properly to be a quadruped of the desert. Similar figures are frequent in which the human head is replaced by that of the ram (criosphinx) or of the hawk (hieracosphinx); but when applied to these composites the name sphinx is a misnomer, as they are merely variations in the forms given to the deities to whom these animals were sacred. The ram-headed figures and the real sphinx (androsphinx) were, however, used for similar purposes, as they alternate in the "avenues of sphinxes" which mark the passageways from the Nile to the temples. Used thus they were supposed to ward off evil from the dwellings of the gods and of their sacred animals.

There are few, if any, specimens of this style of sculpture from the old kingdom, from the twelfth dynasty there are several, and during the remainder of Egyptian history it was a favorite device. The so-called Hyksos sphinxes from Taxis are of a different type from those found in other parts of Egypt, and also from some other examples found even in Taxis itself. Their bodies are shorter, more sinewy and powerful, and the human heads are also of a different type, with high cheek-bones, broad faces, and powerful features. They are also adorned with manes and shaggy bristles. Several theories have been advanced to account for the variations. It was at first supposed that they were genuine Hyksos remains, produced by foreign artists settled in Egypt; but against this is the fact that the name of Apepi, the Hyksos, is merely scratched upon the shoulder, and does not occupy the place of honor—that it resembles a graffiti rather than an inscription. The main argument rests upon the un-Egyptian cast of feature shown. Mariette proposed this view, and it has heretofore been generally accepted. It has also been suggested that they are productions of a local Egyptian school of sculpture not under the ordinary canon of Egyptian art. Meyer holds that they are memorials of an invading race, which apparently gained the upper hand in Egypt between the ninth and tenth dynasties, of which Khru is the representative. (See Petrie, *History of Egypt*, i, p. 117 ff.) Golenischeff considers that they were memorials of Amenemha III. of the twelfth dynasty (*Bulletin de l'Association*, xv, 121) to whom they bear a striking resemblance. The whole subject, however, is involved in much doubt.

The date of the Great Sphinx of Gizeh, located about half a mile S. E. of the Great Pyramid, is absolutely unknown (see illustration in the article EGYPTOLOGY). It has been assigned to prehistoric times, to the age of Cheops (Khufu), and Khafra of the fourth dynasty, and even to Thothmes IV., but of proof there is none. Fundamental to the whole discussion are two facts—no dated sphinxes earlier than the twelfth dynasty can be proved, and the Egyptian inscriptions of the Old Kingdom do not contain the sphinx-hieroglyphic sign at all, as do those of later periods. The assignment to a period antedating the fourth dynasty rests upon an inscription found in a neighboring temple, which purported to be from the fourth dynasty, but which was really composed in the twenty-first. It alleges that at the earlier date the sphinx was in need of repairs,

but internal evidence points to the probable conclusion that the story is entirely unhistorical. The assignment to Khafra was based upon the fact that a statue of that king was found in the immediate neighborhood. On a pillar in the small temple, between the paws of the figure, was found a tablet of Thothmes IV., in which he is understood to record a dream in which Ra-Harmachis, whose emblem the sphinx was, appeared to him and promised him long life and prosperity if he would clear the figure from the desert sand that had encroached upon it, and repair it. The question of age promises to remain a riddle, and the assignment of it to the time of the Heracleopolite dynasties (ninth and tenth) is only a guess which has something in its favor. It is certain that it was uncovered twice in ancient times, once under Thothmes IV., and once under Ramesses II., but little else is known. Curiously enough, it is not mentioned by Herodotus, though it finds place in other ancient writings. In modern times it has been thrice cleared, by Cavillia, Mariette, and Maspero. When uncovered it was found to be hewn out of the native rock, the head having been carved with great care, but the body left comparatively rough. Breaks or inequalities in the stone were patched with rough masonry, apparently of the Roman period. The whole figure faces eastward, and is about 150 feet long. The top of the head is about 60 feet above the pavement between the paws. The paws are 50 feet long, the head 30 feet long and nearly 14 feet broad. The face was originally colored red, but all traces of the tint have disappeared. It is supposed to have been veneered, in part, at least, with a limestone covering. The face is much damaged and the nose and beard have disappeared. This defacement was largely due to the fact that the Mamelukes used it for a target. The mouth is broad and pleasing, and the face has a benign aspect. It is quite probable that it originally represented the face of the Pharaoh by whom it was cut.

Between the paws of the sphinx is a stone platform approached by a flight of steps, and close to the breast is a small open temple, which is divided into two parts. Three pillars form the rear, and on the central one was the tablet of Thothmes IV., dated from his first year. Another temple is near at hand, which has the general appearance of a tomb or mastaba, and it has been supposed that the sphinx was regarded as the guardian of this building and its contents.

CHARLES R. GILBERT.

Sphinx-caterpillar: See HAWK-MOTH.

Sphyg'mograph (Gr. *sphynx*, pulse, heart-beat + *graphein*, write): an instrument for measuring and recording the shape, frequency, and force of the blood-wave in an artery. It consists of a series of delicate levers set in motion by the pulse-beat, and of a moving surface of paper, on which are recorded the results of the measurement. There are several forms of sphygmograph. They simply amplify on the record the successive changes in the caliber of the blood-vessel. Considerable skill is requisite in working with the sphygmograph. In diseased conditions of the heart its records have a diagnostic value. Revised by W. PETER.

Spice [M. Eng. *spice*, *spice*, from O. Fr. *epicea*, *spice* (> Fr. *épice*): Ital. *spezie* < Lat. *species*, *species*, appearance, kind, wares, goods, spices]: certain aromatic seeds, barks, roots, dried fruits, etc., used in cookery for their flavoring qualities, and in medicine as stimulants and carminatives. Such are cloves, ginger, allspice, nutmeg, pepper, mace, capsaicum, cinnamon, cassia, vanilla, etc. Besides the above, which are extensively exported from tropical countries, and especially from the East, there are others now nearly forgotten, such as cassanuniar, zerumeth, edinary, callawan, and the so-called clove-bark. These have nearly disappeared from general commerce—some because they are inferior in quality, and others on account of their limited supply. Most of the spices are natives of the Old World, but a few are American, and nearly all the important ones are now generally naturalized throughout the tropical world.

Spice Bush: See PEPPER BUSH.

Spice Islands: See MOLUCCAS.

Spiechern, or Speichern: See SAABERBUCKEN.

Spider-crab: See CRAB.

Spiders [M. Eng. *spider*, or *spibre* < O. Eng. **spidre* for **spian-per*; deriv. of verb *spinnan*, to spin]: an order of arachnid animals, the *Araneida*. The chief characters which distinguish them from other groups are the possession of a body divided into two regions, cephalothorax and abdomen,

both without distinct joints, and the latter, which is joined to the former by a slender stalk, bearing spinning manmills on the hinder end. The cephalothorax bears four pairs of legs and two pairs of smaller appendages, the first of which

Orb web spider, *Epeira insularis*.

are the poison-jaws, while the second are curiously modified in the male for reproductive purposes. There are usually eight eyes (sometimes six or fewer) upon the front of the cephalothorax. Respiration is accomplished by lungs or lungs and tracheæ. When lungs alone are present there are two pairs of these organs on the under side of the abdomen. In other forms there is a single pair of lungs, the other pair being replaced by air-tubes like those of true insects.

Spiders are carnivorous, and live upon other insects which they kill by the poison forced through the poison-jaws. They do not eat the prey, but merely suck its juices. Some spiders hunt their prey, jumping upon it like a miniature tiger, but the majority form webs of silken threads covered with a viscid substance. The shape and character of these webs varies exceedingly. In general it may be said that the spider has a lair where he can recognize any vibration of the web, and whence he can rush out to further entangle the prey. The web is secreted by glands inside the body, and as it comes in contact with the air in its passage through the spinning organs it hardens into the familiar thread, which in reality is a cable formed of a number of smaller fibers. Besides its use in forming webs the silk is employed in making nests, as a means of flying, and for the formation of cocoons to contain the eggs. "The males are smaller than the females, and their approaches to the latter are made with extreme caution, as they run the risk of being devoured; extending their pedipalps, they deposit the spermatophores in the female genital aperture and betake themselves to flight" (*Huxley*). In their habits spiders are among the most interesting of animals, well repaying observation. Besides the European works of Thorell and Simon, the student should consult papers by Emerton, *Trans. Connecticut Acad. Science* (1882-84); Peckham, *Trans. Wisconsin Acad. Science* (1888); and McCook, *American Spiders* (3 vols., Philadelphia, 1889-94). J. S. KINGSLEY.

Spie'gel, FRIEDRICH: Orientalist; b. at Kitzingen, near Würzburg, Bavaria, July 11, 1820; studied Oriental languages at Erlangen, Leipzig, and Bonn 1838-42, and at Copenhagen and Oxford 1842-47, and in 1849 was appointed Professor of Oriental Languages at the University of Erlangen. Besides editions of various Persian works and grammars of the Old Persian and Old Bactrian languages, he published *Einleitung in die traditionellen Schriften der Parzen* (2 vols., Leipzig, 1856-60); *Die Altpersischen Keilschriften* (1862; 2d ed. 1881); *Eran, das Land zwischen Indus und Tigris* (1863); *Eranische Alterthumskunde* (3 vols., Leipzig, 1871-78); *Vergleichende Grammatik der alteranischen Sprachen* (1882); *Die arische Periode und ihre Zustände* (1887).

Spiel'hagen, FRIEDRICH: novelist; b. at Magdeburg, Germany, Feb. 24, 1829; studied jurisprudence, and afterward philosophy, philology, and literature at Berlin, Bonn, and Greifswald; taught for some time at the university at Leipzig, and finally devoted himself entirely to literary pursuits. In 1859 he removed from Leipzig to Hanover, where he became literary editor of the *Zeitung für Norddeutschland*; but in 1862 he took up his permanent residence in Berlin. Spielhagen has successfully aspired to treat the great questions of the day in a series of novels distinguished by their artistic composition, their elegant style, and their philosophic thought. The most important of these novels, many of which have passed through numerous editions, are *Problematische Naturen* (1860); *Durch Nacht zum Licht* (1861); *Die von Hohenstein* (1863); *In Reih und Glied* (1866); *Hammer und Amboss* (1869); *Sturmflut* (1877); *Quisisana* (1880); *Angela* (1881); *Was soll das werden* (1886); *Noblesse oblige* (1888); *Der neue Pharao* (1889). In his excellent book *Beiträge zur Theorie und Technik des Romans* (1888), Spiel-

hagen attempts to fix the æsthetic laws which govern the art of novel-writing, and in his autobiography, *Finder und Erfinder* (1890), he gives a charming account of the influences which conspired to make him a novel-writer. An edition of selected novels appeared in 1889-92, comprising twenty-three volumes. JULIUS GOEBEL.

Spilers, ALEXANDER, Ph. D.: lexicographer; b. at Gosport, England, in 1807; graduated at the Universities of Paris and Giessen; settled at Paris 1829; was Professor of English successively at the School of Commerce, at the School of Public Works (Ponts et Chaussées), at the Lycée Bonaparte (1833), and at the University of France; became inspector of colleges; received from Napoleon III. in 1869 the cross of the Legion of Honor in acknowledgment of the value of his series of English grammars, and especially of his standard French-English and English-French *Dictionary* (Paris and London, 2 vols., 1846-49), of which two editions appeared in the U. S.—one edited by G. P. Quackenbos (New York, 1852), the other by J. L. Jewett (1856). D. at Passy, near Paris, France, Aug. 26, 1869.

Spike [from Lat. *spīca*, point, spike, ear of corn, tuft or head of a plant]: in botany, a flower-cluster, of the centripetal or indeterminate order, in which sessile flowers are arranged along an axis. The spadix and ament are varieties of the spike. The ears of wheat and rye are familiar instances of the spike, which in some instances is compound—that is, contains many sessile spikelets. When the flowers are stalked instead of sessile, the spike becomes a raceme.

Spikenard, or **Nard** [*spikenard* is *spike* (see SPIKE) + *nard* < O. Eng. *nard*, from Lat. *nar'dus* = Gr. *νάρδος*; cf. Heb. *nērd*, Pers. *nard*]: (1) in the East the *Nardostachys jatamansi*, a valerianaceous plant of India. Its strong odor is disagreeable to most persons of European and American birth, but it is considered very precious in the East. Its medicinal properties are precisely those of valerian. (2) Roots of various species of valerian are exported from Europe to the Levant under the name of Frankish nard, Celtic nard, and mountain nard. Cretan nard is also the root of a valerian. These are much used in the East as substitutes for the true spikenard. (3) In England the fragrant oil of *Andropogon nardus*, an East Indian grass, is called oil of spikenard. It is used in perfumery. (4) In the U. S. the name spikenard is given to *Aralia racemosa*, and the *A. nudicaulis*, or false sarsaparilla, is called small spikenard. They have each a limited use in domestic medicine.

Spike, Oil of: the volatile oil of the *Lavandula spica*, the broad-leaf lavender of Europe. It has an odor much like that of oil of turpentine. It is used by artists in preparing their varnishes, and by veterinarians as a horse medicine. Much of the commercial oil of spike is an entirely factitious mixture, of which oil of turpentine is the basis.

Spinach, or **Spinage**: the *Spinacia oleracea*, a chenopodiaceous Old World herb, much cultivated in nearly all parts of the world as a potherb, especially for use in the spring. There are about twenty varieties grown in the U. S. Other plants of this and of other genera having similar uses are locally called by this name.

Spinal Caries, or **Potts's Disease of the Spine**: an inflammatory condition of the vertebræ, a spondylitis, destructive in its nature, usually tuberculous in character, and slow in its course. A slight injury is often sufficient to awaken the process in an individual predisposed to struma. Gradual disintegration of the bodies of one or more vertebræ takes place with subsequent bending, which produces a kyphosis or sharp projection backward. The early symptoms are colicky pains in the abdomen (often mistaken for indigestion), reflex pains in the limbs, and a peculiar rigidity of the back in walking and stooping. If the disease is situated in the cervical or upper dorsal regions, an irritative cough is often among the earliest symptoms.

The name Potts's disease was given to this affection from the fact that Dr. Percival Potts, in 1779, was the first physician to describe accurately this special condition of the bones which gives rise to the hunch-back deformity. That this disease existed in prehistoric times is evidenced by the specimens in the Peabody Museum at Cambridge, Mass.

The treatment consists in keeping the diseased bones perfectly at rest until nature throws a bony bridge across the diseased gap and ankyloses the spine. This result may be accomplished by placing the patient continuously in the recumbent posture, or by the application of a steel support, a hard leather or rigid jacket, plaster-of-Paris splint, or other

device. The disease is necessarily long and tedious, its course often extending over many years. Abscesses frequently form in the back or groin, more commonly in the latter situation. The latter condition is known as a psoas abscess, from the fact that the pus follows the sheath of the psoas muscle. When the pus seeks exit in the back, the process constitutes a lumbar abscess.

Paralysis of the lower limbs occasionally results, which though tedious is usually curable, provided extension and fixation are rigidly enforced. Laminectomy is rarely required. See CARES.

DE FOREST WILLARD.

Spinal Column [*spinal* is from Lat. *spina* is, deriv. of *spina*, back-bone, liter.,

FIG. 1.—Lateral view of spine.

FIG. 2.—A vertebra.

Spinal Column. So called from the shape of a vertebra; the backbone, the composite bony column of the back of vertebrate animals which affords attachments, direct or indirect, for the ribs and other bony parts, and for the numerous groups of voluntary muscles. In man it is a flexible column of thirty-three vertebrae united by ligaments, with interposed cartilaginous junctions. The column is from 2 to 24 feet in length, and viewed laterally presents marked curves, which add to the grace and free movements of the trunk. (Fig. 1.) The column is divided into regions—the cervical, dorsal, lumbar, and pelvic—corresponding to the neck, chest, abdomen, and pelvis. The vertebrae, excepting in the pelvic region, rotate freely and flex both antero-posteriorly and laterally. A single vertebra (Fig. 2) consists of the *body*, which unites it to other vertebrae, and a bony ring which encloses the vertebral foramen or vertebral canal, protecting the spinal cord; this ring has articular and spinous processes for attachment of ribs, ligaments, and muscles.

Revised by W. PIERCE.

Spinal Cord: See MEDULLA SPINALIS.

Spinal Curvatures: three kinds—(1) rachitic curvature; (2) lateral curvature; (3) angular curvature. The curvature of rickets (rachitis) is usually a simple exaggeration of the normal curves of the spine—convexity or kyphosis in the dorsal, and concavity or lordosis in the lumbar region; occasionally there is a lateral bending (scottosis), but unaccompanied with the rotation of true lateral curvature. Lateral curvature is a deviation of the spinal column at one or several points from the position which it occupies in health to the median line of the back, accompanied by marked rotation of the bodies of the vertebrae around the axis of the spinal column, which is thus much more distorted in front than behind. It occurs in children, in young, imperfectly developed, feeble, and growing adults; more especially women, and less often in men. The spine normally occupies the middle of the back, with a slight convexity to the right in the dorsal region; in this central position it is acted upon by many forces—the weight of the head and trunk, the lateral traction of the arms in all physical efforts, of the thoracic and abdominal muscles in breathing—and beneath has a divided support of the two lower extremities through the intervention of the pelvis. A lateral curvature may develop connected with any one of these forces; when the tissues are poorly nourished the spine may yield to the weight it supports. Habitual use of one arm to the exclusion of the other may cause deviation of the spine, cervico-dorsal, to the stronger side—a common occurrence in weakly children at school, housemaids, and in some confining mechanical vocations. Disease of one lung, as phthisis, chronic pneumonia, pleuritic adhesions and chest-contraction, by limiting respiratory movement on one side, often causes dorsal curvature to the more active side. Shortening of one limb, hip-joint disease, persistent limping from any cause, by tilt-

ing the pelvis throws the spine out of center and develops lumbar curvature. Whenever a curvature is thus primarily established, a secondary curvature develops at another part of the vertebral column, and as the opposite side, and thus the erect position of the body is maintained. The affected spine, viewed anteriorly or posteriorly, presents a double curvature, a tortuous line whose upper and lower ends can be connected by a vertical straight line, representing the component of all the forces, weight, etc., while the spine sustains. Occasionally there are four curves, two in the dorsal and two in the lumbar region.

Lateral curvature, if of long standing, may so modify the size and conformation of the lung, as change the nutrition and structure of the intervertebral cartilages and the muscular volume of the two sides of the body, that cure is impossible or incomplete. More often it is curable by correcting bad habits, as favoring one side in standing, sitting, or sleeping, by resort to light gymnastics and special passive movements, and by the use of apparatus which removes weight from the spine and applies pressure or traction to counteract the curves. Great advantage may, in early cases, be derived from dividing the period during which the body is erect, by lying flat on the back, without a pillow and on a hard mattress, for at least an hour in the mid part of the day. General tonic treatment, cod-liver oil, and phosphates, out-of-door life, warm clothing, stimulating baths, and regulated diet are indicated in all cases.

Angular curvature, or SPINAL CURVATURE (*q. v.*), is of more serious nature. It may be followed by paralysis of the lower extremities, due to pressure on or inflammation of the spinal cord, but paralysis and abscess do not usually coexist in the same cases.

Spinal Diseases: See MENINGITIS and SPINAL CURVATURES.

Spindler, KARL: novelist; b. at Breslau, Prussian Silesia, Oct. 16, 1796; educated at Strassburg, afterward at Augsburg; was connected for some time with a company of strolling actors; published in 1824 his first novel, *Kugen von Kromstein* (2 vols.); chose literature for his occupation; lived at Hanau, Stuttgart, Munich, and finally at Baden-Baden. D. at Friderichshagen, Baden, July 12, 1855. The best of his novels are *Der Bastard* (3 vols., 1825); *Der Jude* (3 vols., 1827); *Der Jesuit* (3 vols., 1829); and especially *Der Isoldide* (1831). The latter story is an excellent specimen of the early historical novel in Germany, giving a picture of the French Revolution and the subsequent rôle of Napoleon which has not yet been surpassed in fiction. Many of his minor novels were published in a periodical, *Vergangenheitswerk*, which he edited after 1831. A collected edition of his works appeared in 102 vols. at Stuttgart from 1831 to 1854.

Revised by JULIUS GUNZERT.

Spindle-tree, Staff-tree, or Bittersweet Family: the *Celastraceae*; a small family containing 500 species of dicotyledonous, shrubby or tree-like plants, mostly of the temperate and tropical climates, eighteen of which occur in North America. The climbing bittersweet (*Celastrus scandens*) is one of the prettiest woody climbers of the U. S., especially in the winter, when its red-berried seeds remain long in conspicuous clusters. The genus *Euonymus* includes the spindle-trees proper. *E. atropurpureus* is the ornamental shrub known in the U. S. as the wahoo, or burning-bush.

CHARLES E. HENRY.

Spine: See SPINAL COLUMN.

Spinel (Fr. *spinelle*): a mineral, essentially a compound of alumina and magnesia, but with variations and admixtures that give rise to a great variety of colors and tints. It crystallizes in regular octahedrons, sometimes of large size in the black and opaque kinds. The transparent spinels make beautiful gems, especially the deep-red, flame-red, and carmine-colored stones, which are known as ruby spinels, and command high prices, from one-eighth to one-half that of diamonds, the finest having often been erroneously sold for true rubies. The pink variety is known as balasruby or rubicelle, the blue sapphire spinel, the green chrysospinel, the purple almandine spinel. They are also blue, green, yellow, and purple, and even white. The so-called Black Prince's ruby in the English crown is a spinel. The best spinel gems are from Ceylon, Burma, and Siam. H. P. ROSE.

Spinello di Luca Spinelli, called SPINELLO AFRICANO; painter; b. at Arezzo, Italy, about 1380. He was the pupil of

Jacopo di Casentino, and at the age of twenty surpassed his master. It is supposed that in 1347 he was assisting his master to decorate the Church of Santa Maria Novella in Florence with frescoes representing the Virgin and St. Anthony. Of these little remains. Some scenes from the life of St. Benedict, by Spinello, at San Miniato, near Florence, are still in good preservation. These were painted in 1384, when Spinello took refuge in Florence after the sack of Arezzo. Before this date he had decorated many churches in his native city; in San Francesco an *Annunciation* still exists in the chapel of St. Michael. He painted a fantastic composition of the archangel driving Lucifer from heaven, a fragment of which fresco is in the National Gallery, London. This composition was afterward repeated by him for the guild of St. Angelo. In 1361 Spinello painted a panel for the abbey of the Camaldolesi, in the Casentino. The side-frescoes for the altar of Monte Oliveto Maggiore of Chiusi are to be seen in the Ramboux collection at Cologne. In 1387 Spinello was invited to Pisa to work in the Campo Santo there, and painted pictures considered his masterpieces, but now nearly destroyed. He left Pisa on account of political disturbances, and after a year in Florence he returned to Arezzo about 1394. Here he worked, decorating many churches with frescoes till 1405, when he went with his son and assistant, Parri, to Sienna, to paint the series of frescoes still preserved in the town-hall of that city. The last that is heard of him in Sienna is in 1408, after which he returned to his birthplace, where he died in Mar., 1410. For further information, see Vasari (*Le Monner*), vol. ii., and Kugler's *Handbook* (1887).

Spinnet: a musical instrument, stringed and provided with a keyboard; one of the forerunners of the piano, but much weaker, and entirely out of fashion.

Spinner, FRANCIS ELIAS: financier; b. at German Flats (now Mohawk), Herkimer co., N. Y., Jan. 21, 1802; son of a German clergyman; was successively apprentice to a confectioner at Albany and to a saddle and harness maker at Amsterdam, N. Y.; became in 1824 a merchant at Herkimer; was deputy sheriff of Herkimer County 1829-34, and sheriff 1835-37; served in the militia and became major-general; was for twenty years connected with a bank at Mohawk, N. Y., and became its president; was auditor and deputy naval officer of the port of New York 1845-49; Democratic member of the Thirty-fourth Congress 1855-57; was an original member of the Republican party, and re-elected by it to Congress by 9,000 majority in 1856, and again by a similar majority in 1858; was chairman of the committee on accounts 1859-61; was appointed by President Lincoln, on the recommendation of Secretary Chase, to the post of treasurer of the U. S. Mar., 1861; and held the office until July, 1875. During this period his name was a synonym for official integrity, and his curious signature on the "greenbacks" became more familiar in the U. S. than the autograph of any other living man. He was defeated in 1875 as Republican candidate for comptroller of the State of New York. D. at Jacksonville, Fla., Dec. 31, 1890.

Spinning: the art of producing from vegetable or animal fibers an even and compact thread suitable for sewing or weaving. It is one of the most ancient of industries, and is still practiced in many parts of the globe by the spindle and distaff in the same manner that the process is pictured on Egyptian monuments. The distaff, held in the left hand, was a simple stick around which the fiber was loosely coiled; the spindle was a species of top which was set in motion by a twirl of the hand, and by combining its rotary motion with a gradual movement away from the spinner, who equalized the size of the fiber by passing it between the finger and thumb of the right hand until the motion of the spindle was exhausted, when the thread was wound around it, and the process was repeated. The first and most obvious improvement consisted in placing the spindle in a frame and making it revolve by mechanical action of the hand or foot in connection with a wheel and treadle. This constituted the spinning-wheel, which, notwithstanding its simplicity, can not be traced further back than 1530. Modern invention has added little to this implement, the chief improvement being a bobbin for winding the yarn by a motion separate from that of the spindle. See COTTON MANUFACTURES.

Spinning-jenny: the earliest form of spinning-machine in which more than one thread was spun at a time. Cotton, in the course of manufacture, is reduced from the state of the fleecy roll called carding into the state of spun thread by repeated though similar operations. The first

draws out the carding and gives it a very slight twist, so as to make it into a loose thread about the thickness of a candle-wick, in which state it is called a roving or slubbin. The subsequent processes draw out the roving much finer, and

The spinning-jenny.

at length reduce it into yarn. The spinning-jenny, invented about 1764 by JAMES HARGREAVES (q. v.), was not, like Arkwright's spinning-frame (1769), capable of being applied to the preparation of the roving itself. In 1779 Samuel Crompton completed his invention of the mule, which combined in one machine the principles of both the jenny and the frame, and by which the jenny was ultimately superseded. See COTTON MANUFACTURES.

The person operating the jenny turned the wheel with the right hand and with the left drew out from the slubbin-box the rovings, which were twisted by the turn of the wheel. Next a piece of wood, lifted up by the toe, let down a wire, which so pressed out the threads that they wound regularly upon bobbins placed in the spindles. The number of spindles in the jenny was at first eight; when the patent was obtained it was sixteen. It soon came to be twenty or thirty, and as many as 120 have been used. The introduction of the spinning-jenny met with great opposition. In 1779 a mob destroyed the jennies for several miles around Blackburn, and with them all the carding-engines, spinning-frames, and every machine turned by water or horses. The spinning industry was driven from Blackburn to Manchester and other places. Nevertheless, the jenny and the frame revolutionized the cotton manufacture. WILLIAM KENT.

Spínola, AMBROSIO, Marquis de: soldier in the service of Spain; b. in Genoa, Italy, about 1571, son of a wealthy Levant merchant and of a princess of Salerno; took service at an early age under his brother, an admiral in the Spanish navy; participated in the war against the Dutch and English 1588; raised and equipped at his own expense in Spain a numerous corps of veterans, at whose head he proceeded to the Spanish Netherlands 1602; was instrumental in rescuing the Archduke Albert from the superior forces of Prince Maurice of Nassau; became chief commander of the Spanish armies in Flanders 1603; and in the fall of that year took command of the forces around Ostend, which had been besieged for two years. The city capitulated in Sept., 1604. He conducted the war with great ability, but varying success, until the truce of twelve years (1609), which he favored; commanded in the interval the Spanish forces in Germany; took Aix-la-Chapelle, Wesel, and Jülich 1622; was repulsed from Bergen-op-Zoom 1623; captured Breda after a protracted siege 1625; was subsequently commander of the Spanish army in Italy, and captured the city of Casale, Piedmont, but died while pressing the siege of the citadel, Sept. 25, 1630. His death is said to have been hastened by his chagrin at the ingratitude of the Spanish Government in disregarding his pecuniary claims.

Spinoylic Acid: See SALICYLIC ACID.

Spino'za, (BARUCH) BENEDICT: philosopher; b. at Amsterdam, Holland, Nov. 24, 1632; a member of the Spanish-Portuguese Jewish community at that place, then the chief seat of European Judaism. His father, who was a trader, noticing the extraordinary faculties of the son, gave him a good education. Accordingly, he entered upon the customary path of a Jewish scholar, passing through all the steps of the ordinary rabbinistic school, from the elements of He-

view to the holy writings of the Old Testament, thence to the Talmud, the Jewish commentaries, and the scholastic writers of the Middle Ages. Jewish literature led him, through the literature of the scholastics, wherein the Catholic doctrine played so prominent a part, gradually to the portals of the then developing modern views of the school of Descartes. In short, the rabbi Spinoza became a skeptic even as Descartes, the scholar of the Jesuits, had become a skeptic before him. Descartes, however, was enabled to fall back upon Christianity for salvation from skepticism. This Spinoza could not do. Cut loose from Judaism, unable or perhaps traditionally so opposed to it that he did not feel any way inclined to accept Christianity, he was left without any support or guidance. The Jewish God, as the cause and creator of the universe, he had discarded; the Christian conception of God, as the moral harmony and order of the universe, was utterly repugnant to his originally Jewish mind; and thus he had no other recourse left than the so-called pantheism of Substantiality. This capture with Jewish theology brought about a dispute between him and his rabbinistic teachers, which finally led to his expulsion from the synagogue at Amsterdam (July, 1656). Spinoza wrote a protest against the anathema pronounced against him, but otherwise paid little attention to it. He simply changed his name from *Benzion* to *Benedict Spinoza*, by which last name he is generally known, and when he discovered that he was still persecuted by both the orthodox Jews and orthodox Christians of Amsterdam, he retired to the country-house of a friend in the vicinity of Amsterdam, a member of one of the persecuted sects of Protestants of that time, with whom he lived in deep seclusion from 1656 to 1669. He subsequently accompanied him to Rensburg, where he remained till 1664, in May of which year he removed to Voorburg, where he remained in the house of the painter Tydeman till 1669. He then, at the entreaty of his friends, removed in 1671 to Scherdingen, near The Hague, where he remained till his death on Feb. 21, 1677. In personal appearance Spinoza was of middle height; his features were regular and well formed, complexion dark, hair curly and black, long black eyelashes, and, as Leibnitz remarks, "with somewhat of the Spanish in his face." To earn his livelihood he learned to grind optical glasses, and also the art of painting. His mode of living was throughout extremely frugal and secluded. He never married.

The ground of the extraordinary interest taken in Spinoza is to be found in the pantheistic view of the universe which he has carried out in the completest of extant forms in his *ETHICS*. Hence none of the other works of Spinoza claim special notice. Interesting as they may be in connection with the *Ethics*, they have no intrinsic merit of their own. All his few published minor works, as well as his published correspondence, have their central point in the *Ethics*. Students of Spinoza are here referred, first, to the remarks of Goethe concerning Spinoza's philosophical system; second, to the remarks of G. E. Lessing; and, in this connection, third, to the essays of Jacobi on Spinoza and Lessing. Fichte's works are also full of references to Spinoza. Spinoza's view of the universe may be very succinctly described as follows: Adopting the category of substantiality, he altogether abandoned the Jewish conception of a First Cause—a self-conscious Jehovah calling the world into existence by his mere word—and adopted in its place the Oriental notion of an unconscious substance of the universe as a whole, of which all the separate phenomena of that universe—stars, heaven, earth, mankind, animals, plants, and minerals—were but so many attributes. In his scheme there was therefore no God, no Freedom, no Immortality. Whenever he uses the word "God," it is to be interpreted as equivalent to the word "nature" or "universal substance"; when he uses the word "freedom," it is to be understood as the equivalent of "necessity"; and his conception of the word "immortality" means simply that the human soul, after death of the body, will merge again into the infinite substance, wherein no self-consciousness can possibly exist. His God is therefore no God, in the ordinary acceptance of the term; his Freedom, no Freedom; his immortality, the very reverse of what men mean when they say claim to be immortal.

To understand thoroughly the style of the *Ethics*, it must always be kept in mind that Spinoza was a Jew, and that the Jewish tendency of mind betrays itself not only in the subject-matter under discussion, but also and equally in its mode of utterance. The style of all Jewish writers is

abrupt, disregarding transition, and losing above everything parallelisms, as every chapter of the Bible shows. This explains, although seemingly in a paradoxical way, why Spinoza chose what he calls the "geometrical or mathematical" method for his chief work. The opening sentences are as disjointed as the opening propositions of Euclid: the first does not involve the second, nor the second the third, etc.; and none are proven, nor is there any attempt in the whole book to prove any of them. Hence the very fundamental principles of philosophy, about which alone there is any dispute, are at the beginning of the work laid down as axioms; and, what is equally objectionable, at the beginning of each new part of the *Ethics*, of which there are four parts, new axioms are introduced in the same arbitrary, abrupt manner. That the word freedom had no significance to him in its current meaning is abundantly evident from the following extracts that occur in his letters, wherein he is usually a little more outspoken than in his very guardedly worded published works. Taking the example of a stone thrown by some hand, and hence impelled by an external cause: "Now conceive, further, that the stone as it proceeds in its motion thinks and knows that it is striving, so far as in it lies, to continue in motion; then, inasmuch as it is conscious only of its endeavor, and in nowise indifferent, it will believe itself to be most free, and to persevere in its motion from no other cause than that it wills to do so. And this is precisely that human freedom of which all men boast themselves possessed, but which consists of this alone—that men are conscious of their desires, and ignorant of the causes by which these are determined." To remove the last objection, that we might be free at least in thinking, Spinoza adds: "Your friend, however, affirms that we can use our reason with perfect freedom. . . . 'Who,' he asks, 'without a contradiction of his proper consciousness, can deny that he is free to think his thoughts, to write what he pleases, or to leave writing alone?' . . . I, for my part, and that I may not contradict my consciousness—that is, that I may not contradict reason and experience, and yield to ignorance and prejudice—deny that I possess any absolute power of thinking, and that at pleasure I can will, or not will, to do this or that—to write, for example." The same criticism applies to his doctrine of immortality. There are numerous Latin and German editions of the *Ethics*, and of most of the other of Spinoza's works. English translations and expositions of his works are as follows: *Benedict de Spinoza, his Life, Correspondence, and Ethics*, by R. Willis, M. D. (London, 1870); *The Ethics of Benedict de Spinoza* (anon.) (New York, 1876); *Spinoza, his Life and Philosophy*, by Frederick Pollock (London, 1899); *A Study of Spinoza*, by James Martineau (London, 1882); *The Chief Works of Benedict de Spinoza* (2 vols., Bohn's Library, London, 1888); *Ethics*, translated by W. H. White and Amelia H. Stirling (1894). It includes all his correspondence, a very valuable feature. In German, Kuno Fischer's *Geschichte der neuen Philosophie* (vol. I, part 2) is devoted entirely to Spinoza and his antecedents, and is the most satisfactory work extant on this subject.

Revised by W. T. HARRIS.

Spiraea [Mod. Lat., from Lat. *spiraea* = Gr. *εσπερία*, evening, deriv. of *σπείω*, sowing, sowing. So called from the shape of its folioid; a genus of herbs and shrubs of the family Rosaceae, including numerous species, such as hardhack (*S. lamentosa*), queen-of-the-prairie (*S. lobata*), and several other American, besides numerous Old World species, many of them very fine in garden-culture. Some species of *Acetia* (family Saxifragaceae), having somewhat the aspect of *Spiraea*, are cultivated under this name, incorrectly bestowed.

Revised by CHARLES E. BERRY.

Spiral [from Lat. *spiralis*, spiral, deriv. of *spira* = Gr. *εσπερία*, coil, spiral; a curve that may be generated by a point moving along a straight line in accordance with a fixed law, while the line revolves uniformly about one of its points, always remaining in the same plane. The portion generated during one revolution of the line is called a *spire*; the fixed point is the *pole*; and the distance from the pole to any point of the curve is the *radius-vector*. If we take any position of the revolving line as the initial radius, and denote the angle through which the line has revolved by θ , and the corresponding value of the radius-vector by r , the equation of any spiral may be written $r = f(\theta)$. The most interesting spirals are the spiral of Archimedes and the logarithmic spiral. The former is determined by the law that the radius-vector increases uniformly as it revolves, so that the successive spirals intersect it at equidistant points along its length.

In the logarithmic spiral the logarithm of the radius-vector increases uniformly, and the radius-vector itself increases by a constant ratio for every equal increment of the angle of revolution. Thus the distances of the points of intersection from the pole form a geometric progression. At every point of this curve the tangent makes a constant angle with the radius-vector. On the inner side the curve continually approaches the pole, which it only reaches after an infinite number of convolutions. The *Rhumb* (*q. v.*) is a similar curve on the surface of a sphere. Revised by S. NEWCOMB.

Spiral Ducts or Spiral Vessels: See HISTOLOGY, VEGETABLE.

Spirants [from Lat. *spīrans*, partic. of *spīra're*, to breathe]: in phonetics, a class of consonants produced by a friction of the current of breath against the walls of the narrowed organs of the mouth. They are also called fricatives (Germ. *Reibelaute*, *Dauerlaute*, *Schleifer*). Such are *s*, *z*, *sh*, *zh*, *f*, *v*, *p*, *ð*, *ch* (in Germ. *ich*, *ach*), *j*, and to some extent *r* and *l*. They are distinguished from explosives or stops, *p*, *t*, *k*, etc., by being continuous and not momentary. See CONSONANT.

BENJ. IDE WHEELER.

Spire, or Spires: English name of SPEYER (*q. v.*).

Spirillum: See BACTERIOLOGY.

Spirit-duck: a common North American duck (*Charitonetta albeola*). The male has the head very puffy and iridescent, hence the name buffhead. It is an expert diver.

Spiritism: See ANIMISM and RELIGION, COMPARATIVE.

Spirit-level: See LEVELS AND LEVELING and HYPSONETRY.

Spirit-plant: the HOLY GHOST FLOWER (*q. v.*).

Spirit-rapping: See SPIRITUALISM.

Spiritualism [from Late Lat. *spiritualis*, spiritual, of a spirit, deriv. of Lat. *spīritus*, breath, life, spirit, soul (in Late Lat.) ghost, deriv. of *spīra're*, breathe]: the creed of those who believe in the communication of the spirits of the dead with the living, usually through the agency of peculiarly constituted persons called mediums, and also in certain physical phenomena, transcending ordinary natural laws, believed to accompany frequently such spiritual communication, and attributed either to the direct action of spirits, or to some force developed by the medium's own personality.

Revival of Spiritualism.—The elements of the spiritualistic creed are not in themselves new, but are traceable severally to a high antiquity among different races and in widely separated localities, and have usually been associated with some form of religion; they have been revived, though not of conscious purpose, and gathered into one body of beliefs by a movement having its origin as the result of certain incidents which took place at Hydesville, a small town in the State of New York, in 1848.

In March of that year rapping sounds were heard, apparently proceeding from the furniture, walls, and ceilings, of a house in Hydesville, belonging to a family of German descent named originally Voss, a name anglicized into Fox. It was found that these sounds were always perceived in the presence of one or both of the young daughters of Mr. Fox, and that a code of communication could be established by which conversation was carried on with the intelligence supposed to produce them. It was said that in this way evidence was obtained concerning a murder believed to have been committed in the house some time before, and the sounds purported to come from the spirit of the murdered man. Many years after, in 1888, Mrs. Kane (Margaretta Fox) came before the public with a confession that she and her sister had made the sounds with their toes; but before her death she repudiated this confession.

Noted Mediums.—The reported phenomena at the time excited widespread attention in the U. S. and led to the formation of numerous circles of experimenters, where rappings of a similar kind were produced, and supposed communication with the spirits of the dead was established. To the spirit-rappings were added other phenomena, such as table-turning, automatic writing, trance-speaking, etc.; and the persons who developed them received the name of mediums. Mediums, according to the spiritualistic view, are endowed with a special faculty enabling them to be the agents of the communications and other manifestations of spirits. Some show evidence of this gift in early youth, and others gradually develop it in later years. The first medium, after the Fox sisters, was Andrew Jackson Davis, who attracted notice in 1845 as a clairvoyant and later as a trance-

speaker. Judge Edmonds, a well-known lawyer of New York, may also be mentioned; he began an investigation of the subject, became convinced that he was himself in communication with spirits, and wrote an elaborate work on spiritualism. Mrs. Hayden, another native of the U. S., went to England in 1852, and her séances there started the spiritualistic movement which eventually spread over all Europe. In 1855 the celebrated Daniel D. Home also went to England, and later to the Continent. With Home spiritualism reached its highest development, and private and professional séances were established in almost every European town.

Home overshadowed all contemporary mediums, and gained adherents to spiritualism from every intellectual and social class. He was, according to numerous witnesses, equally successful in receiving spiritual communications and in producing physical phenomena, which were witnessed and often severely tested by competent observers. Notable experiments in testing Home's powers were made by William Crookes, by means of apparatus of his own construction, with successful results.

Some years later Slade, and also Eglinton, attracted much attention in Europe by their so-called psychography, or spirit-writing (usually produced on slates), which led to interminable discussion in the press occupied with such matters. The spiritualists attributed this psychography to the spirits, and the non-spiritualists asserted it to be due to conjuring. Slade also gave séances for a variety of spiritualistic phenomena, and achieved special notoriety from a series of sittings with Prof. Zöllner, of Leipzig, who, in *Transcendental Physics*, recorded his belief that the phenomena he had witnessed were due to intelligent "fourth-dimensional" beings.

One of the most noted mediums in England was the Rev. William Stainton Moses, who died in 1892. A full account of his experiences has been published in the *Proceedings* of the Society for Psychical Research. He claimed to receive communications from spirits, both of those recently departed and of personages belonging to remote generations. The list of his physical phenomena, according to his own account and the evidence recorded by the witnesses at his séances, comprised most of those produced by Home and other manifestations as remarkable. Mr. Moses was for several years editor of *Light*, a London spiritualistic periodical, and was, besides, a busy clergyman and school-master of high reputation, and in no sense a professional medium.

In 1892 a series of sittings under unusually stringent if not perfect conditions was held by a committee of Italian savants, among others Schiaparelli, director of the Observatory of Milan, Profs. Gerosa and Brofferio, with a Neapolitan medium, Madame Eusapia Palladino, with the result that several of this committee were convinced of the supernatural character of the phenomena observed, while the others, if not quite convinced, were unable to offer any satisfactory explanation of what they had seen. The phenomena consisted in alterations in the weight of the medium, raps, moving of furniture, and materialization of hands. The séances of Madame Palladino have attracted much attention in Italy, and are remarkable for having influenced the thought of numerous persons of high intellectual standing.

Spiritual Communications.—Spiritualistic communications or messages are received through the automatic writing with pencil or planchette, or trance-speaking of the medium when under spirit-control; by direct writing of the spirits on paper or slates with pencil or chalk; by precipitated writing—that is, writing supposed to be produced on paper without visible means; by table-turning, either with or without contact of the medium, and interpreted by a conventional code; and by raps on the furniture or walls of a room, made intelligible by a code as in table-turning. These communications are supposed to have two objects—one is to convey proof of the survival of the dead, the other to instruct in moral and philosophical knowledge. They are acknowledged by spiritualists to vary greatly in character and in value. Some are merely the expression of the ideas and opinions of the medium himself or of the sitters; some are trivial or false, and are attributed to a low order of mischievous spirits; others, however, it is asserted, are genuine and imply a knowledge of events or of facts beyond the range of the medium or of the inquirers, and proving their supernatural origin.

Physical Phenomena.—The principal so-called physical phenomena of spiritualism are lights, musical sounds, as of

invisible instruments played on or playing of real instruments by invisible or materialized hands; moving of furniture and other heavy objects; the passage of matter through matter, as bringing flowers or other material objects into closed rooms; materializations of hands or other parts of the body or of complete human figures; spirit-photography; and, finally, phenomena immediately affecting the medium, such as levitation or floating in the air without visible support, the elongation or shortening of his body, and fire-tests, when the medium handles live coals and gives them to others to handle without injury, phenomena for which Home was especially renowned.

The object of these phenomena is considered by spiritualists to be the attestation of the genuineness of the communication, and they bear to spiritualistic belief much the same relation that miracles do to revealed religion. Phenomena of undoubted character, like the corresponding communications, are attributed to the lower orders of spiritual beings. All these phenomena do not occur at all sittings or with all mediums, and the latter are often classified according to the predominant character of their special "development." Thus there are writing mediums, trance mediums, materializing mediums, etc. A few, such as Home and Stainton Moses, seem to have been equally successful in every variety of manifestation.

Non-spiritualistic Evidence for "Phenomena."—Count Agénor de Gasparin carried out an elaborate series of experiments in moving tables without contact, a full account of which he published under the title *Des Tables Tournantes*. His circle consisted of himself and his family and a few skeptical witnesses whom he admitted to his sittings. The experiments were made in full light, the members of the circle joining hands and concentrating their will upon the object to be moved, a condition considered by de Gasparin to be essential to success. De Gasparin, evaded the idea of the intervention of spirits in the movements he describes, and attributed them to a mental force capable of acting upon matter without the agency of muscular action. *Des Tables Tournantes* is a body of evidence very carefully recorded, and deserves attentive consideration in connection with the study of these obscure and disputed phenomena. Prof. Barrett and others have also played on record experiments in various phenomena usually called spiritualistic, but in their case not produced in the presence of professional mediums, where, too, the hypothesis of fraud seemed to be a difficult one.

Theories of Apparitions and Materialized Spirits.—A typical belief is that of Allan Kardec, who asserts that the human personality consists of the body, the soul or spirit, and a spiritual body ("périsprit") of a rarefied material, and that after death the spirit can manifest itself to the senses through the périsprit, which by some force of the will or through the agency of the medium becomes visible like vapor condensed under certain atmospheric conditions.

Another theory of the materialization of spirits is that the spirit draws from the medium certain emanations by which it can make itself wholly or in part visible in a temporary reduplication of the medium's body. While materialized the spirit remains in close rapport with the medium, and at the end of the séance or on any sudden disturbance regression takes place—that is, the materialized body at once withdraws into the organism of the medium.

Exposure of Fraud.—Spiritualists acknowledge that many exposures of fraud in mediums have been made. They assert, however, that such fraud is to be expected occasionally in professional mediums, since their living depends upon the production of phenomena and the necessary power is very uncertain. They also say that the trickery is generally of a rather simple kind, and that the genuine phenomena are unmistakable and not to be so explained, and that therefore occasional trickery does not necessarily prove habitual bad faith on the part of a medium.

Spiritualists further contend that numerous exposures have been only apparent, and that much injustice has been done. This view is founded on the theory of repercussion, namely, that the materialized form when disturbed disappears, thus leaving the medium in the exposé's grasp and creating the impression that the medium has himself impersonated the spirit-form.

Relation of Spiritualism to Religion.—Spiritualism is not an independent religion, but its manifestations are regarded by spiritualists as corroborating those ethical teachings of Christ in which all the sects of the Christian religion substantially agree. It does not modify in any specific man-

ner the creeds or dogmas of Christian sects, and among spiritualists are to be found persons of every shade of belief from Roman Catholic to Unitarian. To this general statement one important exception may be made. There is in France a large class of spiritualists who believe that the existence of the soul is one of alternates spiritualism and reincarnation.

The main points of spiritualistic belief, then, as it touches religion are that at death the character undergoes no sudden change, but retains the impress of the actions and thoughts of the earthly life; that the soul values upon a course of steady progress toward improvement; that there are in the other life occupations and interests as in this world; that all work together for the attainment of the perfect life; and that happiness depends upon the degree of moral advancement.

In 1891 there were 364 spiritualistic organizations in the U. S., with 45,050 members.

THOMAS C. FELTON.

Spirocha'ete: See BACTERIOLOGY.

Spir'ula (Mod. Lat., dimin. of Lat. *spira*, coil): a genus of ten-armed dibranchiate cephalopods, of which there are three species, found in most warm seas. They constitute a family, *Spirulidae*, which has interesting relations to the nautilus and the ammonites. The extremely delicate, nautilus-shaped shell is especially common on the New Zealand shores, but the animal itself is very rarely seen in a perfect condition.

Revised by D. S. JOHNSON.

Spit'head: a headland off Portsmouth, England, being the eastern portion of the sea-channel separating the Isle of Wight from the English mainland. (See PORTSMOUTH.) Its security as an anchorage, being protected from all winds except those from the S. E., its contiguity to the great naval establishment at Portsmouth, and its proximity to the coasts of the Continent make it a favorite rendezvous of the British navy. Spithead has been strongly fortified since 1864. Besides the works on the Isle of Wight and on the mainland there are five iron-plated works, built from the bottom, which are among the most remarkable specimens of modern iron-plated fortification.

Spitzberg'en: Arctic archipelago; 400 miles N. of North Cape of Norway; between 76° 30' and 80° 30' N. lat., and 10° and 30° E. lon.; consisting of West Spitzbergen, Northeast Land, Stens Foreland, King Charles Land, Prince Charles Foreland, and many smaller islands. Area, 27,000 sq. miles, with no permanent inhabitants. The islands are mountainous, the peaks often rising between 4,000 and 5,000 feet, and mostly covered with perpetual snow and ice. Only along the shore between the ocean and the mountains are in some places found patches of land, where during the two summer months, when the thermometer rises 10° F. above the freezing-point, the snow melts and a few herbs appear. The mountains contain granite, marble, and coal. Bears, reindeer, and foxes are found, and innumerable whales, seals, and sea-fowl gather along the shores. The islands were discovered in 1523, and visited in 1590 by the Dutch navigator Barentz while seeking a northeast passage to India. The group forms occasionally the base of operations for Arctic expeditions.

Revised by M. W. HANCOCK.

Spitz Dog [used as transl. of Germ. *spitzhund*]: the Pomeranian dog, a small variety which is thought to be a cross between some of the Arctic wolf-dogs and the Arctic fox, like the Esquimaux, Siberian, Lapland, and Iceland dogs, to which, though much smaller, it has a marked resemblance. It is characterized by short and erect ears, a pointed muzzle, a curved bushy tail, and long hair, usually pure white, but sometimes cream-color or even deep black. It is brisk in its movements, useful as a watch-dog, somewhat snappish, handsome, quick of apprehension, and a favorite lapdog in Europe and the U. S.

Spitzka, EDWARD CHARLES, M. D.: neurologist; b. in New York Nov. 10, 1852; M. D., University of City of New York, 1873; studied University of Leipzig 1873; University of Vienna 1874; Assistant Professor of Embryology at Vienna 1874-75; Professor of Medical Jurisprudence, New York Post Graduate Medical School, 1881-82; Professor of Neurology there 1882-84; consulting neurologist St. Mark's Hospital and Northeastern Dispensary; vice-president International Medical Congress at Washington 1887; honorary president Pan-American Medical Congress 1893; author of *Insanity, its Classification, Diagnosis, and Treatment*; articles on *Organic Brain and Spinal Cord Diseases* in Pepper's *System of Medicine*; *The Architecture and Mechanism of the Brain* in Wood's *Handbook of Medicine*; *Insanity in Children* in Keating's *Cyclopaedia*; and numerous professional essays. C. H. THURBER.

Spleen [from Lat. *splen* = Gr. *σπλήν*; cf. Lat. *lien*; Sanskr. *plhān*, spleen]: the largest of the ductless glands of the body. In man, it is situated in the left hypochondriac region, its outer convex surface corresponding with the ninth, tenth, and eleventh ribs, from which it is separated by the descending muscular attachments of the diaphragm; its inner concave surface adjoins the great pouch of the stomach. It also comes near to the pancreas, left kidney, left lobe of the liver, and arch of the colon. It is held in position by a peritoneal reflection from the diaphragm, called the suspensory ligament. It is even more directly related to these adjacent viscera by its blood-supply, the splenic artery being the largest branch of the coeliac axis, the trunk which gives off the nutrient vessels of the stomach, liver, and parts of the small intestine. The variable size and gross and minute structure of the spleen indicate that it is a great vascular reservoir. In health it is 5 inches long, 3 to 4 thick, and 1 to 1½ in breadth, and weighs 7 oz.; it is larger immediately after eating, and in malarial and certain other diseases may weigh 15 or 20 lb., and occupy the abdomen down to the pelvic bones. The fibrous capsule of the spleen is very elastic; it is reflected inward on the vessels as they subdivide, thus forming a system of ramifying partitions, which constitutes the fibrous framework of the spleen. The interspaces of this structure are occupied by the substance of the spleen, a soft, pulpy mass of dark, reddish-brown color, consisting of granular matter, red and white blood-cells, and the Malpighian corpuscles—masses of lymphoid cells closely packed about the terminal arterioles.

The functions of the spleen are not definitely known, but it is certainly the birthplace of both white and red blood-corpuscles. It is active also in the destruction of red corpuscles, but less so than was formerly supposed. It is not an indispensable organ, for it has been removed in animals and men with no serious or marked result. The spleen is frequently congested in the course of infectious diseases, such as typhoid fever, malaria, typhus fever, and the like, and is often permanently enlarged by repeated congestions, infiltration, and hypertrophy of its tissue. There may be supernumerary spleens. The spleen is liable to rupture and fissure from external violence. See HISTOLOGY.

Revised by W. PEPPER.

Splint: a bony growth, generally upon the inside of the fore leg of the horse, below the knee. In young horses it is usually caused by overwork. Rest, poulticing, and packing with cold wet compresses are recommended for the early stages. At a later stage, iodine, mercurial ointment, blisters, and the actual cautery may be usefully employed, but not till the inflammation is gone. If the tendons are interfered with, veterinary surgeons sometimes remove the splint.

Splint: in surgery, a piece of wood, leather, pasteboard, gutta-percha, metal, or other material employed to prevent displacement of the fractured ends of bones or for other analogous purposes. In many cases surgeons use bandages

stiffened with gypsum, starch, dextrine, or gum-arabic in the place, and a very great number of splints have been devised for special purposes in surgery. See FRACTURE.

Splügen: a mountain-pass of the Alps leading from the Swiss canton of the Grisons into Italy over an elevation of 6,946 feet. On the Italian side it is covered at many places with galleries of solid masonry to protect travelers from avalanches. These galleries were built by the Austrian Government, and finished in 1834.

Spofford, AINSWORTH RAND, LL. D.: librarian; b. at Gilmanton, N. H., Sept. 12, 1825; received a classical education by private tuition; became principal librarian of Congress 1865, after having been previously employed in publishing and editing; is member of many historical and philosophical societies; has written much for the press on historical topics. He has published *Catalogues of the Library of Congress: The American Almanac and Treasury of Facts* (1878-89); *The Library of Choice Literature* (1881); *Library of Historic Characters and Famous Events* (1894); and other works. During his tenure of the office of librarian the national collection has grown from 90,000 to about 700,000 volumes, and the change in the law of copyright has been effected by which all copyrights are entered and all facts regarding literary property verified at one central office at the Library of Congress, Washington, D. C., instead of being scattered, as was the case prior to 1870, in the offices of the district clerks throughout the country.

Spofford, HARRIET ELIZABETH (*Prescott*): poet and story-writer; b. at Calais, Me., Apr. 3, 1835; removed at the age of fourteen to Newburyport, Mass.; attended school at Derry, N. H., and early began writing stories for the magazines; married in 1865 Richard S. Spofford, a lawyer of Boston, and subsequently resided at Amesbury, Mass. Among her publications are *Sir Rohan's Ghost* (1859); *The Amber Gods, and other Stories* (1863); *Azarian* (1864); *New England Legends* (1871); *A Thief in the Night* (1872); *Art Decoration applied to Furniture* (1881); *The Marquis of Carabas* (1882); *Poems* (1882); *Hester Stanley at St. Mark's* (1883); *Ballads about Authors* (1887); and *A Scarlet Poppy* (1894). Revised by H. A. BEERS.

Spohr, LUDWIG: composer; b. at Brunswick, Germany, Apr. 5, 1784. His father was a physician. He was early noticed by the Duke of Brunswick, placed on the civil list, and furnished with means for study and travel. His masters on the violin were Maurer and Eck; visited Russia; in 1804 began his professional career in Germany; was concert conductor under the Duke of Saxe-Coburg-Gotha; in 1813 was in Vienna, in 1816 in Italy, in 1817 in Frankfurt and London. A residence of some years in Dresden followed, and continued till he was called to the office of chapel-master at Cassel. D. Oct. 22, 1859. Spohr was possessed of fine sensibility and immense activity. Skillful in construction, elaborate in finish, a master of harmony and instrumentation, poetic in sentiment, imaginative, sympathetic, he ranks with the great, although not the greatest, composers. He was the violinist *par excellence* of his day. His book of instruction for the violin is a standard work. He composed in nearly every style—duos, quartettes, quintettes, sonatas, variations, overtures, cantatas, nine symphonies, five or six operas, several oratorios, songs with pianoforte accompaniments. His most famous pieces are the symphony *The consecration of Tones* and the oratorio *The Last Judgment*, which is rather a collection of musical gems than an evenly developed structure. A vein of mournful tenderness pervading his compositions suggests monotony and mannerism. A critic has said that "if all the works of Spohr could be destroyed except one specimen in each class of composition, it would be of advantage to his reputation."

Revised by DUDLEY BUCK.

Spoils System: in politics, the system of bestowing public offices upon members of the party in power as rewards for political services. See CIVIL SERVICE AND CIVIL SERVICE REFORM.

Spokane: city; capital of Spokane co., Wash.; on the Spokane river, and the Gt. Northern, the N. Pac., the Gr. Railway and Nav. Co., and the Spok. Falls and N. railways; about 15 miles W. of the boundary-line between Washington and Idaho (for location, see map of Washington, ref. 3-J). It is at the falls of Spokane river, and has a very picturesque location. The business portion is built about the falls, with broad streets running N. and S. and E. and W., and some of the residence districts are on higher ground.

The streets are lighted by electricity, and the view from the hill S. of the city is at night particularly striking. Spokane has several public buildings of importance. The city hall is an attractive building of brick and granite, unfortunately located on low ground; the opera-house has a beautiful interior, and capacity of 1,500; the county courthouse is of cream-colored pressed brick, on a slight eminence, and cost \$250,000; and the *Beebe* newspaper building is noteworthy for its symmetrical proportions and beautiful design. The city has an excellent system of drainage, and is now constructing an elaborate system of water-works for 1904.

Churches and Schools.—Spokane is the seat of a bishopric in the Protestant Episcopal Church, and the Jesuits have two or three church buildings, several parochial schools, and a college. The Jesuit missionaries came to Spokane when it was a mere village, and acquired an extensive tract of land, now within the city limits, by which their college has become well endowed. The city has eleven public-school buildings, including a high-school building, ranging in cost from \$15,000 to \$100,000. More than fifty teachers are employed, and there is a daily attendance of about 8,000 pupils. The Sisters of the Sacred Heart maintain a hospital and an orphan home, and the Protestant women have established a House of the Friendless.

Finance and Banking.—In 1894 the city had a property valuation of \$15,500,000 and a bonded debt of \$1,320,000. The receipts from all sources are about \$300,000 per annum and expenditures something less. The tax levy is 11 mills. There are three national banks with combined capital of \$700,000 and surplus of \$75,000.

Business Interests.—The river is not only a source of abundant and superior water-supply, but it has a series of falls over a distance of half a mile as it passes through the city, from which power is obtained to operate about 30 miles of electric street-railway, many mills and factories, an electric-lighting plant, printing-presses, elevators, and small machinery generally. This admirable water-power has made Spokane an important center for the manufacture of flour. The output of the mills is about 2,000 barrels a day, mostly exported to Japan and China.

History.—In 1879 the site of Spokane was occupied by an Indian trading-store and a sawmill. The Northern Pacific Railroad was completed as far as Spokane in 1884, and from that time the place had a rapid growth. It became the chief supply-point for numerous mines of gold and silver in Eastern Washington and Northern Idaho, and a very rich agricultural region to the S. When at the height of its prosperity, in Aug. 1890, it was almost wholly destroyed by fire, the burnt area covering about 60 acres. More than \$6,000,000 was invested in business blocks within two years. During the same period there was a rapid concentration of railways here. The Union Pacific was the second transcontinental line to arrive, and the Great Northern came in 1892. The main lines built numerous branches in all directions from the city, and the Spokane and Northern, an independent road, was built into British Columbia. The result was that at the close of 1892 Spokane had eight railways, and had become one of the most important railway centers of the Pacific coast. In the winter of 1894-95 its citizens gave 1,000 acres of land adjoining the city to the U. S. Government in consideration of the establishment thereon of a large military post, and Congress passed a law in Jan., 1895, creating the post. Pop. (1880) 350; (1890) 19,992; (1895) estimated, 24,000.

JOHN R. KEATY.

Spoleto (anc. *Speltium*): town, in the province of Perugia, Italy; about 60 miles S. N. E. of Rome, on a slight elevation, the crater of an extinct volcano (see map of Italy, ref. 5-K). The old castle, whose foundations date from the time of Theodoric, stands on a height above the town, from which it is separated by a chasm-like ravine spanned by a bridge 640 feet long and 250 feet high, originally Roman, but rebuilt, probably in the tenth century, and now serving as an aqueduct as well as bridge. The old Roman arched gateway, known as the *Porta della Fuga*, is, according to legend, a monument of Hannibal's time. The grand Palazzo Consolare has a tower of the eleventh century. Pop. 7,600.

Spondias: See *HOWERY*.

Sponge-fisheries. These industries which consist in gathering the sponges of commerce, which is the fibrous, spongy framework remaining when the fleshy matter has been washed away from one of the *Ceratopungia*. The softness, and consequent value, of a sponge depends on the

firmness and elasticity of the fibre, and this varies, even in the same species, according to the conditions under which the sponge has lived. The best sponges grow in clear, quiet water from 150 to 200 feet deep, those found where the water is shallow or rather being covered in texture. The principal commercial sponges are *Spongia officinalis*, which includes the toilet-sponges and Turkey sponges of the Mediterranean and the glove-sponges of Florida and the Bahamas; *Spongia* system, containing the horse-sponge of the Mediterranean and the sheep's-walke-sponge, velvet-sponge, and the grass-sponge of American waters; *Spongia asperina*, comprising the *Ammonia* of the Mediterranean and the yellow and hard-head sponges of America. There are numerous varieties of these species, while commercially from fifteen to twenty-five grades are recognized. These range in value from twenty-five cents to \$40 per pound, the fine Turkey sponges being the most expensive. The greater portion of the sponges of commerce, as well as the best qualities, come from the Mediterranean and Adriatic, along the line of coast extending from Genoa, on the northern coast of Africa, to Trieste. Some sponges are also taken in the Red Sea, and large quantities, mostly of the coarser varieties, in Florida and the Bahamas. Good sponges also occur off the Australian coast and at other points in the Pacific, but as yet they have been gathered only for local use.

Methods of Gathering Sponges.—Sponge-fisheries are usually carried on from small rowboats, and where larger craft—ranging from 5 to 50 tons—are employed they are used to transport the boats to the fishing-grounds and to market the catch. The greater portion of the sponges are wrenched from the bottom by a spear with four or five prongs; but, owing to the weight of the handle, this implement can be used only in water under 40 feet deep; beyond that depth divers are employed, or in some localities a dredge. In connection with the spear a water-glass is commonly used, this being a tube of wood or metal 3 or 4 feet long, with an end of plain glass. When this is lowered into the water the bottom can be seen through it plainly. In some localities in the Mediterranean the primitive method is followed of tossing a stone dipped in oil ahead of the boat. There are some variations in the process of preparing sponges for market, but in the main it is as follows: After the sponge has been taken from the sea it is exposed to the air until decomposition sets in, and is then beaten with a stick or trodden under foot in water till the soft parts are removed. In Florida the practice is to place the sponges in pans, where the animal matter decomposes, and is washed out by the tide. After cleansing the sponges are bleached, dried, and baled. The annual import of sponges into Great Britain is about \$1,000,000. The Florida sponge-fishery for 1890 amounted to 366,772 lb., worth \$448,652. Successful experiments have been made in cultivating sponges, but as yet the work has not been carried on on a large scale. Fresh sponges are cut into pieces about an inch square, care being taken to injure the outer skin as little as possible. The cuttings are skewered on bamboo rods, each rod bearing three pieces, and these are attached to boards and sunk in favorable localities. The drawback to sponge-culture is the fact that it requires from three to seven years for a sponge to attain a marketable size; on the other hand, small or ill-shaped sponges, which would otherwise be of little or no use, can be used in this way. F. A. LUCAS.

Sponges [from O. Fr. *sponge* > Fr. *éponge*; Ital. *spongia*; Span. *esponja* < Lat. *spongia* = Gr. *σπγγή*, *σπγγος*]; the members of the group *Spongia* or *Porifera* of zoologists. The sponges are animals of remarkably uniform structure, although varying greatly in appearance. In all forms three layers may be distinguished: (1) a flattened layer of epithelial cells (ectoderm) covering the outer surface; (2) a digestive layer (entoderm) of columnar cells, each with its free end surrounded by a delicate collar, from which projects a whip-like flagellum; and (3) between these two a third layer (mesoderm), in which the skeletal elements and the reproductive cells arise. In the simplest sponges these layers are arranged in the form of a cup, the hollow or cloaca being lined with entoderm, the outer surface covered by ectoderm, the mesoderm being between the two. In other forms the arrangement becomes more complicated. All over the outer surface are minute openings or pores which communicate with canals, and through these water enters the mass of the sponge. In this the canals branch and supply large numbers of chambers (*ampullae*) lined with entoderm, and from these ampullae the water is collected into excurrent

canals and transported through the cloaca to the exterior. In any common sponge the general course of these canals

FIG. 1.—Diagram of a part of a sponge showing the pores and incurrent canals, *i*, communicating with the ampullae, *a*; and the excurrent canals, *e*, leading from the ampullae to the cloaca.

can be traced among the fibers. (See Fig. 2.) In these forms the digestive layer is restricted to the ampullae, while the ectoderm lines all the canals. Nourishment is obtained from minute particles drawn in with the water which is constantly passing through the body.

FIG. 2.—Section of a sponge (*Tethya*) showing the cloaca and the canal system in outline.

greatly among different sponges. Each spicule is the product of a single cell, and is formed on the outer surface of the secreting body. These spicules are of two kinds; in the one they are composed of calcium carbonate, in the other

in the same sponge. The fibers form a continuous network, and are the result of secretion from the ends of numerous cells. Chemically they consist of a peculiar organic sub-

FIG. 4.—Development of a calcareous sponge (after F. E. Schulze): A, early segmentation of egg; B, blastosphere stage (close of segmentation); C, gastrula after fixation; D, young sponge after formation of spicules; *ec*, ectoderm; *en*, endoderm; *p*, incurrent pores; *o*, ostiole; *r*, radial tubes.

stance known as spongin. When spicules and fibers occur in the same sponge the spicules are imbedded in the fibers.

In the mesoderm (the layer which forms the skeletal elements) are the reproductive elements. These consist of eggs and sperm-cells, and it is only after the union of these two that the egg will develop. In the process of development the egg segments (see EMBRYOLOGY), and then, in the forms most studied, one side of the egg pushes into the other, thus giving rise to the embryo known as a gastrula, in which ectoderm and endoderm are differentiated. The gastrula becomes fixed to some solid body, and pores break through the wall, forming the beginning of the incurrent-canal system. Later the excurrent opening or ostiole is formed, and all subsequent changes are the result of partial division or budding from this larva. The skeleton arises early, and in its future growth keeps pace with the general growth of the sponge.

FIG. 5.—*Leucosolenia*, one of the calcareous sponges, and three of its spicules, enlarged.

Various systems of classification of sponges have been advanced. The best seems to be that which divides the group or branch into two classes, *Calcarea* and *Silicea*.

The *Calcarea* (those with calcareous spicules) are all small, marine, and without any economic importance. According to the complication of structure they are subdivided into three orders. Fig. 5 is an illustration of one of the simplest forms.

The great majority of sponges belong to the *Silicea*, in which spicules, when present, are siliceous in character. Some forms, however, are degenerate, and have lost the spicules, while in a few, which form their encrusting sheets, all skeletal structures are absent. Three orders of *Silicea* may be recognized. In the first, or *Hexactinellida*, the spicules are six-rayed, and the resulting skeleton is extremely regular. These forms occur as fossils and in the deeper parts of the ocean, and include the "glass-rose sponges" and that beautiful form termed the "Venus's flower-

FIG. 3.—Different kinds of sponge spicules, enlarged.

of silica; and upon this chemical basis sponges are divided into two classes. Fibers and siliceous spicules may occur

deeper parts of the ocean, and include the "glass-rose sponges" and that beautiful form termed the "Venus's flower-

hakest sponge." In the second order, *Lithospongia*, the sponges are more united by heavy fibers. Here belong the large sponges known as "Nepitum's-cup," and from this group have apparently come those forms without skeleton. The last division, the *Cinnamospungia*, have heavy fibers, while spicules may or may not be present. In this group belong the only fresh-water sponges, several species of which inhabit the rivers and ponds of the U. S. The decay of these frequently injures the water-supply of cities. To this same group also belong the sponges of commerce. For the preparation, etc., see *SPONGE CULTURE*. The literature of the sponges embraces nearly 3,000 titles. The list in 1890 can be found in Lendenfeld, *Systematic Faunas and Classification of Sponges in Proc. Zool. Soc. London* (1890). Important later papers are Vossmer, *Papier*, in *Bronn's Klassen und Ordnungen des Thierreichs* (1887); Schulze, *Hemistellidae*, in vol. xxi. of *Reptology of Challenger voyage*. J. S. KIRKLAND.

SPONSORS [from Lat. *sponsor*, promisor, surety, (in Latin Lat.) *sponsus*, deriv. of *spondere*, *sponsus*, promise solemnly; cf. Gr. *σπονδή*, make a libation to the gods]; in general, those who in any way become surety for another; specifically, one who at the baptism of an infant promises in its name that it shall lead a Christian life; a godfather or godmother. The sponsors also bind themselves to see to it that the child shall receive Christian training. Usually, in the Roman Church, there are two sponsors, a man and a woman, and the relation of godfather or godmother and godchild is held to be a real one, precisely as though it were one of consanguinity. The rule of the Church of England calls for three sponsors, two of whom are of the same sex as the godchild, and no impediment to marriage is created by this relation; the present Anglican rule also permits parents to act as sponsors.

Spontaneity [Mediæv. Lat. *spontaneitas*]: a term used in philosophy to express self-origination. It is sometimes confounded with freedom. Freedom involves not only spontaneity, but also conformity to law or consistency with itself. Mere spontaneity may contradict each act by its successor, and thus its entire series may reduce to zero, thus preventing its realization by external acts. The existence of spontaneity is denied by strict necessitarians, who think all events under the form of causality, making each effect to flow from an external cause; but an examination of the presuppositions of necessity discovers that the ultimate cause—the "intality of conditions"—must be self-determining or spontaneous. Everything that happens must ultimately flow from a spontaneous activity. This spontaneity—all spontaneity—likewise can be shown to be personal will or else dependent on it in the last analysis. Cousin laid much stress in his philosophy upon the spontaneity of reason as contradistinguished from its reflective activity. While reflection depends on the arbitrary will of the individual, and is subject to error, the spontaneous original activity of reason is above reflection and arbitrariness, and not liable to error. Such a theory of reason was applied to the support of a priori ideas upon which the entire system was built. Schelling's "intellectual intuition" and Hegel's "common sense" were used much in the same way; also, "intuition of the reason," which cognizes a priori ideas, according to many contemporary philosophers, corresponds to Cousin's "spontaneity." It is noteworthy that Fichte regarded the philosophic perception of the principles of the true science of knowledge to be a higher order of reflection—as it were, a third intention of the mind (see *Pantheism*), whereas Cousin would make it a first intention. WILLIAM T. HARRIS.

Spontaneous Combustion: combustion which takes place without the application of heat or other means specially designed to promote that end. Lucifer matches have ignited when exposed to the sun's rays, and phosphorus, when in a dry state, has often taken fire at the touch of the hand, on account of its affinity for oxygen. In fact, it is this same readiness to combine with oxygen which causes spontaneous combustion in the case of other bodies, so that anything which will increase it will increase the tendency to such combustion. Mechanical division increases it greatly, by affording a larger surface to the action of oxygen, and by lessening the conducting powers of the bodies acted on. If the oxides of nickel, cobalt, or iron are reduced by hydrogen below a red heat, the resulting finely divided metals take fire when poured into the air; but if heated too highly, they become agglomerated and lose the property, unless

some finely divided powder is present to keep them porous, such as alumina precipitated with the metallic oxides. Freshly burned charcoal is liable to take fire, owing probably to condensation of oxygen in its pores; on this account it is not ground for making gunpowder until it has been kept for a time. Recently expressed fixed oils absorb oxygen and give out carbon and hydrogen; the temperature of heaps of rags, tow, sawdust, and similar bodies soaked with oil, grease, turpentine, varnish, etc., will rise on this account, and the low conducting power of such materials helps the process, until very often the mass takes fire. Serious conflagrations have resulted from this cause. Bituminous coal, especially when containing much pyrites, is liable to spontaneous combustion, when moistened with water. Moisture aids spontaneous combustion also in the case where piles of damp hay or freshly mown grass have taken fire. Barres have probably been burned in this way. Strong nitric acid will not set straw, hay, and such bodies so as to render them spontaneously combustible. Some gases ignite spontaneously, as phosphoretted hydrogen. The illuminating oil distilled from petroleum sometimes gives off gases that inflame spontaneously before it is refined in the "agitator." There are also spontaneously combustible liquids, of which woodyl is an example. (See *PETROLEUM*.) There are a number of alleged cases of spontaneous combustion of the human body, but there is hardly an instance which admits of no other explanation. Liebig considered that the dead body of a fat man, who had been saturated with alcohol, might possibly burn, but that in no circumstances could a body, in which the blood is circulating, take fire.

Revised by H. A. ROBERTS.

Spontaneous Generation: See *GENERATION, SPONTANEOUS*.

Spoonbill: any one of five or six species of wading birds closely related to the ibises, and remarkable for their spoon-shaped bills. The family *Platidae* to which they belong has been divided into two genera: *Alpe*, in which the lower portion of the tarsus is simple, and *Platula* in which it is convoluted. The roseate spoonbill (*Alpe rosea*) of tropical and sub-tropical America, the sole representative of the first-named genus, is from 30 to 36 inches long; the back, wings, and under parts are of a delicate rose color; the lower neck, smaller wing-coverts, and tail-coverts of a rich carmine blue; legs darker. The bill and bald head are varied with tints of green, yellow, and black. This bird occurs in the southern parts of the U. S., but is yearly growing scarcer as it is much sought after. The birds of the genus *Platula*

European spoonbill (*Platula leucorodia*).

are mostly white, and are found in Europe, Asia, and Australia. *Platula leucorodia*, the only species found in Europe, was formerly in some demand for the table. In the U. S. the name spoonbill is often applied to the Stovellian (*q. v.*). The spoonbill sandpiper is *Euryrhynchus pygmaeus*, of Northeastern Asia, occurring occasionally in Alaska. F. A. LAMAR.

Spooner, SORABASHUB, M.D.: author (b. at Brandon, Vt., in 1809; graduated at Middlebury College 1830, and at New York College of Physicians and Surgeons 1835; was a dentist in New York. He was the author of several professional treatises, of *Anecdotes of Painters, Engravers, etc.* (3 vols., 1853), and of a *Biographical and Critical Dictionary*

of *Painters, Engravers, Sculptors, and Architects* (1853; new ed., 2 vols., 1865), containing notices of 12,000 artists. D. at Plainfield, N. J., in Mar., 1859.

Sporades, spor-ă-deez [= Lat. = Gr. *σπορᾶδες* (sc. *νησοι*, islands), liter., fem. plur. of adj. *σποράς*, *σποράδης*, scattered, deriv. of *σπείρειν*, scatter]: those islands in the Grecian Archipelago which are not included in the group of the Cyclades. In a restricted and more accurate sense it includes only the islands near the west coast of Asia Minor between Samos and Rhodes. The more important are Samos, Nicaria, Patmos, Kalymno, Cos, Syme, Telos, Scarpanto, and Rhodes. All belong to the Ottoman empire and are comprised in the vilayet of the Archipelago. The cluster of islands N. of Negropont is sometimes called the Northern Sporades. Seyros, Scopelos, Sciathos, and Halonnesos are the chief. They belong to Greece. E. A. GROSVENOR.

Spore [from Gr. *σπόρος*, sowing, seed, deriv. of *σπείρειν*, scatter, sow]: in botany, a "single cell which becomes free and is capable of developing into a new plant" (*de Bary*). Sachs attempted to limit the term by defining a spore as "a reproductive cell produced directly or indirectly by an act of fertilization," reserving the term *gonidium* for those reproductive cells which are produced without any previous act of fertilization. Bennett and Murray, on the contrary, apply the term to "any cell produced by ordinary processes of vegetation, and not directly by a union of sexual elements, which becomes detached for the purpose of direct vegetative propagation." Adopting *de Bary's* definition, spores in Sachs's sense are sexually produced, or briefly sexual spores, while those of Bennett and Murray are asexual spores.

Many kinds of spores are distinguished by botanists, only the more common of which are noticed here. *Ecidiospores* are cells formed by abstriction in the "cluster-cup" stage of a rust. (See RUSTS.) *Ascospores* are spores formed by internal division of the protoplasm of a cell, termed an ascus. (See ASCOMYCETES.) *Auxospores* are the larger cells occurring in the life-history of diatoms, each the starting-point of a new series of divisions. *Basidiospores* are cells formed by pullulation and abstriction from a cell termed a basidium. (See BASIDIOMYCETES.) *Carpospores* are spores formed in a sporocarp, e.g. in liverworts and mosses. *Chlamydospores* are thick-walled spores formed singly and asexually in the cells of various simple algae and moulds. *Conidiospores*, *conidia*, or *gonidia* are cells formed asexually, usually by abstriction of a little-modified hypha. *Macrospores*, in pteridophytes, are the large spores which upon germination form prothallia-bearing female organs. In anthophytes the embryo-sac is the homologue of the macrospore. *Microspores*, in pteridophytes, are the small spores which upon germination form minute prothallia-bearing antherids. In anthophytes the pollen-cell (pollen-spore) is the homologue of the microspore. *Oöspores* are cells produced by the fertilization of oöspores by antherids. When thick-walled they are often called *resting-spores*. A *sporidium* is a compound spore, or a spore-cluster; each spore in such a structure is known as a *merispore*. A *sporidium* is a small spore abjoined on a promycelium. *Stylospores* are stalked spores; the term is sometimes restricted to those formed in pycnidia. *Teleutospores* are the spores, one to many, formed in the tightly fitting asci of the *Uredineæ*; the term is commonly applied to the asci with their contents. *Tetraspores*, in the red seaweeds (*Florideæ*), are the spores formed in tetrads by the fission of a mother-cell. *Uredospores* are the stylospores of the *Uredineæ*. *Zoöspores* are motile spores, always aquatic. *Zygospores* are cells produced by the union of similar cells; known also as *resting-spores*. See FUNGI. CHARLES E. BESSEY.

Sporezo'a [from Gr. *σπόρος*, seed + (*ζῷον*, animal)]: a class of protozoans the members of which are parasitic in all stages of their existence. They lack all special organs of locomotion, and reproduce by the conversion of the protoplasm of the cell into minute particles or spores, which, frequently passing through an amoeba-like stage, develop into the adults. Four sub-classes are recognized: GREGARINIDA (q. v.), *Amöbosporida*, *Sarcosporida*, and *Myxosporida*, of which only the first contains many species. By many writers the disease known as cancer (*carcinoma*) is regarded as the result of parasitism of sporezoans in the body. J. S. K.

Sports: in general, diversions of the field or of the turf; in a special sense, contests between athletes. Apparently the earliest competitive athletic sports were those of Greece and Rome, from 1,000 to 2,000 years B. C., though the name

athletic is of recent application and in its Greek origin referred only to those who competed for prizes in public games, thus separating into a distinct class the *dymanoi*, who exercised and competed with each other for pleasure or improvement. In earliest times the best citizens competed at the Olympian, Pythian, Nemean, Isthmian, and Panathenæan games, and highest honors were paid to the winners, but a professionalism very similar to that of these times appeared, and the dignity given to the contests was lost. The events open to competition were foot-racing, leaping, throwing the discus, wrestling, boxing, and the pancratium, a combination of boxing and wrestling, and, separate from these, chariot-racing.

When the Romans invaded Britain they brought with them the games of the soldiery, such as jumping, running, hunting, swimming, and combats on horseback. With the advent of the Saxons came skating, hawking, and wrestling, and in the Norman era were introduced the more accomplished arts of the tourney and joust. In the seventeenth century cards, dice, hawking, following the hounds in chase, football, bowling, quoits, wrestling, fencing, shovelboard, shuttlecock, and billiards were of prevalent interest. Bull and bear baiting and cock-fighting came in the eighteenth century, and were popular with people of both sexes. It is interesting to note the revival of football in the eighteenth century, it having been a sport of so much prominence in the early part of the fourteenth century. It was prohibited in England in 1349 because it interfered with the other sports. Falconry, or hawking, has almost disappeared from England, its place being largely taken by fox-hunting. Fox-hunting, so called, is popular in some parts of the U. S., where often the presence of a fox is made unnecessary by dragging a bag of anise seed, which leaves a scent in its trail, over the ground where the hunt (♂) is to take place. The hounds follow this scent readily.

Wrestling, boxing, and pedestrianism have been popular for centuries, but it was not until well along into the nineteenth century that the interest in athletic sports developed into a passion.

The schools and colleges of Great Britain early took active part in organizing athletic clubs. In 1837 the Rugby Crick Run was founded, and Mar. 27, 1858, an annual steeplechase was inaugurated, both at Rugby, and the School Hunt was started at Shrewsbury in 1842.

Oxford and Cambridge met at Christ Church Cricket-grounds, Oxford, Mar. 5, 1864, for the first inter-varsity athletic competition. The events were running 100 yards, 440 yards, and 1 mile; jumping, both for height and distance; hurdling, 120 and 200 yards, and steeplechasing. Each of the competing teams won four of the events.

The first important athletic meeting held in London was that of the Civil Service Athletic Sports at Walham Green, on Apr. 22 and 23, 1864. In 1863 the Mincing Lane Athletic Club was formed, which in 1866 became the now famous London Athletic Club.

From about 1861 the development and spread of athletics all over the civilized world has been prodigious. Since the civil war the U. S. has kept pace with Great Britain, and scarcely a city of 20,000 inhabitants can be found in North America or Great Britain which has not at least one flourishing club for the promotion of general athletics. In Germany and France the same interest is noticeable, and it has developed in a large degree all over Europe, Australia, and the British colonies.

Since 1880 athletics has become a most important feature of scholastic life throughout the U. S., and seems to be substituting itself for the lawlessness exhibited by students in class rushes and hazing affairs. In many institutions of learning the encroachment of organized sports upon purely scholastic occupations has caused some of the governing bodies to place practically prohibitory restrictions on some of the games, most notably upon football.

Professionalism has played a most important part in general athletics, and that part has not in all respects been good, so that very carefully prepared definitions of an amateur have been adopted by practically all amateur clubs in the U. S., Great Britain, Canada, and France, and competitors at the amateur meets are obliged to qualify in accordance with their terms.

In the eastern part of the U. S. the definition of an amateur, as adopted by the Amateur Athletic Union, is generally accepted, and is as follows:

"One who has not entered in an open competition; or for either a stake, public or admission money or entrance-

lose; or under a fictitious name; or has not competed with or against a professional for any prize, or whose admission has been charged; or who has not instructed, pursued, or assisted in the pursuit of athletic exercises as a means of livelihood, or for gain or any emolument; or whose membership of any athletic club of any kind was not brought about or done, and continue because of any mutual understanding, express or implied, whereby his becoming or continuing a member of such club would be of any pecuniary benefit to him; whatever direct or indirect, and who shall in other and all respects conform to the rules and regulations of this organization.

Defection of a Novice.—The sports over which the A. A. U. claims jurisdiction shall be divided into the following classes: Baseball, billiards, bowling, boxing, fencing, football, gymnastics, hurdle-racing, jumping, lacrosse, lawn-tennis, pole-leaping, putting shot, quoits, racquets, rowing, running, sailing, skating, swimming, throwing the hammer, tug of war, walking, and wrestling. An athlete shall be held to be a novice in each of these twenty-four classes until he shall have won a prize in competition in that class open to the members of two or more clubs. The winning of such a prize shall prevent his future competition as a novice in that class, although his entry may have been made before he lost his standing as a novice.

The English Amateur Association has adopted the following definition:

An amateur is any person who has never engaged in, nor assisted in, nor taught any recognized athletic exercise for money, or who has never, either in public or in private, raced or exhibited his skill for a public or for a private stake, or other remuneration, or for a purse or for gate-money, and never backed or allowed himself to be backed either in a public or private race.

A novice is one who has never won a prize in a similar class of competition—i. e. winning a prize for walking would not disqualify for running, and vice versa; but winning a prize for running any distance would disqualify for running. This rule does not apply to school and boys' games.

The Pacific Coast Association is somewhat more liberal in its definition, as are the associations of Canada and France.

Professionals are found in nearly all branches of sport, and while they undoubtedly raise the standard of the sports in that they make the records high, it is a fair question if it would not be better if amateur effort alone set the mark for amateur competitors. Pederstrianism, which was popular with professionals a few years ago, is fast disappearing from all competitions. Walking-matches are no longer popular, and largely because of the difficulty of differentiating a walk from a run. Archery, which was and still is popular in Great Britain, has never been very popular in the U. S. The same may be said of the game of cricket, its place being largely taken by baseball.

Meets of Scottish and Irish clubs are held annually wherever Scotchmen or Irishmen are to be found. The Irish games are very similar to those held throughout the U. S., but the Scotch offer variety in tossing the caber—a log 16 feet long with a diameter of 11 inches at one end and 5 at the other—quoit-putting, and a sword and herring dance. A Scottish winter game called curling is becoming deservedly popular in North America, especially in Canada.

Most of the popular interest in general athletics in the U. S. gathers about the annual meets of the metropolitan and intercollegiate clubs. The records of these meets are annually published in the principal newspapers, and in several almanacs and sporting annuals.

Fishing and hunting will always be popular with sportsmen, and nowhere are better opportunities afforded than in the U. S. and Canada. Stringent game-laws have been passed in most of the States, so that the wanton destruction of game—as evidenced by the entire destruction of the buffalo, and of the pigeon-rocks in Ohio, and of the salmon in many of the Eastern rivers—is no longer possible. The U. S. Fish Commission is restocking lakes and rivers with game fish, and game protective associations are seeing that game-laws are enforced.

For extended accounts of various sports, see BASEBALL, CRICKET, CHAIRING, FOOTBALL, GOLF, LACROSSE, LAWN-TENNIS, RACING, etc.

EDWARD HYTHCOCK, Jr.

Sports, Book of: a proclamation by James I. of Great Britain, issued in 1616, setting forth certain games which might lawfully be indulged in on Sundays after church services. Among the sports allowed were "dancing, archery, leaping, vaulting, May-games, Whitsun-ales, morris-dances, and the setting up of May-poles." It was designed to prevent molestful interferences by Puritanical magistrates with popular recreations. Bear-baiting, bull-baiting, bowling, and "interludes" were forbidden on Sundays. Charles I. renewed the proclamation in 1623. In 1644 the Long Parliament directed that all copies of the *Book of Sports* be burned by the common hangman. In both instances the publication of the *Book of Sports* gave rise to intense excitement, and aroused the strongest opposition among the Puritans. See GOVET, *The King's Book of Sports* (1630).

Spots, Solar: See SUN.

Spotswood, ALEXANDER: governor of Virginia; b. at Tangier, Africa, 1676; was deputy quartermaster-general under the Duke of Marlborough; went to Virginia as governor 1719, and held office until removed in 1739; deputy postmaster-general 1730-39; was the pioneer of iron-manufacturing in Virginia; was originator of an act improving the staple of tobacco, and making tobacco-rotas a medium of common exchange; lent great aid to William and Mary College; was made major-general 1740 and placed in command of an expedition to the West Indies; died at Annapolis, Md., June 7, 1740, before the embarkation took place.

Spotswood, or Spottiswood, JOHN: prelate and historical writer; b. in Scotland in 1597; was educated at Glasgow, and in 1601 went to France as chaplain to the Scottish ambassador. He accompanied James VI. to London in 1604, and in the same year was made Archbishop of Glasgow and a member of the privy council for Scotland; in 1615 was made Archbishop of St. Andrews and Primate of Scotland. Through his influence the Perth Assembly sanctioned the Five Articles (1619). In 1639 he crowned Charles I. at Holyrood, and in 1625 became chancellor of Scotland. He drew great obloquy on himself for the part he took in the examination of John Ogilvie, a Jesuit priest who was apprehended at Glasgow and hanged for refusing to disown the temporal power of the pope, and in the prosecution of Lord Balmerino, who was condemned to death for the crime of "Jesuitism" (verbal sedition), and pardoned only after a long imprisonment. Spotswood, his personal enemy, taking an active part in the proceedings. In 1637 he endeavored to introduce the new liturgy and book of canons into Scotland, urged on by the king and Laud, and, as is said, contrary to his own wish. Removed from the chancellorship by King Charles, deposed from his bishopric by the assembly convened at Glasgow in Nov., 1638, excommunicated, and declared infamous, he fled to London, where he died Nov. 26, 1639. He wrote a *History of the Church of Scotland* (published in 1635), the greater part of which treats of the history of his own times. Among his other writings is a Latin treatise (*Refutatio Libelli de Negamine Ecclesie Scotice*), written in answer to a tract of Calderwood's, published in 1620. His *Life* was written by Bishop Duplex and by Bishop Russell, the latter prefixed to the Spotswood Society edition of his *History of the Church of Scotland*.

Spottsylvania Court-house, Battles at: See WILDERNESS.

Sprague: town; capital of Lincoln co., Wash.; on the Northern Pac. Railroad; 42 miles S. W. of Spokane (for location, see map of Washington, ref. 4-J). It is in an agricultural and stock-raising region, is the trade-center of the Big Bend country, and contains railway machine-shops and car-works that cost \$250,000, a national bank with capital of \$50,000, and a daily and three weekly newspapers. Pop. (1890) 1,280; (1894) estimated, 2,000.

Sprague, CHARLES: poet; b. in Boston, Mass., Oct. 26, 1791; educated at the Franklin School, Boston. He entered mercantile life at the age of thirteen and was cashier of the Globe Bank from 1825 to 1865. He wrote prose prologues for the opening of theaters and delivered 4. B. R. poems, centennial and anniversary odes, and other occasional pieces, the best known of which is his *Shakespeare Ode*, recited at the Boston theater in 1823. A collected edition of his writings in verse and prose was published in Boston in 1841 (revised editions in 1850, 1855, and 1876). D. in Boston, Jan. 14, 1875.
H. A. BEANS.

Sprague, WILLIAM BURELL, D. D., LL. D.: geographer and annalist; b. at Andover, Conn., Oct. 10, 1795; graduated

at Yale College 1815; studied at Princeton Theological Seminary 1816-19; was colleague with Dr. Lathrop over the Congregational church of West Springfield, Mass., 1819-21, and pastor 1821-29; pastor of the Second Presbyterian church of Albany, N. Y., 1829-69; visited Europe in 1828 and 1836; engaged exclusively in literary work at Flushing, L. I., 1869-76. D. at Flushing, L. I., May 7, 1876. Dr. Sprague was a preacher and public speaker of special eminence; made a collection of autographs (nearly 100,000 in number) and religious pamphlets, presenting the latter to the New York State Library; won the title biographer of the Church by his most important publication, begun in his fifty-seventh year, *Annals of the American Pulpit*, sketches of the most prominent clergymen of all denominations from the earliest dates to 1855 (10 vols., New York, 1857-76); and among other works *Letters to a Daughter* (New York, 1822; republished under the title *The Daughter's Own Book*); *Letters from Europe* (1828); *Lectures on Revivals* (1832); *True Christianity and other Systems* (1837); *Life of Rev. Edward Dorr Griffin, D. D.* (1838); *Letters to Young Men* (1845); *Women of the Bible* (1850); *Visits to European Celebrities* (1855); and *Life of Rev. Jedidah Morse* (1874). C. K. HORT.

Sprain, or **Subluxation** [*sprain* is deriv. of *sprain* (verb), from O. Fr. *espreindre* > Fr. *épreindre*, press, wring < Lat. *exprimere*, press out; *ex*, out + *primere*, press. *Subluxation* is from *sub-*, partially + *luxation*, from Lat. *luxare*, dislocate]: a stretching or wrenching of the non-osseous parts of a joint, without displacement of the bones, and either with or without lesion of ligaments or tendons. Severe sprains are sometimes as serious and lasting in their effects as dislocations, especially on account of the liability of the patient to attempt to use the part before the inflammation has wholly subsided. Perfect rest, cold or sometimes hot lotions (if the latter be more agreeable to the patient), accompanied by the use of splints for mechanical support and of opiates for the relief of pain, are required in the treatment. Revised by W. PEPPER.

Sprat, or **Garvie**: the *Harengulus sprattus*, a little herring of the European seas. Sprats are spiced, salted, dried, and potted in many ways, and are very good when fresh, but are generally eaten by the poorer classes. The French preserve great quantities of small sprats and sell them for sardines. Great quantities are also used for fertilizing land. The sprat is seldom over 6 inches long.

Sprecher, SAMUEL, D. D., LL. D.: theologian; b. near Williamsport, Md., Dec. 28, 1810; studied in Pennsylvania College and Theological Seminary, Gettysburg, Pa.; pastor at Harrisburg, Pa., 1836-39; principal of Emmaus Institute, Middletown, Pa., 1839-42; pastor Martinsburg, Va., 1842-43, and Chambersburg, Pa., 1843-49; president of Wittenberg Theological Seminary Springfield, O., 1849-74. He combined with it until 1884 the chair of Systematic Theology. Removing to the Pacific coast, he filled for a time the presidency of the college at San Diego, Cal. Dr. Sprecher's chief book is his *Groundwork of a System of Lutheran Theology* (Philadelphia, 1879). H. E. JACOBS.

Sprée, *sprā*: a river of Prussia; rises in the kingdom of Saxony, passes through Berlin, and joins the Havel at Spandau, after a course of 220 miles. At Leibsch it becomes navigable for small craft, and considerable traffic is carried on along its whole course.

Sprengel, HERMANN JOHANN PHILIPP, Ph. D., F. R. S.: chemist; b. at Schillerslage, Hanover, Germany, in 1834; studied at the Universities of Göttingen and Heidelberg, from the latter of which he took his degree in 1858 with the highest honor; moved to England 1859; discovered and described in *The Journal of the Chemical Society*, 1865, the method of producing vacua by the fall of water or mercury in tubes. He first drew attention to picric acid, which he suggested as a detonating charge for shells; and was the first who described and patented in England a number of so-called safety-explosives, among which are hellhoffite, oxonite, panclastite, rackarock, etc. Hellhoffite and rackarock were used by Gen. John Newton in blowing up Flood Rock at Hell Gate. C. H. THURBER.

Sprengel's Air-pump: See PNEUMATICS.

Sprenger, ALOYS: Orientalist; b. at Nassereut, Tyrol, Sept. 3, 1813; educated at Innsbruck and Vienna (1832); went to London (1836) to assist the Earl of Munster in his work, *The Military Sciences of the Mohammedan Nations*; then to Calcutta (1843) and became (1845) president of the College of Delhi, where he introduced European methods

of teaching, established a lithographic press, and issued a penny magazine, *Kiran Aladain*; was assistant resident at Lucknow (1848), where he catalogued the royal library; examiner at the College of Fort William (1850); head of the Calcutta and Hugli Mohammedan Schools; Government interpreter and secretary of the Asiatic Society of Bengal. He was pensioned in 1857, returned to Europe, and became Professor of Oriental Languages at Berne. D. Dec. 19, 1893, at Heidelberg, to which place he had retired. His most important work is *Das Leben und die Lehre des Mohammed* (Berlin, 1861-65, 3 vols.), the most comprehensive life of the prophet by a European, but written too much from the point of view of a physician. Of his *Bibliotheca Indica*, which he published in conjunction with other scholars, may be mentioned: *Dictionary of the Technical Terms used in the Sciences of the Mussulmans* (Calcutta, 1854); *Ibn Hajar's Dictionary of Persons who knew Mohammed* (1856); *Soyuti's Itkân* (1856), etc. He also published *Otby's History of Mahmud of Ghaznah* (Delhi, 1847); *Masudi's Meadows of Gold* (London, 1849); *Die Alte Geographie Arabiens* (Bern, 1875). RICHARD GOTTHEIL.

Spring [liter., origin, source, beginning, time of beginning (cf. *dayspring*), deriv. of *spring*, to arise, take birth, rise, or origin]: the season of the year which follows winter and precedes summer. In the temperate regions of the northern hemisphere it includes, in a vague and indefinite way, the months of February, March, and April (as in Great Britain), or March, April, and May (as in North America); astronomically, it would extend from Mar. 21 to June 21. In the temperate regions of the southern hemisphere the spring months are September, October, and November. In the tropical regions there is strictly neither spring nor autumn, but only two seasons, the wet and the dry; in the polar regions, only two seasons, summer and winter.

Spring, GARDINER, D. D., LL. D.: clergyman; b. at Newburyport, Mass., Feb. 24, 1785; was valedictorian at Yale College 1805; studied law and taught in New Haven 1805-06; established an English school and taught in Bermuda 1806-08; admitted to the bar 1808; studied theology at Andover Theological Seminary 1809-10; and was pastor of the Brick church (Presbyterian), New York, 1810-73. D. in New York, Aug. 18, 1873. Many of his publications have passed through several editions, and have been reprinted and translated in Europe. They include *Essays on the Distinguishing Traits of Christian Character* (New York, 1813); *Memoir of Rev. Samuel J. Mills* (1820); *Fragments from the Study of a Pastor* (1838); *Obligations of the World to the Bible* (1839); *The Attractions of the Cross* (1846); *The Bible not of Man* (1847); *Discourses to Seamen* (1847); *The Power of the Pulpit* (1848); *The Mercy-seat* (1850); *First Things* (2 vols., 1851); *Contrast between Good and Bad Men* (2 vols., 1855); *Pulpit Ministration* (2 vols., 1864); and his autobiography, *Personal Reminiscences of the Life and Times of Gardiner Spring* (2 vols., 1866). The *Memorial Discourse*, by Rev. John O. Murray, D. D., has been published (New York, 1873). C. K. HORT.

Spring, LEVERETT WILSON, A. M., D. D.: teacher and author; b. at Grafton, Vt., Jan. 5, 1840; graduated at Williams College 1863, at Hartford Theological Seminary 1866; pastor of Rollstone Congregational church, Fitchburg, Mass., 1868-75; pastor of Plymouth church, Lawrence, Kan., 1876-81; Professor of English Literature, University of Kansas, 1881-86; Morris Professor of Rhetoric at Williams College since 1886; author of *Kansas* (in the American Commonwealth Series); *Mark Hopkins, Teacher* (1885). C. H. T.

Spring-bok [Dutch for spring-buck, so called from its habit of leaping when alarmed]: a very beautiful, active, and graceful antelope of South Africa, the *Gazella eucorpe*. It goes in immense herds upon the plains. Its flesh is in some estimation as food, and the hides are much sought for by tanners. This timid creature, when taken in hand young, becomes very tame and sportive.

Spring City: borough; Chester co., Pa.; on the Schuylkill river, the Schuylkill Canal, and the Penn. Railroad; opposite Rogersford, 32 miles N. of Philadelphia (for location, see map of Pennsylvania, ref. 6-1). It has manufacturing of wood-pulp, stoves, glass, stove-moulders' facing, fire-brick, tile, paper, sash, and lumber, a national bank with capital of \$200,000, and a weekly newspaper. Pop. (1880) 1,112; (1890) 1,797.

Springer: a name given by sportsmen to several varieties of the hunting spaniel, used for starting birds from

hazily reverts. The Clumber, Snow, and Norfolk breeds are the best. The springer should weigh from 34 to 40 lb., and should have a good coat, a bushy tail, carried low, and an active, graceful style of work. The Clumber is especially liked, because it gives no tongue while at its duty.

Springfield, city; capital of the State of Illinois and of Sangamon County; on the Balt. and Ohio R. W., the Chi. and Al., the C. & P., Peoria and St. L., the Ill. Cent., the St. L., C. & N. W., and the Wabash railways; 3 miles S. of the Sangamon river, and 185 miles S. W. of Chicago (for location, see map of Illinois, ref. 5-11). It lies on the western border of an undulating prairie stretching from near the river to the timbered lands that line its tributaries on the E. The city proper is 3 miles square, and surrounded by an avenue 80 feet wide. It is laid out on a simple plan, the streets and avenues intersecting each other at right angles, and the residence portions being ornamented with shade-trees; it contains two public parks (Reservoir and Forest) and several fine squares. The city is lighted by gas and electricity, and its street-railway system is operated by electricity. It has excellent water-works, a complete system of sewerage, a paid fire department, and is one of the best-paved cities in the State.

Public Buildings.—The most conspicuous of the public buildings are the new State house, the U. S. court-house and post-office, the county court-house, the Governor's mansion,

State house, Springfield, Ill.

the State arsenal, and the city-hall. The new Capitol, completed in 1857, stands in a park of about 8 acres, at the southwest corner of Second and Monroe Streets. The ground-plan is in the form of a large cross, and the superstructure is of the modern classic style of architecture. The extreme length from N. to S., including the northern portico, is 379 feet, and the extreme width from E. to W., including the eastern portico, is 286 feet. The exterior walls are of dressed Julius limestone, and the large and lofty porticoes of sandstone, supported by columns of polished gray granite. The edifice is three full stories in height, with a mansard roof and two towers. Over the center rises a stately dome, surmounted by a lantern and iron flagstaff, reaching a total altitude of 964 feet. The whole cost of the building was over \$4,000,000. The county court-house (formerly the old State house), the corner-stone of which was laid July 4, 1837, occupies the center of the public square in the heart of the city. It is a massive structure, built of solid limestone in the form of a rectangle, being longest from E. to W. This edifice is two stories high, with a basement, and is surmounted by a handsome dome. The total cost was \$240,000. The U. S. court-house and post-office stands on the Government block at the intersection of Sixth and Monroe Streets. It is built of Knoxville stone, three stories high, and was completed in 1895 at a cost of \$320,000. The Governor's mansion and grounds occupy an entire block in the southern part of the city. The mansion is a fine and imposing brick structure. The city-hall is built of cream-colored brick with stone trimmings, four stories high, and is a conveniently

arranged and stately building. Here is located the public library, containing 35,464 volumes.

The Lincoln Monument.—Among the chief historical attractions of Springfield are the Lincoln residence and the Lincoln national monument. The latter stands in Oak Ridge Cemetery, about 14 miles S. of the new city-house. This monument contains the remains of President Lincoln, his wife, two of his children, and one grandson. It was designed by Larkin H. Mead, of Vermont, and was built by William D. Richardson, of Springfield, Ill. The exterior

The Lincoln residence, Springfield, Ill. (belongs to the State.)

walls of the terrace, pedestal, and shaft are faced with Massachusetts gray granite, and the total height of the monument is 98 ft. 5 in. It was dedicated Oct. 10, 1874. The whole cost, including the statue of Lincoln and four groups of bronze statuary, was about \$225,000.

Churches and Schools.—The churches and mission chapels of the city and suburbs number 38, classified as follows: 4 Protestant Episcopal, 5 Roman Catholic, 4 Lutheran, 5 Baptist, 5 Methodist Episcopal, 6 Presbyterian, 11 Congregational, 1 Cumberland Presbyterian, 1 Christian, 1 Hebrew, 1 United Brethren, 1 Seventh-day Advent, and 1 Salvation Army barracks. The public schools consist of a central high school and 10 large ward-schools. The money expended for public-school purposes for the fiscal year ending Feb. 28, 1894, was \$56,351. Besides the public schools there are Gamardin College (Lutheran), the Rutledge Institute, St. Agatha's School, the Ursuline Convent, the Convent of Our Lady of the Sacred Heart, and half a dozen parochial schools. Among the

National Lincoln Monument, Springfield, Ill.

charitable institutions are the Home of the Friendless and the Orphanage; also three hospitals—St. John's, the Wabash Railway, and the Prince Sanitarium.

Finance and Banking.—The gross receipts of the corporation for city purposes for the fiscal year ending Feb. 28,

1894, were \$314,799; the bonded debt on Mar. 1, 1894, was \$902,350; and the estimated value of all property belonging to the city \$925,000. In 1895 there were 5 national banks with combined capital of \$1,050,000, 1 State bank with capital of \$100,000, and 1 loan and trust company with capital of \$100,000. There are also 10 building and loan associations, all serial, 1 national, 9 local, with 4,088 shareholders and 41,659 shares in force.

Business Interests.—The census of 1890 showed 374 manufacturing establishments (representing 63 industries), with a combined capital of \$3,641,415, employing 3,269 persons, paying \$1,746,228 for wages and \$3,789,139 for materials, and turning out products valued at \$6,562,070. The principal industries, according to the amount of capital invested, were those connected with the building trades, 102 establishments, \$558,573 capital; printing and publishing, 12 establishments, \$261,031 capital; textiles, \$257,215 capital; foundry and machine-shop products, \$202,837; planing-mills, \$58,500 capital. The city is also an important coal-mining center.

History.—Springfield was settled in 1819 and platted in 1823, when it became the county-seat. It was incorporated as a town Apr. 2, 1832, and as a city Apr. 6, 1840. By acts of 1837 it was made the permanent seat of the State government, and the first session of the Legislature held here was convened Dec. 9, 1839. Pop. (1880) 19,743; (1890) 24,963; (1895) estimated, 30,000. JOSEPH WALLACE.

Springfield: city; port of entry; capital of Hampden co., Mass.; on the Connecticut river, and the Boston and Albany, the N. Y. and New Eng., and the N. Y., N. H. and Hart. railways; 98 miles W. by S. of Boston, and 138 miles N. N. E. of New York (for location, see map of Massachusetts, ref. 3-E). The city is beautifully situated, is laid out with wide streets, adorned with fine shade-trees, and is noted for the variety and taste of its private dwellings and the beauty of its churches and public buildings. There are two parks—Forest, comprising over 500 acres, laid out with ponds, carriage roads, and promenades, and Hampden, containing about 60 acres, famous for its horse-races and cycling tournaments. The steam-railways entering the city use a union dépôt erected in 1889 at a cost of \$500,000. A street-railway connects the extreme sections of the city and also extends to Chicopee, West Springfield, and Holyoke.

Churches and Schools.—Springfield has 39 churches, of which 11 are Congregational, 7 Methodist Episcopal, 3 Roman Catholic (also a mission), 5 Baptist, 3 Union, 2 Protestant Episcopal, and 1 each Unitarian, Universalist, Advent, Swedenborgian, Presbyterian, Lutheran, Jewish, and Spiritualist. The public-school system comprises a high school and 11 grammar, 12 primary, 7 ungraded, 3 evening, 3 kindergarten, 1 manual-training, and cooking and drawing schools, located in 31 buildings, and having 231 teachers and over 7,000 pupils. Various parochial schools have over 1,200 pupils, and private schools over 100. The city also contains a French-American (Protestant) college, the School for Christian Workers, and the International Y. M. C. A. School. The Public Library building is one of the finest in the city, and besides a library of about 89,000 volumes contains a free reading-room and a museum of natural history and ethnology.

Finances and Banking.—The city has an assessed property valuation of over \$56,000,000 and a funded debt of \$1,930,000, of which \$1,650,000 is water debt; deducting assets, including sinking funds, there is a net debt (1895) of \$1,577,562. The receipts and expenditures are nearly equal, over \$1,600,000 in each case. In 1895 there were 10 national banks with combined capital of \$3,500,000, 3 savings-banks with aggregate deposits of \$18,667,430, a co-operative bank with a capital of \$333,000, 2 safe deposit companies, one with a capital of \$300,000, a bank clearing-house, which in 1894 cleared \$65,033,128, and 5 insurance companies.

Business Interests.—The census returns of 1890 showed 681 manufacturing establishments (representing 107 industries), with a combined capital of \$10,524,457, employing 9,510 persons, paying \$5,391,005 for wages and \$7,583,487 for materials, and turning out products valued at \$16,191,456. The city has a great variety of skilled industries, extensive manufactories of railway-cars, pistols, sporting-arms, cotton and woolen goods, paper, envelopes, paper boxes, and collars, toys, needles, watches, buttons, skates, machinery, knit goods, confectionery, corrugated iron, paints and chemicals, sewing-machines, etc. The U. S. armory is located here and gives employment to about 530 men. Large additions

have been made to the shops and machinery, and the output of rifles is 100 a week. The arsenal is 200 by 70 feet, and accommodates 300,000 stand of arms. The U. S. Government building, completed in 1891 at a cost of about \$150,000, contains the post-office and the customs-office. The value of the imports in 1893 was \$107,718, and for the first quarter of 1895 nearly \$50,000, and the duty collected in 1893 \$47,710. The city has a flourishing board of trade. There are 4 daily, 8 weekly, 8 monthly, 2 semi-monthly, and 2 Sunday periodicals.

History.—Springfield was settled in 1636 by emigrants from Roxbury under the leadership of William Pynchon, and was first called Agawam, the Indian name for a portion of the territory occupied. West Springfield, Chicopee, and several of the neighboring towns were then included in its boundaries. In 1640 the name of the settlement was changed to Springfield in compliment to Mr. Pynchon, whose country residence in England bore that name. In 1675, during King Philip's war, the town was burned by the Indians. During Shays's rebellion in 1787 the U. S. arsenal was attacked, but the insurgents were dispersed by the State militia. Pop. (1880) 33,340; (1890) 44,179; (1894) 51,851. ERNEST M. LONG.

Springfield: city; capital of Greene co., Mo.; on the St. L. and San Fran., and the Kan. City, Ft. Scott and Memphis railways; 130 miles S. of Jefferson City, the State capital, and 240 miles W. S. W. of St. Louis (for location, see map of Missouri, ref. 7-F). It is on one of the highest plateaus of the Ozark Mountains, 1,450 feet above sea-level, is built in a grove of forest-trees with prairies on three sides, and is in an agricultural and lead and zinc mining region. The streets cross at right angles and are from 60 to 80 feet in width; many are macadamized or paved with brick. The city is lighted by gas and electricity, and has electric street-railways, improved water works and sewerage, and two public parks. There is a U. S. Government building which cost with grounds \$150,000, and contains the post-office, land-office, Federal courts, internal-revenue office, and signal-service quarters. Immediately S. of the city is a National Cemetery, containing the remains of 1,600 Union soldiers, and adjoining it is another cemetery with the graves of about 500 Confederate soldiers.

Churches and Schools.—Springfield contains 9 Methodist Episcopal churches, 7 Baptist, 6 Presbyterian, 5 Congregational, 4 Christian, 3 Roman Catholic, 2 Protestant Episcopal, and a German Evangelical. The public-school system comprises a high school with building and ground that cost \$50,000, a commodious central building, and 9 ward schools, with 65 teachers and nearly 6,000 enrolled pupils. A normal school with accommodations for 2,000 pupils was opened in 1893. There are also 3 Roman Catholic parochial schools and 2 private kindergartens. For higher instruction there are Drury College (Congregational, chartered in 1873), which in 1894 had grounds and buildings valued at \$115,800, an endowment of \$210,000, 265 students, a faculty of 12, and classical and scientific courses; a Roman Catholic college; and several academies. Springfield has a circulating library, and 3 daily and 6 weekly newspapers.

Finance and Banking.—In 1894 the city revenue was \$89,753; expenditures, \$80,962; bonded debt, \$188,800; and assessed property valuation, \$7,790,923. There were 5 State banks, a national bank, a private bank, with aggregate capital of \$725,000 and deposits of \$1,890,000, and 4 loan and trust companies.

Business Interests.—The city has a large jobbing trade, embracing the chief lines of merchandise, and covering principally Southwestern Missouri and Northwestern Arkansas. The industrial establishments comprise railway-car and repair shops, the largest wagon-factory in the State, 4 candy-factories, 4 roller flour-mills, 3 tobacco-factories, 2 iron-foundries, a furniture factory, a cooperage, and a stove-factory.

Pop. (1880) 6,522; (1890) 21,850; (1894) estimated, over 25,000. JOHN B. WADDILL.

Springfield: city; capital of Clarke co., O.; on the Mad river, Lagonda creek, and the Cleve., Cin., Chi. and St. L., the Erie, the Ohio S., and the Pitts., Cin., Chi. and St. L. railways; 40 miles W. of Columbus, and 80 miles N. E. of Cincinnati (for location, see map of Ohio, ref. 5-D). It is in an agricultural region, but is best known for its extensive manufacture of agricultural implements. The city has gas and electric-light plants, water-works, sewers, and street-railways, and obtains excellent power for manufacturing pur-

passing from the river. Water for domestic use is supplied from springs. The public buildings include a new city-hall (cost \$225,000), new U. S. Government building (cost \$115,000), and a free public library presented to the city by B. H. Warner (cost \$100,000).

There are nearly 50 churches and other places of worship, 36 public-school buildings, public-school property valued at over \$250,000, high school, Springfield Seminary, a business college, and 5 daily, 10 weekly, 2 semi-monthly, and 7 monthly periodicals. Springfield is the seat of Wittenberg College (Hathorn, chartered in 1845), which in 1895 had 18 instructors, 302 students of both sexes, and 10,000 volumes in its general and society libraries, and had graduated 600 students since its opening.

The manufactures include mowers and reapers, grain-drills, grain-separators, mowers and reaper knives, reaper-guards, portable and stationary steam-engines, steam-haulers, sewing-machines, turbines, water-wheels, flour-mills and wind-mills, spring beds, kerosene oil, carriages, galvanized iron-work, lime, brick, whisky, and flour. In 1890 the census showed 75 industries with 372 establishments. Over \$14,000,000 capital and nearly 7,000 persons were employed. The payments for wages aggregated \$3,195,441 and for materials \$4,751,994. The total value of articles manufactured was \$10,760,965, of which \$5,251,008 represented the output of agricultural implements.

The city had in 1898 an assessed valuation of \$17,114,332 and a net debt of \$839,790. There are 5 national banks with combined capital of \$1,300,000; a savings-bank, and 3 building and loan associations, local and permanent, with 1,664 shareholders and 6,472 shares in force. Pop. (1890) 59,790; (1896) 61,805.

Springfield: town; capital of Robertson co., Tenn.; on the Louisville and Nashv. Railroad; 80 miles N. W. of Nashville (for location, see map of Tennessee, ref. 5-E). It is in an agricultural and stock-raising region; is engaged in growing tobacco, corn, wheat, and grass; and contains flour-mills, sawmills, brick-works, a tannery, a national bank with capital of \$60,000, a State bank with capital of \$30,000, and 2 weekly papers. Pop. (1890) not in census; (1896) 1,372.

Springs: fountains or streams of water flowing out of the earth and fed by rains on higher lands, frequently at some distance. As the water of springs often flows through subterranean channels which are beyond the reach of changes in surface temperature, it is little affected by the seasons, and is often maintained at about the average annual temperature of the locality. When it emanates from a deeper source it is sometimes highly heated, producing **THERMAL SPRINGS** (q. v.). When, as is often the case, the water is impregnated with chemical substances, such springs are called **MINERAL SPRINGS**. See **WATER** and **MINERAL WATERS**.

Spring Valley: city; Bureau co., Ill.; on the Burlington Route, the Chi. and N. W., and the Chi., Rock Is. and Pac. railways; 100 miles S. W. of Chicago (for location of county, see map of Illinois, ref. 5-E). It is in a coal-mining region, has important manufacturing interests, and contains a national bank with capital of \$50,000 and two weekly newspapers. Pop. (1890) 3,847.

Springville: village; Erie co., N. Y.; on the Buffalo, Rochester and Pitts. Railway; 80 miles S. of Buffalo (for location, see map of New York, ref. 5-C). It contains the headquarters of the Springville cheese-factory combination, which uses the milk of 5,000 cows daily and produces 2,000,000 lb. of cheese annually. There are 9 churches, an endowed academy and union free school, public library, 3 parks, soldier's monument, natural gas-supply for fuel, electric-light and power plant, excellent water-system, numerous manufacturing, a national bank with capital of \$50,000, a private bank, and 2 weekly newspapers. Pop. (1890) 1,227; (1896) 1,389; (1895) estimated, 2,100.

EDITOR OF "JOURNAL AND HERALD."

Springville: city (founded in 1850); Utah co., Utah; on the Rio Grande W. and the U. Pac. railways; 6 miles S. of Provo, the county-seat, and 50 S. by E. of Salt Lake City (for location, see map of Utah, ref. 4-M). It is in a beautiful valley near the east end of Utah Lake; has abundant water-power, and is engaged in farming, stock-raising, and manufacturing. There are 5 district schoolhouses, an academy, a Mormon and a Presbyterian church, a State bank with capital of \$50,000, and a weekly newspaper. Pop. (1890) 2,812; (1896) 2,540; (1895) estimated, 3,000.

EDITOR OF "INDEPENDENT."

Spruce [*Frax. M. Eng. spruce*, variant of *Frax. Prunus*, the tree being first known as a native of Prussia]; any one of several trees of the genus *Prunus*, in the U. S., especially *P. nigra*, black or double spruce, and *P. alba*, white or single spruce. Both of these afford much useful timber, superior to that of hemlock, but inferior to the best pine. There are also several trees called spruce on the Pacific coast. (See also *Fir* and *Pine*.) The so-called Norway spruce, *P. norvegica*, very widely planted, is a noble forest tree of the north of Europe. The native spruces of the U. S. afford a resinous substance called spruce-gum, much used as a masticatory. The tops are often brewed to make a pleasant drink called spruce-beer. It is made by adding the essence of spruce to water in which sugar or treacle has been dissolved, in the proportion of about 4 oz. of essence to 10 lb. of sugar or three parts of treacle, and 10 or 11 gal. of water, with about half a pint of yeast.

Revised by L. H. HARRIS.

Speller, esp. Mr. Louis: publicist and politician; b. at Saurre, Côte-d'Or, France, Dec. 8, 1835; studied law, and was admitted to the bar in Paris, but abandoned the legal profession to devote himself to journalism and politics. An intimate friend of Gambetta, he took part in the formation of the latter's journal, *La République Française*, and afterward became its editor-in-chief, but resigned this position after his election to the Chamber in 1876. In the Chamber he was active on several important commissions, concerning himself especially with questions relating to education and foreign affairs. He was Under-Secretary for Foreign Affairs in the short-lived cabinet of Gambetta, 1881-82; Minister of Public Instruction in the cabinet of Rouvier, 1887; and Minister of Foreign Affairs in that of Tirard, 1890-91. He was elected to the Senate Apr. 24, 1892. Among his writings are *Petite histoire du second Empire, utile à lire avant le Pétrole* (1870); *Ignace de Loyola et la Compagnie de Jésus* (1870); *Michel, sa vie et ses œuvres* (1876); *Confessions populaires* (1876 and 1881); *Figures disparues* (1886); and *Les ministres de l'instruction publique* (1890). P. M. C.

Spur: See **Razor**.

Spurge: See **EUPHORBIA**.

Spurgeon, Charles Haddon: preacher and writer; b. at Kelvedon, Essex, England, June 13, 1834, the son of an Independent preacher; was educated at Colchester; became usher of a school at Newmarket, but, embracing Baptist views, joined a congregation of that denomination in Cambridge; became a tract-distributor and village preacher, and at the age of eighteen minister of a small chapel at Waterbeach, where he soon became noted for his zeal and eloquence. He went to London in 1853, where he at once attracted audiences so numerous that the congregation was compelled to remove first to Rector Hall, and thence to the still larger Surrey Hall. In 1861 an immense chapel, called the Tabernacle, was built for him in Newington Butts, London, where he afterward preached. Nearly 30,000 persons were admitted to his church, and thirty-six other chapels were opened in London, the ministers of which were trained at a college founded and directed by him. His sermons were printed weekly, and from them thirty-seven volumes were made up. He also published *The Saint and his Saviour* (1857); a *Commentary on the Psalms* (7 vols., 1865-80); *Gleanings among the Sheaves* (1868); *John Bunyan's Pilgrim* (1868); *Evening by Evening and Readings for the Church* (1869); *Parables for Arrows* (1870); *Types and Emblems and Lectures to my Students* (1875); *Storm Signals* (1886); *Messengers to the Multitude* (1892); and other works. In 1897 he laid the foundation of an orphanage at Stockwell established by his congregation, and in 1895 became editor of a journal, *The Sower and the Seed*. D. at Menton, France, Jan. 31, 1892. See the *Life* by Shindler (1892).—His son, THOMAS SPURGEON, was elected pastor of the Tabernacle in 1894.

Revised by W. H. WHITNEY.

Spurgesworth: the *Euphorbia*; a family of about 3,000 species of dicotyledonous herbs, shrubs, and trees, for the most part natives of the tropics, but with many representatives in all regions. The flowers are often monocious or dioecious, and the perianth is generally small. The ovary is usually tri- or tetra-lobed, with one or two anthers on each side. The stamens are generally numerous, and are commonly clustered and branched. Nearly all species have well-developed latexiferous tubes in their stems and leaves containing a milky fluid (latex). They are much-modified relatives of the mallows, with which they should be associated in spite of their usually apetalous structure.

More than 200 are North American, fully one-half belonging to the genus *Euphorbia*, commonly represented by *E. maculata*, *E. nutans*, both prostrate spreading species, and *E. corollata*, an erect, white-flowered, weedy herb.

Economically the family is of great importance; medicines are supplied by species of *Croton*, *Euphorbia*, *Jatropha*, *Joannestia*, *Mercurialis*, *Ricinus*, *Stillingia*, etc.; caoutchouc by the latex of *Hevea*, *Mabea*, *Manihot*, and *Sapium*; food by species of *Manihot*, slender plants of the tropics, with large starchy roots, the product being known as tapioca and cassava. The box-tree (*Buxus sempervirens*) is ornamental, and its wood (box-wood) is most useful, especially for engravers' purposes. Many species are grown in conservatories, some of them resembling cactuses in their succulent, leafless stems.

CHARLES E. BESSEY.

Spurrey: any plant of either of the genera *Spergula* and *Tissa* (*Spergularia*), belonging to the family *Caryophyllaceae*. *Spergula arvensis*, well known to farmers of Europe and North America as a weed, is profitably cultivated in the Low Countries and Germany as a forage-plant, and its seeds yield a valuable oil and oil-cake. *S. pilifera*, a dwarf alpine plant, has been recommended as a lawn-plant in proper climates, being handsomer than grass and requiring much less care.

Revised by CHARLES E. BESSEY.

Spur-winged Goose: the *Plectropterus gambensis*; a goose deriving its popular name from the strong tubercle, or blunt spur, on the bend of the wing, formed by the projecting wrist-bone (radiale). The body is slender, neck and legs long; there is an excrescence at the base of the beak. The bird is about 3 feet long; chin, throat, center of breast, under side, and scapulars white, rest of plumage greenish black. It is found in Central and South Africa. F. A. L.

Spurzheim, spoorts'him, KASPAR: phrenologist; b. at Longwich, near Treves, Rhenish Prussia, Dec. 31, 1776; studied medicine at Treves and Vienna, and became a zealous disciple of Dr. Gall, whom he accompanied on his travels in Germany and France, and assisted in popularizing his phrenological doctrines by lecturing, newspaper articles, etc. In 1813 he separated from Gall, and undertook the introduction of the new doctrines in England, where he resided from 1814 to 1817, and from 1825 to 1828, and gave very popular lectures. From 1817 to 1825 he lived in Paris. In 1832 he removed to the U. S., and had just begun to excite interest when he died in Boston, Nov. 10, 1832. Among his writings are *The Physiognomical System of Drs. Gall and Spurzheim* (London, 1815); *Outlines of the Physiognomical System* (1815); *Sur la Folie* (Paris, 1818); *Essai philosophique sur la Nature morale et intellectuelle de l'Homme* (1820); *A View of the Elementary Principles of Education* (1821). See the memoir by Carmichael (1833).

Sputum: in pathology, the substance expectorated from the lungs. See EXPECTORATION.

Spuyten Duyvil (spī ten-dī'vil) Creek [probably from the Dutch *Spuyt den Duyvil*, in spite of the devil]: the channel connecting the Hudson river with the Harlem river, and thence with the East river, on Long Island Sound. The creek forms the northern boundary of Manhattan Island.

Spy [deriv. of *spy* (verb), from O. Fr. *espier* (> Fr. *épier*), from O. H. Gerin. *spehōn* > Mod. Germ. *spähen* < Teuton. *speh-*: Lat. *spēcere*, look at, view]: in the laws of war, a person who goes in disguise or under false pretenses within the lines or territory of a belligerent to observe his strength and obtain information concerning his works and movements for the purpose of communicating the same to the enemy. The rules of warfare among all modern civilized nations permit the infliction of the death penalty upon spies taken in disguise within the enemy's lines. The employment of spies, however, is considered a kind of deceit allowable by the rules of war, and, notwithstanding the ignominious method of inflicting death (usually by hanging), it has not infrequently happened that men of high honor have undertaken the office. Two of the most notable instances in all history are those of Capt. Nathan Hale and Maj. André during the Revolutionary war.

Because of the treachery involved in acting as a spy all authorities are agreed that although a sovereign may hold out an inducement or the temptation of a reward to persons to engage in such service, yet the service can not be required of subjects, except, perhaps, in some singular case of the last importance. In Great Britain by the Naval Discipline Act (29 and 30 Vict., c. 109, § 6) spies can be tried by a naval court martial, and shall suffer death or other punishment.

In the U. S. the instructions for the government of the armies of the U. S. in the field provides (General Orders No. 100, sec. v., § 88) that "the spy is punishable with death by hanging by the neck, whether or not he succeed in obtaining the information or in conveying it to the enemy."

Exactly what acts shall bring a person within the definition of a spy is not definitely determined, nor when he ceases to be a spy after once having had that character. In the Franco-German war of 1870 the Germans claimed that persons crossing their lines in balloons were spies; but this is not in accordance with the treatment of the subject of spies in the rules proposed at the Conference of Brussels in 1874 (Project of an International Declaration concerning the Law and Custom of War, Arts. 19-22), which expresses the opinion generally accepted among the nations of Europe. See Vattel's *Law of Nations*; Kent's *Commentaries*; and Halleck's *International Law*.

F. STURGES ALLEN.

Squall [Mod. Lat., from plur. of Lat. *squālus*, a kind of sea-fish]: See SHARK.

Squalls: bursts of wind, usually of brief duration, and when accompanied with the proper precipitation called rain-squalls or snow-squalls. They are of many varieties as to origin. One of the commonest is the falling wind which descends on the water from mountainous coasts. On the northwest coast of Lake Superior they descend from the bluffs and low mountains only a few hundred feet high, yet with such violence and suddenness in calm, warm weather, and in the heat of the day, that they are very dangerous to sailing-vessels. In the Aleutian islands they often descend the mountains behind a head of white wool-like fog, and are therefore called "woollies." The papagayos of Lakes Nicaragua and Managua, and of the Papagayo Bight on the west coast of Nicaragua and Costa Rica, are of the same character, but of longer duration. They usually fall on the ocean at from 10 to 20 miles from land, and the navigator must keep within 10 or beyond 40 miles from shore if he wishes to escape them. Of the same character also are the neevados, a falling diurnal wind in Ecuador and Peru, when the air descends on the plains from the snow-fields of the higher mountains. Of another type is the derecho of the western parts of the U. S., an occasional non-vortical wind which spreads in a fan shape as it advances from the N. W. These squalls are often mistaken for tornadoes, which are vortical local storms. The white squalls of the tropical seas on the west coast of Africa are sudden and furious bursts, whose approach is indicated by an advancing but harmless-looking white cloud. MARK W. HARRINGTON.

Squarclione, squār-chō'nd, FRANCESCO: painter; b. at Padua, Italy, 1394. His love of art led him to travel much in Greece and Italy, where he became acquainted with the masterpieces of ancient sculpture. He then formed a collection of busts, torsos, and bas-reliefs, with which he adorned his studio, and opened a school which became very popular, and in which Andrea Mantegna studied. He employed the help of his assistants to such an extent that only one picture exists in Padua which is supposed to be entirely his work, viz., the *St. Jerome and other Saints*, painted for the Lazzare family and placed in the Carmelite church. D. at Venice, 1474.

Square Root: See ROOR.

Squares, Method of Least [*square* is from O. Fr. *esquarre* > Fr. *équerre*, carpenter's square, deriv. of *équarrer*, as Ital. *squadra* of *squadrare* < Lat. **exquadra're*, make square; *ex* + *quadra*, a square]: a process used for the purpose of obtaining the most probable value of a quantity from a series of observations. In all measures, from the ordinary rude weighings and measurements of agriculture and commerce up to the most refined astronomical work, there is a liability to error which can not be avoided. An ordinary scale, for instance, can be used to measure down to a sixteenth of an inch; that is, if carefully used, its results will be correct to that limit. The level of a transit-instrument can make its measures, when used with care, to a ten-thousandth of an inch or even less; but in this case the hundred-thousandths will be uncertain. An ordinary observer notes his time to minutes only, and is likely to state the time incorrectly to the extent of at least half a minute: the man who is trying a fine watch will note its errors to seconds, or even half seconds; the astronomer uses tenths of seconds in his rough data and hundredths or thousandths in his calculations, but even here there is always uncertainty in the fractions of a second.

Observations or measures of the same thing never agree perfectly—that is, in the minutest fractions; how shall the true result be ascertained from discordant evidence? The ordinary experience of mankind has shown that it is best to "strike an average." When, for instance, two equally good surveyors measure a field a little differently, the half sum of their results is taken. The average prices of commodities are taken for their real prices, or at least for a better estimate of their real value than the extreme prices either way are affected by temporary fluctuations. The whole business of insurance rests upon this law of averages.

The "method of least squares" is the application of this law to the results of physical measurements, especially in astronomy and geodesy. The mathematicians whose names are most prominently connected with it are Legendre, Gauss, Bessel, and Kueske; Legendre and Gauss seem to have discovered it independently. A short sketch of the history of the method will help in its explanation. Before the method of least squares, as we now have it, was discovered, the method of averages, or of the arithmetical mean, was applied to all physical measures which give a direct result. But in astronomy the things to be found out can not always be directly measured, but must be indirectly inferred from measurements of other things. The observations upon the transit of Venus afford an instance. Here the main thing to be found out is the solar parallax; the thing directly observed is the planet's ingress upon or egress from the sun. The time of this depends upon several unknown quantities, of which the solar parallax is one, and also the unknown time of conjunction, and the unknown distance of the planet's and sun's center at that time, as well as the apparent angular diameter of planet and sun. Each observation, then, gives an equation of condition between these five unknown quantities, and at any one place four observations of contacts are made. At thirty stations there would be 120 equations for five unknown quantities; if the best five of these were selected, a good value of the solar parallax might be obtained; but many thousand good combinations can be made, each of which gives a different result, owing to the errors of the observations. How, then, can such a combination be made as to answer to the average in more direct measures? or, to express it mathematically, how can the superfluous equations of condition be combined so as to give the best possible result? The mathematical problem here treated is analogous to the combination of ordinarily discordant evidence in a perplexed case in the courts of law: when the result here needed is one capable of numerical expression, as in the assessment of damages, the average is taken; but where not, the evidence is reconciled as well as possible. Gauss has shown that in simple cases the ordinary law of averages is justified, and that in complex work, like the transit-of-Venus reductions, the following rule is to be used, which is the more general form of the same law: "In treating observations of equal precision the unknown quantities are to be so determined that, after allowing for constant error, the sum of squares of the remaining errors shall be the least possible." This is the "method of least squares." Its practical working is easy after the data are put into proper shape, and its advantages are so great that it is very largely used. It affords a thorough criticism upon one's own work and that of others, and for this reason is in great favor where the observers are most delicate, keen, and courageous, especially in Russia, Germany, and the U. S. Revised by S. NEWCOMB.

Squaring of the Circle: See QUADRATURE OF THE CIRCLE.

Squash [from Massachusetts Ind. *asquash*, plur. of *asquash*, green, raw]: a name applied in North America to fruits and plants of *Cucurbita maxima*, to the bush or summer varieties of *C. pepo*, and also sometimes to varieties of *C. melonensis*. Usage varies as to the application of the name, but it belongs to *C. maxima* rather than to the others. (See *POPPING*.) The fruits of *C. maxima* have soft, cylindrical stems which are not inflated at their insertion, the flesh is dry and orange-yellow, and the seeds are large and not thin-margined. Varieties of this species are Hubbard, Boston Marrow, the Turban, Marblehead, and the like. J. H. B.

Squash-bug: the *Anasa tristis*, a hemipterous insect, well known for its ravages upon squash and pumpkin vines. It belongs to the *Coccinea*. It is six-tenths of an inch long, about three-tenths of an inch in breadth, and of a dirty brown. It emits a powerful and offensive odor. The striped squash-bug is *Diabrotica vittata*, a beetle of the family

Chrysomelidae, a much smaller but even more destructive insect, which infests cucurbitaceous vines of almost all kinds in the U. S. As a rule, these insects are most destructive while the plants are young; and the squashes should be protected by a spray composed with molasses, or powdered gypsum and shell-lime may be freely sprinkled upon the plants, and will be found to impede the destructive work, particularly that of the striped bug. The use of salt in the manure is no avail with respect to the bug, and is injurious to the plant. Revised by J. S. KENNEDY.

Squash Family: the *Cucurbitaceae*. See the article on the Gourd Family.

Squalter Sovereignty: a term used in the political history of the U. S. to denote the principle of leaving to the settlers within the Territories of the U. S. the decision of the question whether slavery should be permitted by the constitutions to be adopted when the Territories become States. See KANSAS (History) and UNITED STATES (History).

Squelague: See WLAGH.

Squid: a popular name for many decapod cephalopods, particularly those of the family *Teuthidae* (calamaries), but also extended to the *Sepiidae* or true cuttlefishes, and even to the *Polydora* or *Octopodidae*. The squids proper are found in nearly all seas; they form an important part of the food of many fishes and crustaceans, are extensively used as fish-bait, and in many countries are much used as food. (See CEPHALOPODA, CUTTLEFISH, FLYING SQUID, INK-SQUID, etc.) There are several true squids which are common on the U. S. coast. Revised by D. S. JENNIS.

Squier, FERRIS GERRARD: archaeologist; b. at Bethel, Me., June 17, 1821. He received the ordinary education of a farmer's son, was a school-teacher, and subsequently editor of country papers in New York and Ohio, and studied engineering. He was early interested in Indian antiquities, and in 1842-48 made, with Dr. E. H. Davis, an investigation of the mounds of Ohio and the neighboring States; the results were published in the *Smithsonian Contributions to Knowledge* (1848) as *Ancient Monuments of the Mississippi Valley*. Similar investigations in his native State resulted in the *Antiquities of the State of New York* (1851). In 1849-50 he was *special chargé d'affaires* to Central America, arranging treaties with several of the states; and in 1850 he was engaged to examine the line for a proposed interoceanic railway in the same region. He published *Nicaragua, its People, Monuments, etc.* (1852); *Waukena, or Adventures on the Mosquito Coast* (first published with the pseudonym *Samuel A. Bord*, 1856); *The States of Central America* (1857); and several other books and reports in English and French. His work on *The Serpent Symbol* (1852) attracted wide attention. In 1853-65 he was U. S. commissioner to Peru, and his investigations of the Incarian antiquities were the most important and exact that had been made up to the time. Returning, he took up his residence at New York, where from 1868 he was consul-general of Honduras. He was prominent in organizing the American Anthropological Society, and was its first president in 1871. The French Geographical Society voted him its gold medal, and he was a member of many other foreign and American learned societies. Several years were spent in the preparation of a work on Peru, and it was nearly ready for the press when, in 1874, a severe illness incapacitated him for continuous mental labor. The work was published in 1876, and is one of the most important contributions to our knowledge of Peru. D. in Brooklyn, Apr. 17, 1888. Besides the works mentioned, he was the author of numerous scientific papers and magazine articles. Many of his books were translated into Spanish and French. HENRIET H. SMITH.

Squill [via O. Fr. from Lat. *squilla*, scilla = Gr. *σκόλλα*]: a drug made from the bulb of *Urginea maritima* (sea-onion), a perennial plant of the family *Liliaceae*, growing on the Mediterranean coast. The bulb is pear-shaped, of the size of a man's fist, or even larger. It is made up of concentric scales, like other tunicated bulbs, of which the outer are dry and dark colored, but the inner fleshy and juicy, and either colorless or of a pale roseate tint. For use in medicine the bulbs are dried and sliced, and after the varieties known as white and red squill, according to the tint of the bulb. Squill has little smell, but an acrid, nauseous, bitter taste. It contains a good deal of mucus, but there is still much uncertainty concerning the nature of the active principles. A resin and a bitter principle probably have to do with the medicinal effects. Squill has been known as a

medicine from a very remote period. It is an acrid irritant, affecting the mucous membranes and glands, and in large dose causes vomiting, purging, strangury, and may even prove fatally poisonous. Its medicinal use is from its producing, in small dose, an increased flow of urine, and also modifying in some unknown way the morbid condition of a mucous membrane affected with catarrh, and especially of the bronchiæ.

Revised by H. A. HARE.

Squilla: one of the stomapod crustaceans. See the article on the STOMAPODA.

Squinting, technically termed *Strabismus* [Mod. Lat. from Gr. *στραβισμός*, a squinting, deriv. of *στραβός*, distorted, squinting]: the condition of vision when the visual axis of one eye is deviated from the point of fixation. The eye whose visual axis is directed to the object fixed is termed the *fixing eye*; the other is called the *squinting or deviating eye*. The deviation may be inward, *convergent strabismus*, outward, *divergent strabismus*, upward or downward, *vertical strabismus*. In convergent squint the visual line of the squinting eye is deviated inward, and intersects that of the sound eye at some point nearer than the object fixed; in divergent squint it lacks the necessary movement inward to intersect that of its fellow at the point of fixation, and hence it deviates outward. Strabismus may be paralytic, or concomitant.

(1) In *paralytic squint* the deviation is caused by a paralysis of one of the muscles of the eyeball. The normal position of the eye and the correct direction of its visual line depend upon the tonicity of the four straight muscles, attached one above, one beneath, and one on each side of the eyeball. If one muscle is paralyzed, the eye is deflected to the opposite side by the stronger or intact muscle. Generally with paralytic squint, in addition to the deviation, there is loss of movement in the direction of the action of the affected muscle. Thus, if the outer straight muscle of the right eye were paralyzed, the affected eye could not move toward the temple on that side, and would be turned inward by the action of the inner straight muscle which is unaffected—that is, there would be a convergent squint. There is also generally double vision, because the images from an object do not fall upon identical points in the two retinas, and hence are no longer fused, as is the case when the eyes are normally moved by the muscles. Paralytic squint is caused by diseases of the brain, meningitis, and spinal cord, especially locomotor ataxia, certain general diseases like syphilis, rheumatism, diphtheria, diabetes, etc.; poisons, e. g. lead, and injuries.

(2) In *concomitant squint* the deviating eye is able to follow the movements of the other in all directions. The squint may be either periodic or permanent, and it may affect one eye or it may alternate. The average age for the appearance of concomitant squint is about four years, being usually first noticed when the child is beginning to learn to spell or read with small letters. There are a number of causes for concomitant squint, but the most important is a disturbance in the relation of the power of accommodation in an eye to the power of convergence, i. e. of bringing the eyes closer together. When the eye is far-sighted (hypermetropic) to a given degree, i. e. when it has a low refractive power, a short antero-posterior diameter, and the rays of light are not focused on the retina, it requires an accommodation, i. e. power to adjust itself for different distances and objects, of an equivalent degree to neutralize it, the visual lines being parallel. Generally, however, some convergence will accompany the effort of accommodation. The point of convergence is then nearer than the point for which the eye is accommodated, or, in other words, there is a convergent squint. Far-sightedness is consequently often accompanied by convergent squint. In near-sightedness, on the other hand, or in that condition in which there is a high refractive power and a long antero-posterior diameter, the visual lines often intersect at a greater distance than the point for which they are accommodated, and there is divergent squint. In a great majority of the cases of permanent squint there is amblyopia or imperfect vision of the squinting eye. Two views have been held in regard to this amblyopia, one being that it is due to lack of use on the part of the squinting eye, i. e. that the squint causes the amblyopia; the other that it is congenital and depends upon an imperfect development of the centers of vision in the brain, i. e. that the amblyopia causes the squint. The double vision, which is so marked a feature in squint when it is caused by paralysis, is usually absent in concomitant squint, because the eye involuntarily

suppresses the false image, or else has learned to disregard it. In rare cases squint is due to spasm of the internal straight muscle. In paralytic squint the treatment consists in finding the cause and applying the proper remedies. In the low degrees, especially of the periodic varieties of concomitant squint, the eyes may often be straightened by prescribing the proper spectacles to correct the error or refraction which is at the bottom of the trouble. When the squint is marked and persistent it calls for operation: Incision of the ocular conjunctiva or mucous membrane, hooking up the tendon close to the cornea, and severing it. Very young children should not be operated upon. It is better to wait until the sixth or seventh year. G. E. DE SCHWEINITZ.

Squirrel [from O. Fr. *esquirel* > Fr. *écureuil*: Span. *esquirol* < Lat. **scurius* for *sciurus* = Gr. *σκίουρος*, squirrel]: any one of certain species of the family *Sciuridae*. The name is more properly applicable to the slender arboreal forms constituting the genus *Sciurus*. These are of moderate size or small, have a rather slender head, no cheek-pouches, rather long ears, no lateral wing-like extension of the skin, a large bushy tail, and the teeth are, as in all the other genera of the family, 24—viz., M. $\frac{3}{1}$, I. $\frac{1}{1}$ × 2—but the foremost upper molars are often early deciduous, and when present very small. The genus grades into *Tamias*, or the chipmunks, and *Spermophilus*, or the ground-squirrels. There are about 150 species, and representatives are found in almost every region, Australasia and Polynesia, the southern extremity of South America, and the West Indies being the only considerable bodies of land in the temperate or tropical zones destitute of them. Eighteen species, with sixteen geographical races, or sub-species, are found in North America N. of Mexico. In time they existed, according to some authors, as early as the Eocene Tertiary, but the affinities of those early forms are doubtful. In habits the living species are all essentially similar. Most of their life is spent among the trees, and they exhibit great agility in running up the trunks and leaping from branch to branch. Their principal food consists of the nuts of trees, and in nut-bearing forests they are especially to be found; they also eat to some extent the larvæ of insects, and attack the nests of birds for their eggs, and even for their young. Their favorite attitude in eating is to sit on their haunches, with their tail thrown upward on the back, and holding the eatables in their paws. In the colder countries they lay up stores of provisions in holes and nooks in or near the trees in which they live. They are mostly readily tamed, and are generally kept in cages with revolving wheels or treadmills, wherein they exercise.

Squirrel, Flying: See FLYING SQUIRREL.

Srinagar, or **Serlinagur**: capital of Kashmir, situated in a broad, marvelously beautiful valley at an elevation of 5,276 feet, and with a mean temperature of 56° 8' F. (see map of N. India, ref. 3-D). It is built on both sides of the navigable river Jhilam, from which numerous canals, spanned with light wooden bridges, branch off, the lively traffic by boat reminding one of Venice. The most remarkable building is the palace of the maharajah; it is called the Shergarh (citadel), and a large, beautiful flight of stairs leads from it down to the river. Close by the city is Lake Dal, which boasts of the far-famed isle Chinars (*Platanus orientalis*). Vegetables are raised here on floating rafts called gardens. About 21 miles N. W. of the city is Wular Lake, which covers 103 sq. miles. A small steamboat plies between the two lakes. Pop. (1891) 118,960, mostly Mohammedans.

Staal, MARGUERITE JEANNE CORDIER DE LAUNAY, BARONESS de: memoir writer; b. in Paris in 1684, the daughter of a poor painter; was educated in a convent at Rouen; became maid to the Duchess of Maine; took part in Cellamare's conspiracy for depriving the Duke of Orleans of the regency, and was imprisoned in the Bastille 1718-20; married afterward a Baron de Staal, who held a company in the guard of the Duke of Maine, and spent the rest of her life at the ducal court at Sceaux. D. in Paris, June 15, 1750. Her *Mémoires* were published in 1755, and republished in 1848 and 1878; her letters appeared in 1806, her *Œuvres complètes* (2 vols.) in 1821. Her *Mémoires* and letters have considerable interest to the student of history. See Sainte-Beuve, *Portraits Littéraires*.

Stabat Mater [Lat., *stabat*, was standing, third sing. imperf. indic. of *sta're*, stand + *ma'ter*, the mother]: the first

woods, and hence the name, of a Latin hymn ranked among the seven great hymns of the mediæval Church (*The Celestial Country* [from *The De Contemplatione Mundi*], *Dixi Ite*, *Miserere*, *Miserere*, *Veni Sanctus Spiritus*, *Veni Creator Spiritus*, *Yezus Rex*, *Contemplatione Sancti Michaelis* name, *Alleluia*, also known as *The Afflictive Sequence*). It begins—

*Stabat Mater dolens, By the cross, and right weeping,
Juxta crucem lacryans, Joined the sorrowful mother weeping.*

As the *Dixi Ite* (y. c.) has been pronounced the greatest, so the *Miserere* is deemed the most pathetic of hymns. Its author is unknown, but it is customarily assigned either to Pope Innocent III. (d. 1216) or Jacopone da Todi (d. 1306). This hymn is still in constant use in the Roman Catholic Church, being sung during the Holy Week and on the festival of the Seven Dolours of the Virgin Mary, and it is well known in a musical sense to all through the very beautiful and sympathetic music of Rossini. It has been the theme of several of the world's great composers of different eras. Prior to Rossini, Pergolesi perhaps produced the most famous and masterly, if not the most popular, work upon it.

Stadrock, *staal-rook*: See *GRONINGEN*, British Guiana.

Stachys, *sták's* (Gr. *stachys*, an ear of grain; name of a plant, woundwort): a genus of labiate plants, with a few species cultivated for ornament, and one, *S. arvensis* (but generally known as *S. tuberosa* and *S. affinis*), now somewhat grown for its edible tubers. See *COMBENT*. L. H. B.

Stade, *stade*: an old fortified town of Prussia, province of Hanover, on the Sobbing, near its influx in the Elbe (see map of German Empire, ref. 2-E). The so-called Stade dues, a toll which Hanover levied on all merchandise carried up the Elbe, but which was abolished in 1804, were paid here. Its manufactures are, wools, linen, and cotton stuffs, tobacco, and beer. Pop. (1890) 10,180.

Stadia Measurement: in surveying, a method of determining distances by graduated rods and the cross-hairs in the telescope of a transit instrument. The principle of the

Stadia measurement.

method is that of similar triangles, shown in the figure, the two hairs *a* and *b* seeming to be projected on the rod at *A* and *B*. Let *c* be the distance from the hairs to the object-glass and *d* the distance from the object-glass to the rod, then

$$d = \frac{AB}{ab} c = \frac{c}{ab} AB,$$

or $d = AB$ if the rod be graduated so that $c \div ab$ represents the unit of distance. This principle is slightly modified by the optical theory of the lens, since *c* varies for different distances, so that the expression for *d* becomes

$$d = \frac{f}{ab} AB + f,$$

in which *f* is the principal focal length of the lens, and in reality the lengths indicated by the intercept *AB* do not begin at the object-glass, but at a distance *f* in front of it. As, however, *f* is small in comparison with *d*, it is generally neglected in topographic work.

When the telescope and line of sight are not horizontal the angle of inclination is read, and the rod held vertical. Then the reading on the rod is to be multiplied by the square of the cosine of the inclination to give the horizontal distance, and by one-half the sine of twice the inclination to give the vertical distance. By the help of tables these computations are readily made in the field, and thus both the horizontal distance and the elevations of points with respect to a given station are quickly obtained.

The precision of stadia-work is fully equal to that of ordinary chaining on rough ground, the uncertainty being about 1/10th of the length of the line. Stadia measurements were introduced by Berni, an Italian engineer, about 1840; soon after used in topographical work in Switzerland, and introduced into the U. S. by J. R. Mayer about 1850. The word *telescope* is generally employed instead of *stadia* on the U. S. Coast and Geodetic Survey, which seems to be alone in this usage. Most text-books on surveying give the prin-

ciples and practice of the method. A small work with tables is Winston's *Stadia Surveying* (New York, 1894).

MANUEL HERRIMAN.

Stadium [*stai* = Gr. *stadion*]: the principal Greek measure of length for journeys, used in later times also for other linear measurements, especially by the Romans. Its length was fixed by that of the foot-race course (*stadeion*) at Olympia, and was 600 Greek = 600 Roman = 600 English feet, or one-eighth of the Roman mile. Stadium was originally the name of the foot-race course in which running and other athletic exercises took place. Stadia existed at many Greek cities, but the most famous was that of Olympia. The stadium was laid out in two parallel oblong areas, connected at one end by a semicircular track. The whole was surrounded by seats for spectators.

Stadtholder [Dutch *Stadhouder*, town-holder]: a governor of a country or province. In the course of the revolt of the Netherlands against Spain the seven United Provinces chose William, Prince of Orange, as their stadtholder. The title was intentionally a modest one, intimating that the revolt was not against the sovereign, but against the tyranny of his viceroy, the Duke of Alva. It involved the chief civil and military command, was given to Maurice, son of William, in 1607, and was held with some interruptions by the head of the state until the annexation of Holland to the French empire in 1802. On the restoration of the house of Orange in 1814 the title of king was assumed.

Stael-Holstein, Fr. pron. *stäl'holstén*, Anne Louise Germaine (Necker), Baronne de: historian, essayist, and novelist; b. in Paris, Apr. 22, 1766; daughter of Jacques Necker, the famous finance-minister of Louis XVI. She showed a precocious intelligence, and grew up in the brilliant salon of her mother, where she imbibed the intellectual curiosity and scientific spirit of the men who frequented it. In 1786 she married Baron de Stael-Holstein, Swedish ambassador at Paris, to whom she bore two sons and a daughter. Her marriage was not happy, and she was later separated from her husband, and mainly lived apart from him. Possessing remarkable gifts for conversation, she drew about her a circle of literary and public men, whom she charmed and dazzled. She greeted the beginning of the Revolution with sympathy, and her salon was the gathering-place of the admirers of the English Constitution. In 1792 she fled from the growing violence to her estate at Coppet, near Geneva, and then for a time to England; but in 1796 she returned to Paris and sought to re-establish her salon. In the same year she fell under the suspicion of the Directory, and withdrew again to Coppet, but returned once more in 1797, and her salon attained to new brilliancy and power. Among its assiduous visitors were Mme. Récamier, Mme. de Beaumont, C. Jordan, Parnet, and especially Benjamin Constant, with whom she fell in love and from whose capricious and unhappy character she had much to suffer. Her salon was decidedly hostile to Napoleon, who in Oct., 1800, sent her away from Paris. She traveled then in Germany and Italy, and in 1806 established herself again in Coppet, where her old friends and many new ones flocked about her, and where she held a kind of intellectual court. She traveled again in Germany in 1807, and upon her return announced her religious conversion. The appearance of her book on Germany was the signal for still severer measures by Napoleon. The French edition was destroyed, and she was ordered to retire to Coppet, where she was kept under surveillance, a virtual prisoner, and forbidden to receive her friends. She escaped in 1812 and took refuge successively in St. Petersburg, Sweden, and England. On the fall of Napoleon she returned to Paris in 1815, but she was disappointed at the tendencies of the restored monarchy. On July 14, 1817, in 1811 she had secretly married Alfred de Rocca, an officer but twenty-three years old, to whom she bore a son. Though her conspicuous influence upon her contemporaries was wielded by personal contact and her written works were considered to fall far behind the power and brilliancy of her improvisation in the excitement of conversation, her books are among the most important of the post-revolutionary period, and furnished a great stimulus to the new currents of French literature that were preparing romanticism. They are marked by fervid and sometimes hysterical sentiment, that often appears to protest against social conventions, especially in the essay *De l'Influence des passions sur le bonheur des individus et des nations* (1796), and the novels *Delphine* (1802) and *Corinne*

(1807); and by a wide range of intellectual view and just and profound ideas, which some have denied her the credit of originating, but which she at least grasped, communicated, and made available. These are exhibited especially in *De la Littérature considérée dans ses rapports avec les institutions sociales* (1800); *De l'Allemagne* (1810); and *Considérations sur la Révolution française*, her last work, published by her son in 1818. *De l'Allemagne* was of great importance in stimulating the influence of German thought and literature in France by giving the French public a more complete and sympathetic revelation of Germany than it had ever had. Other works are *Lettres sur les écrits et le caractère de J. J. Rousseau* (1788) and *Dix années d'exil* (posthumous). Her son published her *Œuvres complètes* (17 vols., 1821). See Lady Blennerhasset, *Frau von Staël* (3 vols., 1888-89); A. Sorel, *Madame de Staël* (Paris, 1890).

A. G. CANFIELD.

Staff: an exterior covering for buildings, resembling plaster or stucco, first used at the Paris Exposition of 1889, and employed for most of the buildings and exterior decorative work of the Columbian Exposition at Chicago in 1893. It is made of hydraulic cement, sand, and a binding material of jute fiber.

M. M.

Staffa: a small, uninhabited island of Argyllshire, Scotland; 6 miles W. of Mull; celebrated for its curious caverns, among which that called FINGAL'S CAVE (*q. v.*) is the most remarkable. Among the other caves are the Cormorant and the Clam-shell. The greater part of the coast is girt with cliffs from 84 to 112 feet high. In the N. E., however, in the lee of the prevailing winds, is a tract of low shore stretching out in beaches and forming a landing-place, and the interior table-land is covered with rich soil and luxuriant grass, which feeds a number of black cattle.

Revised by M. W. HARRINGTON.

Staff and Staff Schools: the assistants of the general-in-chief of an army and of his generals, and the institutions in which they are trained for service on the staff. The term staff as commonly used includes (1) the heads of departments (such as artillery and engineers, military law, medical, quartermaster, pay, etc.), (2) the personal staff (including aides, orderly officers, etc.), (3) adjutants, and (4) a special body of officers, intrusted with duties connected directly with military operations, entitled the *general staff*.

The general staff has been universally recognized as an essential part of modern army organization. Its purpose is to convert the ideas of the general commanding into orders, not only by conveying them to the troops, but far more by working out all the necessary matters of detail (Clausewitz); and to watch over and preserve the fighting condition and material welfare of the troops (Schellendorf).

Germany.—All European states since the great success of the Prussian armies in their contests with Denmark, with Austria, and with France, in the campaigns of 1864, 1866, 1870-71, have made the Prussian staff system in some degree their exemplar. The origin of a general staff is probably to be found in the Swedish organization of the seventeenth century (then regarded as a model), and traces of it (no doubt taken therefrom) are found in the army of the great Elector of Brandenburg, who had, in 1655, two quartermaster-generals, officers doing special duty other than the direct command of troops—the germ of the German general staff of to-day. In 1657 were added to the general staff a field-marshal, a commissary-general and his assistant, 2 adjutant-generals, a judge-advocate, a provision-master, a quartermaster, a paymaster, a chaplain, a surgeon and an apothecary, a wagon-master, a provost-marshal with 3 assistants, and 11 clerks.

Frederick the Great had few staff officers. This great captain was not only his own chief of general staff, but he often assumed the functions of a staff officer of an inferior grade. The staff of the quartermaster-general then had merely a nominal existence. In 1741 there were 5 colonels, 4 adjutant-generals, 1 brigade-major, 5 majors (wing-adjutants), 1 quartermaster-general with 1 colonel and 2 majors as assistants, and 9 colonels and lieutenant-colonels of the army on general staff-duty. The king's instructions to his quartermaster-general, dated 1757, contain the principles of the construction, attack, and defense of fortresses and fortified camps; reconnaissance duty was performed by his engineers; the captain of the guides conducted columns of route, as no maps then existed, while the brigade majors regulated the guard duties in camp. In 1796 the survey of the kingdom was intrusted to the quartermaster-general's staff.

These were the beginnings of the general staff, but it was not until 1806 that Col. von Massenbach gave it a definite organization, and had assigned to its officers their proper duties, which, in general outlines, are still retained.

After the destruction of the Prussian army by Napoleon in the campaign of 1806, Col. von Scharnhorst in 1808 became lieutenant quartermaster-general of the Prussian army, with rank of major-general. His staff consisted of thirty-four officers in all; one officer was attached to each brigade, and one (sometimes two) to each corps. After 1815 the organization of the staff, which had rendered distinguished and important services during the closing campaigns against Napoleon, was seriously studied. A part of its officers, placed under a special chief as the *great general staff*, was assembled at Berlin, while its other officers, doing staff duty in the general and divisional commands, were in direct contact with the troops. The general staff was under the Minister of War till 1821, when the king named Lieut.-Gen. von Mueffling chief of the general staff, which then acquired an independent position, taking its orders directly from the chief of the state and commander-in-chief of the army—a position it retains. To this independence of all subordinate authority the Prussian staff attributes its ability to render the services in its later campaigns which have placed it as first among military organizations. Lieut.-Gen. von Mueffling was succeeded in 1829 by Lieut.-Gen. von Krauseneck, who was followed in 1848 by Lieut.-Gen. von Reyer, on whose death, in 1857, Gen. von Moltke became chief of the general staff. The part played by this general staff in changing the map of Europe makes its history one of great interest.

The campaign of 1866 showed the necessity of having ready at the moment of mobilization of the army a great general staff, capable of being doubled, and of leaving behind it when the army takes the field a sufficient number of trained staff officers to make sure of the means and measures of military transportation, and to insure the continuance of the supplies necessary for the army of operations. In 1867 a royal order established the staff on the following footing: *Principal list:* chief of general staff of the army; chiefs of division at the offices of the great general staff; chiefs of staff of the army-corps, etc.; total, 88 officers. *Scientific list:* 21 officers at the office of the great general staff. Total, 109 officers, 46 belonging to the great general staff.

At the breaking out of the war of 1870 the German army contained 200 staff officers, which number was considerably increased in the course of the campaign. In 1891 the general staff proper consisted of 186 officers—127 attached to the staff of the corps, divisions, etc., 49 to the great general staff of Berlin, 10 to that of Munich; the auxiliary staff (*scientific list*), officers simply detached from their regiments and doing duty under the great general staff, consists of 68 officers. Besides these, the general staff comprises military *attachés* (about 10), directors of military schools (about 20), commissaries of railroads residing at important railway centers (25), and officers undergoing probation as staff officers (80). Moreover, there are some 400 adjutants, selected and assigned to duty by the chief of the general staff, so that there are about 800 officers employed on general staff duty.

The work of the great general staff is distributed to separate divisions. The chief of the general staff directs the whole. In his office, under direction of his aide-de-camp, questions relating to the personnel of the staff, to its organization and administration, are considered. The work of collecting military information, domestic and foreign, the use of railways, the pursuit of military science, preparation of maps, etc., are distributed to various sections, grouped according to their work or the countries to whose study they are devoted. The staff is divided into three sections, whose duty is to study attentively all military events, domestic and foreign; to keep themselves acquainted with the changes affecting the organization, recruiting, arming, and equipment of armies; to study the military geography of different countries, the establishment or demolition of fortresses, the development of the network of roads, railways, canals, etc. Each is directed by a chief. Several staff officers, and a number of officers ordered on staff duty and charged with the special study of military questions in different countries, are under the orders of each chief.

The fourth section is that of railways. This section is charged with all that relates to military transportation. It should know the connections of the railways at home and abroad, the equipment and rolling stock; and it elaborates

the great schemes for army transportation by railway. In consequence of the great number of officers needed to manage the movement of a great army by railway, as many officers as possible are from time to time attached to this section with a view to their instruction in these duties.

In the scientific corps of the staff are the officers who have charge of the section of military history, of the archives, and of the library. In this scientific corps belong also the section of geography and statistics and the preparation of military maps of foreign countries. The general service of charts belongs, under a chief of the trigonometric survey, to another part of the great general staff.

The officers of the general staff are selected from the ablest graduates of the military schools after a certain term of service in the line. They serve on the staff in greater number than can possibly become permanent staff officers. They return to the line and serve a term with their regiments. As vacancies occur in the permanent staff, they are filled by selection, at the discretion of the chief of the general staff, from those officers who have, while under his eye, given proof of greatest capacity and devotion.*

France.—In the French army, previous to 1880, the general staff was a separate corps of officers, but since that year it has been merely a service to which officers of the line are detailed for a term of years, these officers still belonging to their respective arms and being regularly promoted therein. By the law of June 24, 1880, the number of officers in the general staff was limited to 640, comprising 30 colonels, 40 lieutenant-colonels, 170 majors, and 400 captains, under whose orders are placed 180 archivists, constituting a special corps of officers, employed in clerical work and in keeping the records.

In time of peace the general staff comprises (1) the military household of the president; (2) the special staff of the Minister of War; (3) the general staff of the army; (4) the staffs of the military governors of Paris and of Lyons; (5) the staffs of army-corps, divisions, and brigades; (6) the staffs of territorial divisions and subdivisions; (7) the staffs attached to fortified places; (8) the staffs of marshals of France and general officers specially employed; (9) military *attachés* abroad; (10) the staff of the commanders of the artillery and the engineers.

The supply of officers for the staff comes mainly from the superior war school (see MILITARY ACADEMIES), but officers who have not gone through this school are allowed to compete for a staff certificate at examinations held concurrently with the final examination at this school. The officers who pass serve a probationary term of two years in the staff, after which the best are selected as required.

The personnel of the staff is brought up to the war footing by calling in all officers possessing the staff certificate who are in the active army, and by recalling all certified officers and archivists belonging to the reserve or the territorial army.

The general staff of an army-corps is composed of (1) 1 chief of staff (general or colonel), 1 colonel or lieutenant-colonel, 2 majors (sometimes 3), 3 captains, 2 orderly officers, 2 archivists and 8 secretaries in time of peace; in time of war, of 14 officers and 66 men; (2) the staff of the artillery, 8 officers and 19 men; (3) the staff of the engineers, 4 officers and 8 men.

A division has, in time of peace, 1 chief (lieutenant-colonel or major) and 1 orderly officer (captain or lieutenant); in time of war, 1 captain or lieutenant, and 30 men in addition.

A brigade has, in time of peace, 1 orderly officer (lieutenant or captain possessing the staff certificate), and 1 corporal or private as secretary; in time of war, 1 lieutenant of the reserve as orderly officer, and 9 men in addition.

The artillery and engineers have also a special staff, that of the former comprising 310 colonels, lieutenant-colonels, majors, and captains, also the second lieutenants of the school of application; that of the latter comprising 486 officers. The duties of the former consist in superintending the various establishments of that arm and supplying the troops with ammunition; those of the latter in constructing and repairing fortifications and military buildings, directing the engineer schools, military telegraphy, and the military pigeon-houses.

Russia.—The officers of the general staff in Russia form a special corps, and are exclusively graduates of the general staff school (Nicolas Academy) at St. Petersburg. Entrance to this school is by competitive examination, open to officers

of all arms who have served at least three years; the course is two and a half years, the last six months being devoted entirely to practical work in the field; about 80 students enter every year and about 60 graduate. Upon graduation the 30 best enter the general staff. There is also a geodetic subdivision of 20 officers, who, after a two and a quarter years' course here, have a two years' course at the observatory at Pulkowa and then enter the general staff. The general staff comprises about 480 colonels, lieutenant-colonels, and captains, who do duty in the different bureaus of the great general staff at the office of the Minister of War, or in the military schools, or in the general staff of the generals exercising command. Before being promoted they are always required to have served with troops, exercising certain commands, so that a number is always detached on such duty. The corps also comprises about 80 general officers doing general staff duty and about 170 on special duties of various kinds. Topographical work is not done by the general staff, as in other armies, but by a special corps of military topographers, about 450 officers; and there is still another corps, doing duty related to that of the general staff, viz., the *Feldjaeger*, about 45 officers, selected from various arms, for reconnaissance work, carrying important orders to a distance, etc. General officers also have their aides-de-camp, selected from the officers of their commands, and simply detached, but not considered part of the general staff.

Austria-Hungary.—The general staff of Austria-Hungary, suppressed as a special corps in 1871, but re-established as such by the law of Dec. 28, 1875, comprises on the peace footing 260 officers, besides a number attached for temporary duty. The corps proper is a closed corps, and an officer once admitted remains a part of it, whether he afterward does duty with troops or continues on general staff duty, but it is open for admission to all officers up to the rank of major.

Before entrance lieutenants are generally required to pass at the staff school (*Kriegsschule*),* located in Vienna. Admission to this school is by competitive examination, open to first or second lieutenants of at least three years' service, who are under thirty years of age and unmarried; each year about 45 enter. The course is two years, terminated by an examination, at which other officers who have not taken the course may also compete. Those who pass are assigned to the staff for a probationary tour of duty as required; they number usually about 135. If acceptable they become captains of the general staff; if not, they return to their regiments. Majors may come directly from the line, either by passing a special examination or by selection of the chief of the general staff. Promotion in the corps is by seniority.

Employed in the bureaus of the general staff of the army are about 30 officers, taken either from the retired list or from a special body of officers, not fit for active service, but who can be utilized for sedentary duties, called the *Armeestand*, who have their own uniform and are promoted among themselves. Besides these about 100 officers, detached from their regiments, are detailed on topographical work. The total on general staff duty is about 700.

Italy.—General staff duty in Italy is performed by a special corps of about 150 officers, drawn from the captains, graduates of the general staff school, who have commanded a company, squadron, or battery for at least one year. Upon promotion they generally return to the line, and are not again recalled to the general staff as majors until after serving another year with troops; but captains who served two years before admission may be promoted in the corps.

There are also about 120 officers temporarily attached to the general staff, including those graduates of the staff school (usually about 24) who are making their trial tour. Generals in command, besides their general staffs, have also orderly officers, selected from among the troops of their command and detailed for a term not exceeding three years; brigade commanders have neither general staffs nor orderly officers, but aides-de-camp are detailed to the brigade (not to its commander) by the Minister of War. The number of orderly officers and aides-de-camp is about 100. There are, therefore, about 370 officers on general staff duty.

* Austria-Hungary also has a military orphan asylum at Fischau, 4 lower military realschools at St. Pölten, Gläns, Eisenstadt, and Koscchau, a higher military realschool at Mährisch-Welaskirchen, 12 infantry cadet schools, 1 cavalry, 1 artillery, 1 engineer, and 1 pioneer school, the military academy (for cavalry and infantry) at Wiener-Neustadt, the technical military academy (for artillery, engineers, and pioneers) at Vienna, the higher artillery and engineer course, and the field officers' course, besides regimental and other schools for soldiers and schools of practice and application for officers.

* Saxony has its own cadet corps, and Bavaria has its own cadet corps, war school, artillery and engineer school, and war academy.

Great Britain.—It can scarcely be said that there is any British military staff as a separate and distinct corps of officers. The British War Department is dual, embracing both political and military officers. Command and administration are separate. The War Office and the Horse Guards, long distinct, were united into one department by act of Parliament in 1870. The general commanding-in-chief was thus brought into the War Office, which is under the Secretary of State for War. The latter is alone responsible to Parliament, while the former is subordinate, and can exercise his authority only under approval of the secretary; in practice, however, the secretary concerns himself with the army estimates only, and exercises merely a general control over the general-in-chief, who has immediate direction of all military affairs; two Under-Secretaries of State are placed immediately under the Secretary of State for War—the parliamentary secretary and the permanent under-secretary. The first retires at a change of ministry, and assists his chief in Parliament; the second does not sit in Parliament; he has the real direction of business, and does not go out with the ministry.

The military affairs come under the military department of the secretary, and are arranged under several bureaus: (1) That of the military secretary, dealing with matters relating to officers personally, such as orders, leaves of absence, detail to staff-duty, etc.; (2) that of the adjutant-general of the army, concerned with all questions of recruitment, organization, mobilization, instruction, and discipline; (3) that of the quartermaster-general, comprising clothing, equipment, quartering, food, forage, and transportation; the quartermaster-general has control of the commissariat and transport corps and the pay department; (4) that of the inspector-general of engineers and fortifications; (5) that of the director-general of artillery; (6) that of the director of military intelligence; (7) the director of military education, surgeon-general, chaplain-general, and principal veterinary surgeon.

The yearly army estimates and administrative matters are under the financial department, at the head of which is the financial secretary (a civil officer), under whom are four bureaus: (1) The accountant-general (specially charged with the army estimates); (2) the director of contracts; (3) the director of clothing; (4) the director of ordnance-factories.

There are two branches of general staff service in England, viz., the staff of the commands and the personal staff. The former comprises those officers who form the staff proper of general officers, those on topographical work, and those sent on special missions. The staff of a general officer is divided into two distinct bureaus, the adjutant-general's and the quartermaster-general's. In brigades a single officer, called brigade-major, combines the duties of both.

The personal staffs of generals comprise aides-de-camp and military secretaries.

The officers of the staff are taken exclusively from the regular army, and should have spent two years at the staff college or passed the final examination for graduation at that college. A condition of eligibility to examination for admission to the staff college is five years' service in the army. Every officer who presents himself for the graduating examination at Sandhurst Staff College (see MILITARY ACADEMIES) must have had seven years' service.

Officers on staff duty generally serve but five years, after which they return to their regiments and are not again available for at least two years.

United States.—In the U. S. there is no general staff properly so called, but (as in Great Britain) some of the duties of this body are performed by officers of certain departments or by officers of the line temporarily detailed. The so-called staff departments are (1) the adjutant-general's, comprising 1 brigadier-general, 4 colonels, 6 lieutenant-colonels, and 6 majors, their principal duties being the ordinary routine of office-work, the wording and issue of the orders of commanding generals, and in the war department all matters relating to recruitment; (2) the inspector-general's (1 brigadier-general, 2 colonels, 2 lieutenant-colonels, and 2 majors), their duties consisting in inspecting the various posts, garrisons, military schools, and military departments of colleges to which officers are detailed, and the money accounts of disbursing officers; (3) the quartermaster's department (1 brigadier-general, 4 colonels, 8 lieutenant-colonels, 14 majors, and 30 captains), whose duties consist in constructing and repairing quarters and other public buildings, roads, etc., furnishing transportation and supplying fuel, forage, clothing, and material; (4) the subsistence department (1 briga-

dier-general, 4 colonels, 3 lieutenant-colonels, 8 majors, 12 captains), furnishing supplies of food (principally the ration), and certain other articles; (5) the judge advocate-general's department (1 brigadier-general, 1 colonel, 3 lieutenant-colonels, and 3 majors), who attend to questions of law and assist in revising charges and court-martial proceedings; (6) the medical department; (7) the pay department; (8) the Corps of Engineers, part of the line in European armies, but forming a closed corps in the U. S., recruited exclusively from the highest graduates of the military academy, mainly employed in time of peace on river and harbor work, a few in charge of repairs to forts or serving with the battalion of engineers, and one on the staff of the commander of each military department in the country; (9) the ordnance department (corresponding to the construction branch of European artilleries), employed in the various arsenals, work-shops, and gun-foundries, one on the staff of each department commander; (10) the signal corps; (11) the post chaplains. The chiefs of these departments, together with a certain number of officers of each, constitute a kind of staff to the Secretary of War and the general of the army. An intelligence bureau has been organized at the War Department. Each military department commander usually has one officer of each staff department on his staff: quartermasters, commissaries, and surgeons are also located in the large cities in charge of dépôts, etc. Each department commander has also his personal aides—a major-general 3, a brigadier-general 2.

Each regiment has also a regimental staff, comprising the adjutant and quartermaster of the regiment, detailed from the lieutenants for four years. Each post, moreover, has a post adjutant and a post quartermaster and commissary, detailed by the commanding officer from the lieutenants of the post.

Beaugé, *Manuel de législation, d'administration et de comptabilité militaires* (1892).

Revised by JOHN P. WISSE.

Staffeldt. ADOLF WILHELM SHACK, von; poet; b. on the island of Rügen, Germany, 1769; studied in the military academy at Copenhagen, and entered the Danish army. In 1791 resigned, and studied law, archaeology, and the history of art at Göttingen, after which he spent several years in travel. In 1800 he returned to Denmark, and held important Government positions there until his death in 1826. His earliest collections of poems (1803 and 1808) attracted little attention at the time of their appearance, and on account of their depth of thought and frequent obscurity of language they have never won general popularity. Unlike Oehlenschläger, Staffeldt continued to be strongly influenced by German romanticism. Among his later works are the romances *Troubadouren*; *Trende Nætter* (Three Nights); *Roserne* (The Roses); and *Indvielsen* (The Consecration). See his *Collected Poems* (2 vols., Copenhagen, 1843). D. K. D.

Stafford: county town of Staffordshire, England; on the Sow; 29 miles N. N. W. of Birmingham, and 133 N. W. of London (see map of England, ref. 9-G). Among the churches are St. Mary's, restored by Sir G. Scott in 1845, and St. Chad, originally of Saxon origin, restored 1855-58. Shoemaking is carried on. Stafford returns one member to Parliament. Pop. (1891) 20,270.

Stafford, WILLIAM HOWARD, Viscount: statesman; b. in England, Nov. 20, 1612; was brought up a Roman Catholic; married a sister of Baron Stafford, to whose title Howard succeeded. During the civil war Stafford adhered to the royal cause, but after the Restoration often opposed in the House of Peers the measures of the court; was intimate with Shaftesbury, and was, on account of his religion, selected by the infamous Titus Oates as one of his victims. Accused of participation in the "Popish plot" by Oates in his first examination before the House of Commons, Stafford surrendered himself on the following day, and was committed to the Tower with four other accused noblemen Oct. 30, 1678. On Nov. 30, 1680, his trial for high treason was begun before the House of Lords, Sir Heneage Finch (afterward Earl of Nottingham) presiding as lord high steward. Stephen Dugdale and one Turberville, the chief witnesses, swore that Stafford had offered them rewards to participate in a conspiracy against the life of the king, and Bedloe, Dangerfield, and Denis offered confirmatory testimony.

Stafford defended himself with spirit, but he was convicted Dec. 7, by 25 votes against 31, four of the Howard family being of the majority. Stafford was executed on Tower Hill, Dec. 29, 1695, protesting his innocence in terms which carried great weight with the spectators. His widow was committed to prison, and his eldest son, Earl of Stafford, by James II. (1688), but the title became extinct on the death of his fourth son in 1792. The attainder was reversed by act of Parliament in 1694, and Sir George William Jennings was recognized as Baron Stafford in 1825.

Revised by F. M. COZBY.

Staffordshire: a west midland county of England; area, 1,160 sq. miles. The central part of the county is low and undulating, but in the north and the south the ground rises and the surface becomes hilly. The soil is generally cold, clayey, and not very productive. The coal-fields are very rich in the northern and eastern parts of the county; iron, copper, and lead are found, together with marble, freestone, and an excellent potter's clay. With respect to its manufactures, chiefly china, earthenware, and iron, this county is the third in rank in England. Seven members are returned to Parliament. Pop. (1891) 1,083,273.

Stafford Springs: borough; Talbotton, Conn.; on the W. H. Hartford river, and the Central Vt. Railroad; 30 miles N. by W. of Williamstown, 30 miles N. of New London (for location, see map of Connecticut, ref. 7-1). It contains manufactures of wooden and iron goods, Congregational, Methodist Episcopal, Protestant Episcopal, and Roman Catholic churches, high and graded schools, public library (founded in 1874), a national bank with capital of \$30,000, a savings-bank, and a weekly paper. Mineral springs add to the attractions of the place as a summer resort for invalids and pleasure-seekers. Pop. (1880) 1,081; (1890) 2,323.

Known as "Papa."

Staff-iron Family: See SPINULE-FREE FAMILY.

Stag, or Red Deer: the largest deer of Europe, the *Cervus elaphus*, a species much resembling the American wapiti. The male is called the *hart*, the female the *hind*, and the young the *calf*; the male under three years is called a *brocket*; under four, a *spotted*; under five, a *staggyrd*; and under six, a *stag*; so that strictly in sporting parlance, a stag is a red deer five years old. At six years he is a *hart of ten*, and when seven years old he is a *hart crowned*, and is considered fair game. The stag is distributed over the greater part of Europe, and is found in Northern Asia as far as the Lena and Lake Baikal. It inhabits Kaimoor, in England, and the Highlands of Scotland. Its horns are lofty and branching. In summer it is yellowish-brown; in winter, reddish-brown; the color deepens much with age, and in winter the old stags are nearly black. The flesh is inferior to that of the fallow deer. Revised by F. A. Lucas.

Stag-beetle, or Horn-bug: any one of several large beetles of the family *Lucanidae*, remarkable for the great size of the head and for the large horn-like mandibles. *Lucanus dama* of the U. S. is a well-known inhabitant of decaying wood, piles of chips, etc., and is capable of inflicting a severe bite. *L. cervus* is European.

Stage: See THEATER.

Stage-coach: See CARRIAGES.

Staggers: a popular name for several diseases of horses and sheep. Blind staggers in horses is a sort of epilepsy; mad staggers, an inflammation of the brain; grass staggers, an acute and dangerous gastritis. The treatment of the first is by setons about the head, but the disease is incurable. The second usually resolves treatment by means of blisters, cathartics, and thorough bleeding. The last-mentioned disease calls for active emetics and good-sized doses of calomel and opium. Staggers in sheep is caused by larvae of *Oedraea* in the nostrils; they may sometimes be removed by blowing into the nostrils snuff mixed with whisky.

Staghound: a large, rough-haired dog, much like the greyhound in general build, although somewhat heavier. It is strong, swift, and fearless, and the rival of the bloodhound in powers of scent. It is supposed to be a cross-breed of the bloodhound and the greyhound, and is used in Europe for hunting the stag, and, to some extent, in the western parts of the U. S. for hunting antelope. F. A. L.

Stagira [= Lat. = Gr. *Σταγίρα*]: town of Chalcidice, in Macedonia. It was a colony from Athens, but fell into decay during the Peloponnesian war. It was the birthplace of Aristotle, and in honor of his great tutor Alexander restored the city, but its prosperity was merely temporary.

Stagelle, Aristotle the: See ARISTOTLE.

Stagnellius, Jan. JAMES: poet; b. in Glesdina, Sweden, Oct. 14, 1738. Although at first strongly influenced by Phosphorism (see SWEDISH LAYMANS) and never entirely freeing himself from its obscurity, Stagnellius developed a style and view of life quite his own. All his works are treatises, in one form or another, of the different aspects of mysticism, and in these speculations he goes to the furthest extreme. In some of his aspects he has not happily been compared to Shelley. Among his works are *Walden den store* (1817); *Lilje i Svanen* (Lilies of Swans, 1821), his most characteristic collection of poems; *Martyrerna* (The Martyrs, 1821), his best drama; and *Durchskärningen* (The Sacrament, 1822). D. Apr. 13, 1823. His collected works were published in 1867-68 (11 vols., Stockholm).

D. K. DOOK.

Stahl, FRIEDRICH JULIUS: jurist; b. in Munich, Jan. 18, 1802, of Jewish parents; embraced Christianity in 1839; studied law at Würzburg, Heidelberg, and Erlangen; was appointed Professor of Jurisprudence in 1832 at Ratisbon, and in 1840 at Berlin. His specialty was the philosophy of law, and in his system he was a disciple of Schelling. Assuming that human reason is incapable of arriving at a positive conception of truth by itself, he deduced the ideas of state, government, etc., from the doctrines of Christian revelation, and bases the authority of officials and the obedience of citizens on a divine ordinance. As a member of the upper house of the Prussian Diet he became the leader of the feudal and aristocratic party during the period of reaction which followed the abortive revolution of 1848 in Berlin. D. at Brückmann, Bavaria, Aug. 10, 1881. His principal works are *Philosophie des Rechts* (4 vols., 1830); *Entwurf des Christlichen Staats* (1847); *Was ist Revolution?* (1833).

Stahl, GEBR. KASER: chemist and physician; b. at Ansbach, Bavaria, Oct. 31, 1800; studied medicine at Jena; was appointed physician to the Duke of Weimar in 1837, Professor of Medicine at the University of Halle in 1864, and physician to the King of Prussia in 1878. D. in Berlin, May 14, 1874. He invented a theory of phlogiston which was generally adopted, and considered valid up to the time of Lavoisier. (See CHEMISTRY.) His principal works are *Experimenta et Observationes Chemicae* (1731) and *Theoria Medica Vera* (1707).

Stahr, ADOLF WILHELM THOMAS: author; b. at Prenzlau, Brandenburg, Prussia, Oct. 22, 1805; studied classical languages and literature at Halle; was appointed professor at the gymnasium of Oldenburg in 1836; settled in 1832 at Berlin, where he married the authoress Emily Lewald in 1855. He was a very prolific writer; his numerous books and articles for periodicals treat subjects of antiquity and modern times, history and art, critically and in a descriptive manner. Some of his works have been translated into English, as, for instance, *Troja, oder Kunst, Künstler, und Kunstwerke der Alten* (2 vols., 1854-55), in *The Crayon* (New York, 1858-59); and his somewhat superficial but cleverly written biography of Lessing, *G. E. Lessing, sein Leben und seine Werke* (2 vols., 1850), by Prof. E. F. Evans, of Michigan University (Boston, 1866). He wrote the text to Kaulbach's *Goethe's Gallerie* (part I, Goethe's *Frauenthalten*). His *Oldenburgische Theaterschau* (2 vols., 1845) drew great attention to the stage of Oldenburg. D. at Wiesbaden, Oct. 9, 1876.

Revised by JULIUS GORDON.

Staigg, RICHARD MURRELL: painter; b. in Leeds, England, Sept. 17, 1817; removed to the U. S. in 1841; became a mechanic at Newport, R. I., where he took lessons in painting from Washington Allston and Jane Stuart; became eminent as a miniature-painter, a branch of art which he subsequently relinquished for genre-pictures and compositions. Among his best productions are *The Crayon-scraper*, *Cat's Cradle*, *Knitting*, *The Love-letter*, *The Soldier's Grimoire*, and *News from the War*. D. at Newport, R. I., Oct. 11, 1881.

Stained Glass: See GLASS.

Stainer, Sir JOHN: composer and organist; b. in London, June 6, 1840; studied entirely in England; entered the choir of St. Paul's Cathedral when seven years of age, remaining until his voice broke in 1856, playing the organ on occasion. He occupied several positions as organist till 1872, when, on the resignation of Sir John Goss, he was appointed organist of St. Paul's, and remained until 1888, when he was obliged to resign on account of failing eyesight. In that year he was knighted, and on the death of

Sir F. A. Gore Ouseley in 1889 was appointed to succeed him as Professor of Music in Oxford University. His degrees and honors are as follows: Mus. Bac. Oxon. 1859; B. A. 1863; Mus. Doc. Oxon. 1865; M. A. 1866; Hon. Mus. Doc., Durham, 1885; Chevalier of the Legion of Honor 1878. He is also honorary member of the Royal Academy of Music and honorary fellow of the Tonic Sol-Fa College. His compositions are chiefly sacred and include three sacred cantatas, *The Daughter of Jairus*, Worcester festival, 1878; *St. Mary Magdalene*, Gloucester festival, 1883; *The Crucifixion*, 1887; the oratorio *Gideon*, an early work; and many church anthems and services. He has also written several theoretical works, a treatise on the *Music of the Bible*, and a *Dictionary of Musical Terms*. D. E. HERVEY.

Stair, JAMES DALRYMPLE, Seventh Baron and First Viscount: jurist; b. at Drummurichie, Ayrshire, Scotland, in May, 1619; graduated M. A. at the University of Glasgow 1637; obtained a commission as captain in the Scottish army, but at the age of twenty-two accepted the professorship of philosophy at Glasgow, which he held till 1647; was admitted an advocate at the Scottish bar Feb., 1648; was secretary to the commissioners sent to treat with Charles II. at Breda 1649-50; became a lord of session July 1, 1657; was knighted by Charles II. 1660, and confirmed as lord of session Feb. 13, 1661; resigned office 1663 from unwillingness to subscribe the declaration against the Covenants of 1638 and 1643 appended to the oath of allegiance, but his resignation was declined, and he was made a baronet June, 1664; became lord president of the court of session Jan., 1671; refused to take the new test oath, and was removed from his offices 1681; published in that year his *Modus Litigandi* and *The Institutions of the Law of Scotland*—a work which has been called the Scottish Blackstone; becoming involved in a dispute with Claverhouse he was forced to flee to Holland Oct., 1684; prepared there his *Decisions of the Lord of Council and Sessions 1661-81* (Edinburgh, 2 vols. folio, 1683-87); published at Leyden his Latin treatises *Physiologia Nova Experimentalis* (1686); received a pardon 1686; accompanied the Prince of Orange to England 1688; was reinstated in the presidency of the court of session, and made Viscount Stair Apr. 21, 1690; published an *Apology* for his political course (1690) and a *Vindication of the Divine Perfections* (1695). D. in Edinburgh, Nov. 29, 1695.

Stair, JOHN DALRYMPLE, First Earl of, better known as the Master of Stair, son of Viscount Stair: b. in Scotland about 1648; was admitted as advocate in the court of session Feb., 1672; was one of the council for the Earl of Argyll on his trial for treason 1681; was twice imprisoned between 1681 and 1685; was received into favor on the accession of James II., by whom he was made lord advocate 1685 and lord of session and lord justice clerk 1686; supported the Revolution 1688; was a leading Scottish member of the Convention Parliament Mar., 1689; was one of the three commissioners sent to London to offer the crown of Scotland to William and Mary May, 1689; was reappointed lord advocate 1690; became one of the Secretaries of State for Scotland 1691; plotted the massacre of GLENCOE (q. v.), Jan., 1692, for which act he was dismissed from office 1695 and censured by a parliamentary committee of inquiry, but was never subjected to prosecution; succeeded his father as Viscount Stair in 1695; was sworn of the privy council on the accession of Anne 1702; was created Earl of Stair Apr. 8, 1703; was one of the commissioners who negotiated the treaty of union between Scotland and England 1706, and was mainly instrumental in passing that measure through the Scottish Parliament. D. Jan. 8, 1707. See *Graham, Stair Annals* (1875).

Stair, JOHN DALRYMPLE, Second Earl of: soldier; b. in Edinburgh, July 20, 1673; had the misfortune in boyhood to kill his elder brother by the accidental discharge of a pistol; educated at the University of Leyden, where he was distinguished for scholarship; entered the army as a volunteer under the Earl of Angus, and commanded the Cameronian Regiment at the battle of Steinkirk 1692; was aide-de-camp to the Duke of Marlborough at Venloo and Liège 1702; succeeded to the earldom 1707; obtained command of the Scots Greys; was commissioned general; distinguished himself at Ramillies and Oudenarde 1706, and at Malplaquet 1709; withdrew from the army in 1711; became privy counselor and representative peer for Scotland 1714; was appointed commander-in-chief of the forces in Scotland on the accession of George I. (1715); was ambassa-

dor to France 1715-20; resided on his estate at New Liston, Scotland, and devoted himself to scientific agriculture 1720-40; was made field-marshal commander-in-chief of British forces in Flanders and ambassador extraordinary to the States-General of Holland 1741; won the battle of Dettingen June 27, 1743, and subsequently filled several important public posts under the Walpole administration. D. in Edinburgh, May 9, 1747. The *Memoirs of the House of Dalrymple*, published from family papers (1876), contains important historical data.

Stalactites [from Gr. *σταλακτός*, dropping, oozing out in drops, deriv. of *σταλάω*, to drop]: icicle-like masses of lime, limonite, chalcidony, pyrites, etc., attached to the roofs of caverns; they are formed by the evaporation of water holding these substances in solution. Stalactites sometimes form columns reaching from floor to roof of high chambers; sometimes they imitate curtains, waterfalls, etc., and constitute notable features in some of the most famous caves. The name *stalagmite* (Gr. *στάλαγμα*, a drop) is given to accumulations of material of the same nature as stalactites, but deposited on the floors of caverns. This sometimes forms continuous sheets over the surface, sometimes rises into columns, which meet and blend with the stalactites above. Stalactites are often tubular, and, indeed, generally begin to form as tubes, since the solid matter held in solution by a drop of water when precipitated by evaporation forms a ring at the base and outside of the drop.

Revised by ISRAEL C. RUSSELL.

Staley, Cady, Ph. D., LL. D.: civil engineer and educator; b. at Scotch Bush, Montgomery co., N. Y., Dec. 12, 1840; educated at Union College. He has been in engineering work on the Central Pacific Railroad, Professor of Civil Engineering in Union College 1867-86, and dean of the faculty, and since 1884 president of the Case School of Applied Science in Cleveland, O. He is the editor of recent editions of Gillespie's *Surveys and Roads and Railroads*, and (with G. S. Pierson) author of *The Separate System of Sewerage* (1886).

Stalker, JAMES, D. D.: minister; b. at Crieff, Perthshire, Scotland, Feb. 21, 1848; was educated at the University and New College of Edinburgh, Universities of Berlin and Halle; minister of St. Brycedale Free church, Kirkcaldy, 1874-87; since 1887 of St. Matthew's, Glasgow. He was Cunningham fellow at New College 1874, and Lyman Beecher lecturer at Yale Theological Seminary 1891. Dr. Stalker has published *The Life of Jesus Christ* (Edinburgh and New York, 1879; many later editions; translated into several foreign languages); *The New Song: Sermons for Children* (1883); *Life of St. Paul* (1884; several later editions); *Imago Christi* (1889; 7th edition, 1894; translated into Norwegian, German, Japanese, and other languages); *The Preacher and his Models*, Lyman Beecher lectures (New York, 1891; 2d ed. 1892); *Men and Morals* (1892); *The Four Men and Other Chapters* (1892); *The Trial and Death of Jesus Christ* (1894). C. K. HORT.

Stalwarts: a name applied to the section of the Republican party that in 1881 opposed the administration of President Garfield. The quarrel arose from the latter's appointment of a collector of the port of New York in opposition to the wishes of Conkling and Platt, the Senators from that State. The party was divided between the Stalwarts and "Half-breeds," as the friends of the administration were called, and this dissension helped the Democrats to win in the election of 1884. See *REPUBLICAN PARTY*.

Stamboul, *staam-bool*: the wealthiest, most populous, and important of the territorial divisions forming the city of CONSTANTINOPLE (q. v.), called Istamboul by the Ottomans. Stamboul is a triangular-shaped promontory, projecting eastward toward the Bosphorus from the mainland, and included between the Golden Horn and Marmora. It comprises thirteen of the fourteen *regions* or *climata* of the Nova Roma of Constantine. E. A. G.

Stamen [= Lat., liter., warp in an upright loom, thread, fiber, deriv. of *sta're*, stand; cf. Gr. *στήμων*, warp (in an upright loom), deriv. of *στήνω*, stand]: the pollen-bearing organ in plants. Morphologically it is a leaf, upon which one or more pollen-sacs (spore-sacs or sporangia) are produced. On account of its special function it is rarely an expanded structure, although it is so in water-lilies, cannas, and some other cases (Fig. 1, a). In its usual form (Fig. 1, b) the slender stalk (*filament*) is surmounted by the pollen-sac (*anther*), which at maturity contains many loose cells, the

POLLIN. (g, h). In *Thalictrum* (g) several pollen-sacs are attached to the under side of the petiole stamen, while in *Gentiana* (h)

FIG. 1.—Stamen: a, waterlily; b, anemone; c, *Thalictrum*; d, *Gentiana*; e, *Pinks*; f, *Allium*; g, *Tradescantia*; h, *Thalictrum*; i, *Thalictrum*; j, *Anemone*; k, *Anemone*.

the two sacs are attached by the tips only. In *Pinks* (e) and the pinks the sacs are attached at the back of the leaf-like stamen. Other forms are shown in f to k, the most curious being found in *Anemone* (j), where the sacs are long and spirally twisted.

When young, the pollen-sacs are composed of uniform tissue, but soon certain cells in vertical rows become differentiated (Fig. 2, b, c), and eventually by subdivision produce the pollen-cells. At maturity there may therefore be one, two, or four cavities (Fig. 2, a) containing pollen, and this is set free by the longitudinal rupture of the anther (Fig. 1, b + k), or by the opening of a terminal or lateral pore (Fig. 1, i).

When associated with the petal in the same flower the stamens are usually below it (hypogynous), but by the adhesion of the floral parts they may be above it (epigynous). Normally they are separate from one another, but in some cases they are more or less united by their filaments, as in peas and beans, or even by their anthers, as in the *Compositae*. See *FLOWER*.

CHARLES E. DODGE.

Stamford: town and city; Fairfield co., Conn.; on Long Island Sound, Mill river, and the N. Y., N. H. and Hart. Railroad; 34 miles N. E. of New York, 78 miles S. W. of Hartford (for location, see map of Connecticut, ref. 13-D). The main part of the town lies in a valley, with hills on three sides and the Sound on the S. The harbor has been improved by the U. S. Government and is suitable for vessels of large draught. There is a daily steamboat line to New York. At Shapton Point, on the shore, are fine cottages, hotels, and other public resorts, and the Stamford Yacht Club building. The city comprises four-fifths of the population of the town, and has an excellent water-supply from Trinity Lake, sewerage system, paid police and fire departments, well-organized public-school system with high-school building erected in 1895, several private boarding and day schools and seminaries, a hospital and home maintained by St. John's church (Protestant Episcopal), the Ferguson Library, 2 national, a State, and 3 savings-banks, electric-light and railway plants, and a daily and 3 weekly

newspapers. The town and city have a combined bonded debt of \$600,000. There are extensive lumber-mills, a wood-mill, a pottery, and manufacturing of boots, builders' hardware, building appliances, post-office equipments, glass, stoves, shoes, patent medicines, chemicals, straw hats, carriages, and other articles. Stamford was settled in 1641; had its name changed from the Indian, *Hippowam*, in 1642; and was incorporated as a borough in 1830 and as a city in 1890. The assessed valuation of city property in 1895 was \$17,000,000. Pop. (1880) 11,209; (1890) 15,700; (1895) estimated, 19,000. (ROBERT WHITAKER.)

Stammering [from O. Eng. *stamian*, *stamian*, *stammering*; cf. O. H. Germ. *stammeln*; Germ. *stammeln*, whose root appears in Goth. *stammus*, *stammering*, in Germ. *stammeln*, make to halt (*stammeln*), and in *engsteln*, violent, unbroken]; an affection of the faculty of speech characterized by irregular, imperfect, or spasmodic action of the muscles concerned in articulation. It is in reality a choreiform, often hysterical, condition of the muscles concerned, a defective power of co-ordination. It may be manifested under two somewhat different forms. In the one there is a difficulty in beginning the enunciation of words, and this is shown especially in regard to those words which begin with what are called the "explosive consonants" (b, p), and which require the sudden opening of the lips. In the other form the word is begun, but after the enunciation of a syllable there is a spasmodic, and for a time uncontrollable, repetition of the same syllable. To this variety the term *stuttering* is sometimes applied. Stammering is one of the mimic diseases, and may be acquired by cohesions in speech or by association with others similarly affected, or even by mocking such persons. In the majority of cases it disappears after the attainment of adult age, probably in consequence of the constant efforts of the subject to improve his habit of speaking. It is generally increased by emotional disturbances, especially fright and apprehension, and is much mitigated, and often cured, by the patient acquiring confidence in himself, never attempting to speak in a hurry or when the chest is empty of air, or by reading measured sentences slowly and with deliberation. Stammerers never have any difficulty in singing, for they know that a certain definite manner is to be observed, and this gives them the confidence they require. The affection is sometimes permanently removed in time by the patient performing some trifling muscular action contemporaneously with the enunciation of the words over which he stumbles. Thus he can sometimes prevent the fault by moving a finger at the very instant that he begins to utter the word. Revised by W. PARRER.

Stamp Acts: laws requiring that stamps purchased from the government be placed on certain legal documents. In the history of the British colonies in North America the term Stamp Act refers to a law passed by the British Parliament Mar. 22, 1765, "for granting and applying certain stamp duties and other duties in the British colonies and plantations in America." It took effect from Nov. 1, 1765, but was the occasion of such excitement, protests, and open resistance in most of the colonies that it was repealed Mar. 18, 1766, and a bill of indemnity for those who had incurred penalties was passed June 6 of the same year.

Stamp-mill: See GRINDING AND GRINDING MACHINERY.

Stamps: official marks set upon things chargeable with some duty or tax, showing that the tax has been paid. These stamps may be either embossed, or printed separately and made adhesive by being gummed on the back. The British Government has long required the use of such stamps on checks, receipts, bank drafts, and legal documents of all kinds, and during the civil war in the U. S. (1861-65) a similar use of stamps was made for revenue purposes. Stamp duties were also levied during the same period on proprietary articles, incense matches, and a great variety of other commodities. Internal revenue stamps are used in the U. S. only for such articles as tobacco, snuff, cigars, ales, etc., and since 1894 for playing-cards.

Postage-stamps are also of two kinds: (1) those that are impressed on envelopes, newspaper wrappers, and post cards, and (2) adhesive labels. Their use is an evidence of prepayment of postage. Before their introduction it was the custom to take letters to the nearest post-office and prepay the postage or tax in cash; the postmaster then stamping such mail matter as prepaid. The introduction of the postage-stamp did away with this cumbersome method by enabling the corresponding public to purchase in advance the evidence of prepayment, and facilitated not only corre-

spondence, but also the work of the postal authorities by obviating the necessity for a separate handling of each piece of mail matter.

The first introduction of postage-stamps for regular issue took place in Great Britain on May 6, 1840, and was the result of the earnest efforts of Sir Rowland Hill, who had fought for three years in the House of Commons for postal reform. Prior to that time, James Chalmers, of Dundee, Scotland, had invented an adhesive label intended to be used as a postage-stamp, but he was unable to introduce his invention, and the real credit must remain with Sir Rowland Hill, who carried through successfully his scheme for the reduction of postage, and at the same time the introduction of evidences of prepayment. It is true that Sir Rowland Hill did not attach so much importance to the adhesive label as to prepaid envelopes, and his fame rests on the Mulready envelopes (engraved by W. A. Mulready), representing Britannia sending letters to all parts of the world; these were first placed on sale on May 6, 1840. The envelopes were received with ridicule throughout the United Kingdom, and were soon dropped out of use, the adhesive label taking their place.

It was in France that the first attempt was made to prepay letters by means of a cover, envelope, or band at a fixed rate. De Velay, master of petitions, was the inventor; the idea of cheap postage might also be ascribed to him, although it was only for the Paris local post. A postal system already existed in France and other countries, but no city had a delivery system. De Velay obtained in 1653 a special privilege from King Louis XIV. to establish a little post-office in Paris, and placed numerous boxes all over the city, which were to be emptied each day. He announced that in order to expedite the service his clerks would not receive any money, but that the letters must be accompanied by a ticket showing prepayment, which ticket must be attached to, wrapped around, or placed within the letter in such a manner that the clerk could easily remove it; when an answer was required the sender had to attach or inclose a second ticket. These tickets cost one sou (about a cent) each, and the principal office for their sale was at the palace. The postal system had some success as a curiosity, but it was in advance of its time, and, besides suffering from the indifference of the public, it was soon attacked by evil-wishers; the boxes were soiled, malicious people going so far as to put rats, mice, and even worse things into them, and the enterprise was soon abandoned.

Some collectors of postage-stamps accept certain letter-sheets stamped in the kingdom of Sardinia in 1818 and 1819. These stamps, however, represent the exact contrary of a postage-stamp, as they indicate the amount of tax paid by the writer for the privilege of sending his letter by other means than the regular postal service; this is a revenue tax, and not in any sense a postal tax.

The example of Great Britain was first imitated in the U. S., where the proprietors of local delivery companies began to sell postage-stamps to their patrons as early as the year 1842. The first one was the City Dispatch Post, owned by Alexander M. Greig, operating in the city of New York; in Aug., 1842, he sold the entire outfit to the U. S. Government, which retained his design for the postage-stamp, a three-quarter face portrait of Washington, changing the inscription to read "United States City Despatch Post." The Government of the U. S. was rather tardy in accepting the new system, and until 1847, when the first stamp for general use was issued, the postal service depended either upon the old cumbersome system or the individual enterprise of the postmasters in various towns, who, on their individual responsibility, had postage-stamps printed and sold to the patrons of their respective offices. This occurred in the following cities: Baltimore, Md. (1845); Brattleboro, Vt. (1846); Millbury, Mass. (1847); New Haven, Conn. (1845); New York, N. Y. (1845); Providence, R. I. (1846); St. Louis, Mo. (1845). It is of interest to note that before the introduction of postage-stamps in the U. S. the post-office authorities in large cities kept regular running accounts with all well-known merchants. Business houses sent their mail matter to the post-office daily, and the cost of postage was calculated by the clerks and charged up to the merchants, bills being rendered at the end of each month.

Among established governments, Brazil was the first to follow the example of Great Britain with an issue of stamps for general postal use. These appeared on July 1, 1843, and were of three values, 30, 60, and 90 reis; each

bore simply the numeral of value on an engine-turned groundwork. Postage-stamps were first issued by France on Jan. 1, 1849, in a set of two, bearing an allegorical head of Liberty; and by Belgium in Nov., 1849, in a set of two, with the portrait of King Leopold. Bavaria, which issued stamps in Nov., 1849, was the first of the many states and principalities which now constitute the German empire to adopt the new system; Prussia and Hanover followed in 1850, and Baden, Württemberg, and Saxony in 1851. The Princes of Thurn and Taxis, who for centuries had enjoyed the monopoly of the postal service in certain of the German states, issued their first stamps in 1852. These continued in use till 1868, or until the formation of the North German Confederation, which included all the states that employed the service of the Princes of Thurn and Taxis, with the addition of Prussia and Saxony. On the formation of the German empire in 1871 all the separate postal administrations, except those of Bavaria and Württemberg, were superseded by the service of the central Government.

The federal administration in Switzerland did not issue postage-stamps until 1850, but of the separate cantons Geneva and Zurich had issued them in 1843 and Basel in 1845. Most of the other prominent governments in Europe followed in rapid succession, but some were very slow in accepting the reform, as appears from the following list: Spain (1850), Italy (1851), Denmark (1851), Portugal (1853), Norway (1854), Russia (1857), Sweden (1858), Greece (1861), Turkey (1863).

In North America, Canada, New Brunswick, and Nova Scotia made their first issues in 1851, Mexico in 1856, and Newfoundland in 1857. In South America Brazil was followed by British Guiana in 1850, Chili in 1852, and Uruguay in 1856, while Ecuador waited until 1865, Bolivia until 1867, and Paraguay until 1870.

Every colony in Australia adopted the reform early in the fifties, while Mauritius, the Cape of Good Hope, and Natal were the first in Africa, Egypt being next in order in 1866, with a set of seven stamps bearing a representation of a pyramid. India in 1854 was the first government to issue postage-stamps in Asia, using the familiar portrait of Queen Victoria.

The processes employed for the manufacture of postage-stamps are extremely varied in character, every style of engraving and printing having been used in various parts of the world. Among them the most used are engraving on steel, on copper, on zinc, and on wood, surface-printing from steel, copper, and wood, and lithography. All early issues of postage-stamps were imperforate or with plain edges, until in 1848 Henry Archer, in London, invented a machine for perforating. The first experiments were in the nature of trials, and the device was not officially used until 1854, when Mr. Archer sold his device to the British Government.

The number of stamps issued by different countries, as well as the extremes, both high and low, of denomination, vary greatly. The U. S. enjoys the distinction of having had in regular use at one time a larger number than any other country. From 1873 to 1884, besides the regular issue for general use, which consisted of 13 adhesive stamps, 13 envelopes, and 2 wrappers, each department of the Government had its own series, with a total of 92 adhesives, 12 envelopes, and 2 wrappers; besides these there were 7 postage-due and 24 newspaper and periodical stamps. This enumeration does not take into account minor varieties of die or the different colors of paper used for the envelopes. The postage-stamps which have the lowest face value are the $\frac{1}{2}$ milésimo stamp of Cuba and Porto Rico and the $\frac{1}{2}$ centimo of Spain, each representing about $\frac{1}{100}$ th of a cent. These are used for local newspaper postage. The stamp of largest denomination is the £20 of South Australia, which is available for both postage and revenue purposes.

Overprinted Stamps, etc.—One of the most interesting developments of the use of postage-stamps is the means employed by postmasters in various parts of the world for providing a particular value the stock of which may have become exhausted. The usual method is to surcharge or overprint stamps of some other value with the new value intended to be given to the stamp, and the first instance of such practice appears in France in 1850, when, to supply the demand for a 25-centime stamp, to meet a newly established rate of postage, a quantity of 20-centime stamps, which had been printed by error in blue, were overprinted with the figures "25." These were not, however, placed in circulation, as a new supply of the desired value was prepared in time.

Bavaria, 1849. The first German stamp.

Guadalajara, 1867. Issued during Mexican revolution.

New Caledonia, 1854. The worst engraved stamp.

Dominica, 1882. Stamp cut in half and surcharged.

Victoria, 1890. Unpaid letter stamp.

Obock, 1894. Camel post.

Portugal. Type introduced in 1871 and afterward used for all colonies.

Labuan, 1880. Stamp surcharged by pen and ink.

Surcharged stamps.

San Marino, 1894. Issued to celebrate the opening of a new palace.

Pacific Steam Navigation Co. Also used by Peru as an experiment.

Portugal, 1893. Jubilee issue in memory of Prince Henry the Navigator.

Salvador, 1892. Issued to commemorate the Columbus celebration.

Mauritius, 1847. One of the greatest rarities.

Brazil, 1843.

New Brunswick, 1851.

New South Wales, 1850. View of Sydney harbor.

REPRESENTATIVE TYPES OF POSTAGE-STAMPS.

As almost all such overprinted or surcharged stamps are made to supply a temporary want, in the nature of things they are rarer than the ordinary issues, and the increase in the number of collectors in recent years has opened this as a profitable field for speculation. Collectors and dealers in various parts of the world have succeeded in inducing postmasters and other officials to surcharge small quantities of stamps, supplying a few to the public for its correspondence and turning over the remainder to the speculator. In many such cases, the postmaster has participated in the profits. Another means of providing a temporary or provisional issue is to cut in half, in quarters, or in other sections stamps of a higher denomination, using the fraction to indicate such portion of the value of the original stamp as the fraction will represent. The most prolific producers of surcharged stamps have been the British and French colonial postmasters; but the Colonial Office in London has taken steps to stop further abuse by requiring responsible officials to maintain a sufficient supply of every value, imposing a fine in case this requirement should be neglected.

Memorial stamps.—Another interesting feature of the use of postage-stamps, and a direct result of the wide and varied interest manifested in all parts of the world, is the issue of a special kind of stamps on the occasion of any celebration or jubilee. The first issue of this description was made in Great Britain in 1867, on the fiftieth anniversary of the accession of Queen Victoria to the throne. The example was not followed for some years, but it has become fashionable to make such issues, and among them may be mentioned especially the Columbus issue made by the U. S. in 1892 to celebrate the discovery of America, and similar issues made by the Argentine Republic, Nicaragua, Salvador, Honduras, Venezuela, and Porto Rico in 1892 and 1893. All of these were legitimate issues, made to commemorate an event of real importance, but they have opened the eyes of other governments to the speculative value of such stamps, and 1894 saw a flood of jubilee and commemorative issues. Pivotal examples of such abuse are an issue in the republic of San Marino to commemorate the opening of a new palace, and an issue in Portugal to commemorate the 700th anniversary of the birth of St. Anthony of Padua, both of which are avowedly made solely on account of the profits to be derived from the sale to postage-stamp collectors.

Stamp-collecting.—The collecting of postage-stamps for amusement is said to have begun about the year 1850, or as soon as it was noticed that stamps of different colors, designs, and values were being received in mails from various parts of the world. The value and rarity of any particular specimen was not taken into account at all, and one frequently heard of exchanges made among collectors in years gone by of specimens, some of which are now worth hundreds of dollars, for others which still have no appreciable value. As the practice of collecting became more general, the study of postage-stamps became more and more minute, and the collector of early times can hardly realize the extent to which the study of postage-stamps has been carried. Every minute variation of paper, style of printing, perforation, gum, water-mark, etc., is considered as marking a different issue, and in some instances as many as fifty distinct variations of a single stamp are collected where in former years a single specimen would have been considered fully representative of the type.

Full recognition is also accorded to certain classes of adhesive labels which can not, in any sense, be justly termed postage-stamps, but in some instances represent the exact contrary. Prominent among these are the postage-due stamps issued by many countries for the convenience of the postal administration, and which indicate that the postage has not been prepaid, and the newspaper and periodical stamps issued by the U. S., which are never sold to the public but are used only as vouchers in the books of the Post-office Department.

The literature of philately (as the study of postage-stamps is called) embraces every section of the globe, and monthly and weekly journals are published even in India, China, Australia, and Africa. The chief books of reference are *A Catalogue for Advanced Collectors of Postage-stamps*, by the Scott Stamp and Coin Company (New York); *Catalogue de Timbres-Poste*, by J. H. Moens (Brussels); and the publications of the London (England) Philatelic Society. The leading philatelic journals are *The American Journal of Philately*, Scott Stamp and Coin Company, New York; *The London Philatelist* (The London Philatelic Society); *The Monthly Journal* (Stanley Gibbons, London); *Le Tim-*

bre-Poste (J. H. Moens, Brussels); *Der Philatelist* (Dresden); and *Illustriertes Briefmarken-Journal* (Göteborg, Scat, Leipzig).

Stanberry: city; Ramsey co., Minn., on the Omaha and St. L. Railway; 50 miles N. by E. of St. Joseph, 110 miles S. E. of Omaha, Neb. (for location, see map of Missouri, ref. 1-D). It is in an agricultural region, and contains a State bank with capital of \$20,000, a private bank, and a semi-weekly, a bi-weekly, a monthly, and 2 weekly periodicals. Pop. (1880) 1,307; (1900) 2,033.

Stanbery, Henry: jurist; b. in New York, Feb. 20, 1806; graduated at Washington College, Pennsylvania, in 1819; admitted to the bar in 1824; removed to Ohio and became attorney-general of the State in 1846; appointed Attorney-General of the U. S. in 1866 under the administration of President Johnson, for whom he acted as leading counsel in the impeachment trial of 1868; returned to the practice of his profession at Cincinnati. D. in New York, June 23, 1881.

Standbridge, John: teacher and author; b. at Heyford, Northamptonshire, England, about 1480; became perpetual fellow of New College, Oxford, 1491; first usher of the free school connected with Magdalen College about 1486, and afterward for many years its head master. D. about 1525. He was the first author of school-books that were extensively printed and used in England, though now so rare as to have become bibliographical curiosities. Among them were *The Decencies of Master Standbridge's new Makynge* (printed before 1500); *Encheyron Kelminum, sive Vocabularium* (of which at least eight editions were printed by Wynken de Worde); and *Vocabula Magistri Standbridge* (1510).

Standard Time: See TIME.

Standish, Miles: soldier; b. in Lancashire, England, about 1584; claimed to be descended from the knightly family of Standish of Duxbury Hall, Lancashire; served on the Continent, probably with the English forces; became a captain; settled in Leyden, and, though not a member of the English Church or congregation, accompanied the Pilgrims of the Mayflower to New England 1620; lost his wife, Rose, during the first winter; is said by tradition to have employed his friend John Alden to negotiate his marriage with the fair Priscilla Mullins (see Longfellow's *Courtship of Miles Standish*), with the well-known result that Alden married the maiden; rendered important services to the colonists in preserving them from the open and secret hostilities of the Indians, having with his own hand killed at Weymouth (1620) Pocahont, an Indian chief who had planned a massacre; visited England as agent for the colony 1625, returning with supplies 1626; broke up the settlement at Merry Mount (see MORRIS, THOMAS) 1628; was one of the original proprietors and settlers of Duxbury, having given that name to the town in memory of the seat of his English ancestors; was for the remainder of his life either magistrate or a member of the board of assistants to the governor, and took part in the settlement of Bridgewater 1642. D. at Duxbury, Oct. 3 A. S., 15 S. S., 1656. He was of small stature and choleric temper, and possessed great energy and force of will. One of his swords and other relics are preserved in the Pilgrim Hall, Plymouth. A monument to his memory stands on the commanding eminence in South Duxbury, formerly called Captain's Hill, from having been the place of his residence. Many incidents of his career are given, with a partial genealogy of his descendants, in Justin Winsor's *History of Duxbury* (1849). Also see De Costa, *Footprints of Miles Standish* (Charlottesville, Mass., 1904).

Stand-pipe: a vertical cylindrical tower connected with a water-supply system to provide pressure and sometimes to serve partly as a storage-tank. Stand-pipes are made of wrought-iron or steel plates riveted together, and usually vary in diameter from 12 to 20 feet, although a few have been built 50 feet in diameter. The height depends upon the pressure required, and is usually from 60 to 150 feet, although some are nearly 250 feet high. Sometimes the upper part of the tower constitutes a tank supported by a frame, the water being carried to it by a pipe of much smaller diameter. A stand-pipe is used only in connection with a pumping system, and is most effective when placed near the pump.

The water is forced up against the head in the stand-pipe, and this in turn maintains the pressure throughout the pipe system. Stand-pipes are sometimes destroyed by wind or by accidents due to other causes. For an account of these, see a series of articles by Pence in *Engineering News* during 1884.

MANSFIELD MERRIMAN.

Stanfield, WILLIAM CLARKSON: landscape and marine painter; b. at Sunderland, Durham, England, in 1793; d. at Hampstead, May 18, 1867. He was a sailor in the British navy, became a scene-painter while still a young man, and taking up painting of landscape and naval battle scenes attained success and was elected a Royal Academician in 1835. Among his most celebrated works are *Battle of Trafalgar* (1836) and *Battle of Roveredo* (1851). W. A. C.

Stanford: town; capital of Lincoln co., Ky.; on the Lexington and East. Railway; 38 miles S. by W. of Lexington, 104 miles S. E. of Louisville (for location, see map of Kentucky, ref. 4-H). It is in an agricultural region, and contains woolen, flour, and grist mills, the Stanford Female College, a national bank with capital of \$200,000, a banking and trust company with capital of \$200,000, and a semi-weekly newspaper. Pop. (1880) 1,213; (1890) 1,885.

Stanford, CHARLES VILLIERS: composer; b. in Dublin, Ireland, Sept. 30, 1852; went to Leipzig to study in 1874, and then to Berlin, returning home in 1876. His compositions include several symphonies, much sacred music in large forms, the two oratorios *The Three Holy Children*, for the Birmingham festival of 1885, and *Eden*, for the Birmingham festival of 1891; three operas—*The Veiled Prophet*, produced at Hanover, Feb. 6, 1881, *Savonarola*, Hamburg, Apr. 18, 1884, and *The Canterbury Pilgrims*, for the Carl Rosa Company, Apr. 28, 1884; the cantata *Elegiac Ode*, 1884, being a setting of Walt Whitman's *Burial Hymn*; music to the Greek plays *Eumenides* and *Edipus Tyrannus*; and Psalm cl. in cantata form (1887). He received the degree of Mus. Doc. from Cambridge in 1883, succeeded Otto Goldschmidt as conductor of the Bach Choir in 1885, and was appointed Professor of Music in Cambridge University Dec., 1887, on the death of Sir George Macfarren. D. E. HERVEY.

Stanford, LELAND: capitalist and philanthropist; b. at Watervliet, N. Y., Mar. 9, 1824; received a common-school education; studied law, and was admitted to the bar in 1849; soon afterward removed to Port Washington, Wis., where he practiced law till 1852, when he went to California and engaged in gold-mining; settled in San Francisco in 1856, and entered into business with three of his brothers. He first appeared in politics as a delegate to the convention at Chicago in 1860 which nominated Abraham Lincoln for the presidency; was elected Governor of California in 1861, and in his inaugural address urged the importance of building the Pacific Railroad, and a company for that purpose, of which he was elected president, was formed on July 1 of that year. He superintended the construction of that part of the road that crossed the mountains, spending personally more than \$20,000,000 on a stretch of roadway of 100 miles. He became interested in the construction of other railways and in the development of the agriculture and manufactures of California. He was elected to the U. S. Senate as a Republican for the term 1885-91. With his wife he founded LELAND STANFORD JUNIOR UNIVERSITY (q. v.). D. at Palo Alto, Cal., June 20, 1893.

Stanhope, CHARLES MAHON, F. R. S., Third Earl Stanhope and Viscount Mahon: inventor; b. in London, England, Aug. 3, 1753; entered Parliament 1780; succeeded to the peerage 1786; was noted for his radical opinions; declared himself a republican, and laid aside the insignia of nobility; distinguished himself by his scientific researches; made many improvements in the art of printing, and in 1816 invented the Stanhope printing-press. D. in London, Dec. 15, 1816.

Stanhope, EDWARD: statesman; second son of the fifth Earl of Stanhope; b. in London, Sept. 24, 1840; educated at Harrow and Oxford; called to the bar 1865; entered Parliament 1874; Under-Secretary of State for India 1878-80; vice-president of the committee of council on education 1885; president of the Board of Trade 1885-86; Secretary of State for the Colonies under Lord Salisbury 1896; Secretary of State for War in his second administration 1887.

Stanhope, Lady HESTER LUCY: daughter of Charles, third Earl Stanhope; b. at Chevening, Kent, England, Mar. 12, 1776; was for ten years a member of the family of her

uncle, William Pitt, to whom she acted as confidential secretary until his death in 1806; received thereafter a pension of £1,200, upon which she resided some years in Wales; proceeded in 1810 to Syria; visited Jerusalem, Damascus, Baalbec, and Palmyra; acquired by her magnificent and singular ways of living the respect and veneration of the Arabs, who treated her almost as a queen; established herself in 1814 in the deserted convent of Mar Elias, 8 miles from Sidon, upon a crag of Lebanon; adopted the dress and style of an emir, having at her command a guard of Albanians, over whom she exercised an absolute authority; became a benefactress to political refugees and to the poor of every kind; exerted considerable political influence; and practiced astrology. D. at Mar Elias, June 23, 1839. Her *Memoirs* (3 vols., 1845) and *Seven Years' Travels* (3 vols., 1846) were published by her physician, Dr. Meryon.

Stanhope, JAMES, First Earl Stanhope: soldier; b. in Paris, France, in 1673; resided in Spain, where his father was minister during 1690-94; entered the army 1694; was wounded at the siege of Namur 1695; served in Flanders until the Peace of Ryswick; was elected to Parliament 1702; took part in the expeditions of 1702 and 1704 in Spain; was a brigadier-general at the siege of Barcelona 1705; major-general 1707; commander-in-chief in Spain, and took Port Mahon, Minorca, 1708; defeated the Spaniards at Almenara and Saragossa (Aug., 1710), but was forced to surrender to the Duke of Vendôme at Brihuega, Dec. 8, 1710; was appointed Secretary of State on the accession of George I., 1714; became First Lord of the Treasury and Chancellor of the Exchequer 1717; was created Viscount Stanhope of Mahon July 2, 1717, and Earl Stanhope Apr., 1718; was again Secretary of State, and took part in negotiating the Quadruple Alliance 1718. D. in London, Feb. 5, 1721.

Stanhope, PHILIP DORMER: See CHESTERFIELD.

Stanhope, PHILIP HENRY, Fifth Earl Stanhope, better known as Lord Mahon: statesman and author; b. at Walmer, Kent, England, Jan. 31, 1805; was a grandson of Charles, the third earl; graduated from Christ Church, Oxford, 1827; was elected to Parliament in 1830; was Under-Secretary of State for Foreign Affairs (the Duke of Wellington being the secretary) in the first Peel ministry 1834; was secretary to the board of control in the last year of the second Peel ministry 1845-46; supported the repeal of the corn-laws; introduced and carried the copyright act of 1842; was chosen president of the Society of Antiquaries 1846; was defeated at the parliamentary elections of 1852 in consequence of having voted with the protectionists against the modification of the navigation laws; succeeded to the earldom Mar. 2, 1855; founded the Stanhope prize for the study of modern history at Oxford 1855; was chosen lord rector of the University of Aberdeen 1858, and one of the six foreign members of the Academy of Moral and Political Sciences at Paris May 11, 1872. D. at Bournemouth, Hampshire, Dec. 24, 1875. Author of *History of the War of Succession in Spain* (1832); *History of England from the Peace of Utrecht to the Peace of Versailles, 1713-83* (7 vols. 8vo, 1836-53); *Essai sur la Vie du Grand Condé* (privately printed, 1842, and afterward appeared in English as *The Life of Louis, Prince of Condé*, 1845); *The Life of the Right Hon. William Pitt, with Extracts from his Unpublished Correspondence and MS. Papers* (4 vols., 1861-62; 4th ed. 1867); and a *History of England, comprising the Reign of Anne, until the Peace of Utrecht* (1870). Several fragments of his great work have been separately published, as *The Forty-Five, being a Narrative of the Rebellion in Scotland in 1745* (1851) and *The Rise of Our Indian Empire* (1858). Lord Stanhope edited, with notes, *The Letters of Philip Dormer Stanhope, Earl of Chesterfield* (4 vols., 1845); *The Memoirs of Sir Robert Peel* (2 vols., 1856-57).

Stan'islas Augustus, King of Poland: See PONIATOWSKI.

Stanislas Leszczyński. -lesh-tseñ'skée: King of Poland; b. at Lemberg, Galicia, Oct. 20, 1677, of one of the oldest and wealthiest families of the Polish nobility; held a high position at the Polish court, and was palatine of Posen when the war broke out between Charles XII. of Sweden and Augustus II. of Poland and Saxony. By the diplomatic negotiations which he carried on between Augustus and Charles he won the favor, and even the friendship, of the latter, and when, after the complete defeat of Augustus, Charles declared the Polish throne vacant, Stanislas was by his influence elected King of Poland in 1705. He was a noble character, and not without talent as a ruler, but after

the disease of Charles II. Poland in 1709 he was compelled to flee from Poland, where even his private fortune was confiscated. He joined his friends at Bender, and was in 1714 made governor of the duchy of Sandomierz, but after the death of Charles in 1738 he fled to France, and settled at Walsenburg in Alsace. In 1735 his daughter, Marie Louise, was married to Louis XV., and at the death of Augustus II. in 1763 he was re-elected King of Poland by French influence. Russia, however, was opposed to his restoration, and by the intervention of a powerful Russian army Augustus III. was raised to the Polish throne. After a desperate resistance at Danzig, where he was besieged by the Russians, he fled for the second time from his native country, but by the Peace of Vienna (1765) his family estates were restored to him, he received the duchy of Lorraine as a pension, and retained the title of King of Poland. He subsequently resided at Lunville or Nancy, where he held a brilliant court, gathered scientific men around him, founded splendid educational institutions, erected magnificent public buildings, and was generally called *Le Bien-aimé*. D. Feb. 24, 1796. Among his *Œuvres du Philanthrope bienfaisant* (4 vols., 1767) is a little essay, *Voix d'un Citoyen*, in which he predicts the division of Poland.

Stanislaw: town and railway junction in the province of Galicia, Austria; pleasantly situated between two branches of the Riksdal, in the center of a very fertile and well-cultivated plain; 75 miles S. E. of Lemberg (see map of Austria-Hungary, ref. 4-L). It has several good educational institutions and some manufactures and trade. Pop. (1900) 22,500.

Stanley, Arthur Penrhyn, D. D., LL. D.: clergyman and author; son of Bishop Edward and nephew of the first Lord Stanley of Alderley; b. at Alderley, Cheshire, England, Dec. 18, 1815; was a favorite student of Dr. Thomas Arnold at Rugby 1833-34; gained a scholarship at Balliol College, Oxford, 1834; took the Newdigate prize for his English poem, *The Oppress*, the Ireland scholarship, and a first class in classics (1837); a fellowship at University College 1838; and was tutor for twelve years, and examiner 1841; obtained the chancellor's Latin essay 1839 and the chancellor's English essay and the Elberton theological essay 1840; took orders in the Church of England 1840, affiliating himself with the Broad Church party; was selected preacher to the University of Oxford 1846-47; secretary to the Oxford University commission 1850-52; canon of Canterbury 1851-58, Regius Professor of Ecclesiastical History at Oxford 1856-64, and canon of Christ Church 1858-64; became chaplain to Prince Albert 1864, to Dr. Tall, Bishop of London, 1857, and to Queen Victoria and the Prince of Wales 1862; declined the archbishopric of Dublin 1863, was installed dean of Westminster Jan. 9, 1864, and was elected lord rector of the University of St. Andrews Nov., 1874. He made a tour in the East, visiting Egypt and Palestine, 1859-61, and again as chaplain and traveling companion to the Prince of Wales 1862; was prominent as a defender of broad-mindedness in the Church of England in the controversies connected with the celebrated *Essays and Reviews* (1861), Bishop Colenso's work on the *Pentateuch* (1863), and the later series of ecclesiastical prosecutions; was an active promoter of charitable, missionary, and educational enterprises and of biblical, antiquarian, and scientific researches, cultivated friendly relations with Dissenters to an extraordinary degree, and was much more popular with them than in his own church; and was for some years regarded as the leading representative of the progressive school of British theology. Dec. 29, 1868, he married Lady Augusta Bruce (1822-76), daughter of the Earl of Elgin, and the most intimate friend of the Queen. Her death broke his heart. He was a sensitive, highly gifted, poetic, spiritual, pure, and very picturesque personality. He was the author of many publications, which have passed through numerous editions and been reprinted in America. The chief of these are *The Life and Correspondence of Thomas Arnold* (1844); *Sermons and Essays on the Apostolic Age* (1847); *The Epistles of St. Paul to the Corinthians, with Critical Notes and Dissertations* (2 vols., 1855; 4th ed. 1876); *Historical Memorials of Canterbury Cathedral* (1855); *Sinai and Palestine, in connection with their History* (1856; 20th ed. 1874); *Lectures on the History of the Eastern Church* (1861); *New York, 1862; new ed.* (1870); *Lectures on the History of the Jewish Church* (2 vols., 1862; vol. II., 1865, vol. III., 1870); *Historical Memorials of Westminster Abbey* (1867; 4th ed. 1874); *Lectures on the History of the Church of Scotland* (1872); and *Christian Institutions* (1878). He was a voluminous con-

tributor to reviews and periodicals, furnished a valuable series of biblical biographies to Dr. William Smith's *Dictionary of the Bible*, and published many notable sermons. See the bibliography in Prothero's *Stanley* (vol. II., 375-382). He was a member of the Bible revision committee. In 1878 he visited the U. S., and in 1879 published a volume of addresses and sermons delivered there. D. in the sanctuary, Westminster, July 18, 1891, and was buried in Henry VII.'s chapel, Westminster Abbey. See his *Life* by H. K. Prothero (London and New York, 1894, 2 vols.).

Revised by S. M. JACKSON.

Stanley, David Edmund: soldier; b. at Chester, Wayne co., O., June 1, 1828; graduated at the U. S. Military Academy July 1, 1852, and was appointed brevet second lieutenant in the Second Dragoons. As a cavalry officer he served almost constantly on frontier duty, and in 1869 was complimented by Gen. Scott in general orders for a successful fight with the Comanches. On the outbreak of the civil war in 1861, having attained the rank of captain in the First Cavalry, he was sent to the field of active operations in Missouri, and on Sept. 29 was commissioned a brigadier-general of volunteers. He commanded the second division of the army of the Mississippi at the capture of Island No. 10; in the Corinth campaign, including the battle of Farmington and pursuit of the enemy upon the evacuation of Corinth; at the battles of Iuka (Sept. 19) and Corinth (Oct. 3-4). In Nov., 1862, he was appointed chief of cavalry of the army of the Cumberland, and the same month promoted to be major-general of volunteers, and was engaged in the battle of Murfreesboro, the Tullahoma campaign, including the action of Shelbyville and frequent minor engagements until Sept., 1863, when compelled by sickness to take a short leave. Returning to duty in November, he was assigned to the first division of the Fourth Army-corps, and held command of the corps from July, 1864, until the close of the war. In Sherman's invasion of Georgia he bore a conspicuous part in the severe and almost constant fighting from Dalton to Atlanta, being wounded at the battle of Jonesboro, Sept. 1. During the month of October his command was engaged in pursuit of Hood's army until the 27th, when it was detached from the army of Gen. Sherman to strengthen Gen. Thomas at Nashville, to whom was intrusted the duty of opposing an invasion of Tennessee. With numerous skirmishes the Fourth and Twenty-third Corps had arrived at Franklin, Tenn., Nov. 30, where, being closely followed by the enemy, a stand was made and a notable victory gained. During the fight Gen. Stanley was severely wounded. He was breveted lieutenant-colonel, colonel, brigadier-general, and major-general for gallantry in battle. On Feb. 1, 1866, he was mustered out of the volunteer service, and resumed his commission in the regular army, having become major of the Fifth Cavalry in 1863. He was appointed colonel Twenty-second Infantry July, 1866; in command of Yellowstone expedition 1872-73; of various military posts 1873-84; promoted to be brigadier-general U. S. army Mar. 24, 1884; commanded the district of New Mexico and the department of Texas until he was retired June 1, 1892.

Revised by JAMES MARVIN.

Stanley, Edward John, second Baron Stanley of Alderley: statesman; b. at Alderley Park, Cheshire, England, Nov. 13, 1802; studied at Eton; took the degree of B. A. at Oxford, 1823; entered Parliament as a Liberal 1831; was Under-Secretary of State for the Colonies 1833-34; patronage Secretary of the Treasury 1835-41; paymaster-general of the forces several months in 1841; Under-Secretary of State for Foreign Affairs in the Russell administration 1846-51; was raised to the House of Peers as Baron Eddisbury 1848; succeeded to his father's title 1859; held the conjoint offices of paymaster of the forces and vice-president of the Board of Trade a few weeks in 1852, and again 1853-55; was president of the Board of Trade 1855-56, and Postmaster-General 1860-65. D. in London, June 16, 1869.

Stanley, Frederick Arthur, G. C. B., Baron Stanley of Preston: b. Jan. 15, 1841; educated at Eton. He is the second son of the fourteenth Earl of Derby; was formerly a captain in the Grenadier Guards. He was civil lord of the Admiralty Aug. to Nov., 1868; financial secretary to the War Office 1874-77; Secretary to the Treasury 1877-78; Secretary of State for War 1878-80; Secretary of State for the Colonies 1885-86; and president of the Board of Trade 1886-89. He was Governor-General of Canada May 6, 1888, to July 15, 1893. He married (May 31, 1864) Lady Constance Villiers, eldest daughter of the fourth Earl of Clarendon;

was created Baron Stanley of Preston in the peerage of Great Britain in 1896, and on the death of his brother in 1898 became sixteenth Earl of Derby. NEIL MACDONALD.

Stanley, HENRY MORTON, D. C. L.: African explorer; b. near Denbigh, Wales, in 1841, of humble parentage. He was placed in the poorhouse, where he remained until his thirteenth year, after which he taught in a school, and subsequently shipped as cabin-boy for New Orleans, where he was adopted by a merchant, whose name he assumed instead of his own, which was John Rowlands. His adoptive father having died without a will, and the civil war breaking out, he enlisted in the Confederate army; was taken prisoner; volunteered in the U. S. navy, and became acting ensign on an ironclad. After the close of the war he went as a newspaper correspondent to Turkey and Asia Minor, and in 1868 accompanied the British expedition to Abyssinia as correspondent of *The New York Herald*, a portion of his correspondence being subsequently embodied in a volume. In Oct., 1869, being then in Spain, he was employed by the *Herald* to head an expedition to learn the fate of Livingstone, the African explorer, from whom only vague intimations had been heard for two years. He reached Zanzibar in Jan., 1871, and toward the end of March set out for the interior, with a company of 192 men. In November he found Livingstone, who was living near Lake Tanganyika, and furnished him with supplies for further explorations. After having explored the northern portion of the lake, Stanley set out on his return journey in Mar., 1872, reaching England in July, where he was received with distinguished honor, the Queen sending him a gold snuff-box set with diamonds, and the Royal Geographical Society awarding to him in 1873 its patron's medal. Tidings having been received of the death of Livingstone in Central Africa, Stanley was placed at the head of an expedition, the cost of which was jointly undertaken by *The New York Herald* and the *London Daily Telegraph*, to explore the lake region of equatorial Africa. He left the coast in Nov., 1874, at the head of 300 men, and after many hardships and some severe contests with the natives reached Lake Victoria Nyanza Feb. 27, 1875, having in the meantime lost 194 men by death and desertion. He circumnavigated the lake in a boat brought with him in pieces, and found it to be a single large lake, and not, as supposed by Burton and Livingstone, a group of lagoons, thus confirming the opinions of Speke and Grant. He started Apr. 17, 1875, to continue his explorations in the direction of Lake Albert Edward Nyanza. He arrived at the mouth of the Congo river Aug. 12, 1877, having explored its whole course; returned to the Congo in 1879, at the head of a Belgian international expedition; lectured in the U. S., on Africa, in Dec., 1886; returned to Congo Free State in 1887 with an expedition for the relief of Emin Bey, whom he found on the Albert Nyanza Apr. 28, 1888. He returned with Emin toward the east coast in May, 1889, and reached the coast himself on Dec. 6 of the same year. On the return trip he discovered the Ruwenzori Mountains S. of Albert Nyanza. On his return to England in 1890 he received honorary degrees from the universities, and a special medal from the Royal Geographical Society. In the following year he visited the U. S. and Australia on lecturing tours, and returning to London in 1892 he unsuccessfully stood for North Lambeth as a Unionist candidate. His principal works are *How I found Livingstone* (London and New York, 1872); *Coomassie and Magdala* (1874); *Through the Dark Continent* (1878); *The Congo, and the Founding of its Free State* (2 vols., 1885); *In Darkest Africa* (1890); *My Dark Companions* (1893); and *Slavery and the Slave-trade in Africa* (1893).

Revised by M. W. HARRINGTON.

Stanley, THOMAS: classical scholar; b. at Comberlow, Hertfordshire, England, in 1625; was carefully educated at home; graduated at Cambridge 1641; studied law at the Middle Temple; published in 1647 a volume of *Poems and Translations* (from Anacreon, Bion, Moschus, etc.), frequently reprinted; issued his chief work, *The History of Philosophy, containing the Lives, Opinions, Actions, and Discourses of the Philosophers of every Sect*, in 4 vols., at intervals between 1655 and 1682 (2d ed. folio, 1687; best ed., with *Life of the author*, 4to, 1743), and in 1663-64 his elaborate edition of *The Tragedies of Æschylus*, with Latin translation, Greek scholia, and commentary, which long maintained its ground among English scholars (best ed. by Butler, 1809-16). D. in London, Apr. 12, 1678. See Brydges's edition of Stanley's *Poems with Life* (1814-15).

Stannard, HENRIETTA ELIZA VAUGHAN (Palmer): novelist; b. at York, England, Jan. 13, 1856; daughter of Rev. Henry Vaughan Palmer, rector of St. Margaret's, York; married, 1884, Arthur Stannard, a civil engineer. Her father had been an artillery officer before taking holy orders, and Mrs. Stannard's numerous fictions have dealt mainly with army life. Among these, published under the pseudonyms of John Strange Winter and Violet Whyte, are *Cavalry Life* (1881); *Regimental Legends* (1883); the very popular *Bootie's Baby* (1885); *Houp-la* (1885); *Army Society Life in a Garrison Town* (1886); *Garrison Gossip* (1887); and *A Siege Baby* (1887). H. A. BEERS.

Stannaries [from Lat. *stan'num*, tin]: in general, tin mines; in a special sense, those of Cornwall and Devon, concerning which there are peculiar laws and usages. The court of the stannaries is very ancient, exercising a jurisdiction in the time of Lord Coke which was "guided by special laws, by customs, and by prescription time out of mind." It was established in order that the workers in these mines might sue and be sued in their own court, "and not be drawn from their business to their own private loss and to the public detriment by attending their lawsuits in other courts." The early charters, records, and acts of Parliament relating to this subject are summarized in Coke's *Fourth Institute*, chap. xlv. The principal modern statutes bearing upon the stannaries are 6 and 7 Will. IV., c. 106, as amended by subsequent acts, which regulates the constitution and the procedure in these courts, and 33 and 38 Vict., c. 19, amended by 50 and 51 Vict., c. 23, relating to mining partnerships within their jurisdiction. The judges of the stannaries court are appointed by the Duke of Cornwall (the Prince of Wales), or, when there is none of full age, by the crown. See Bainbridge on *Mines*, ch. vi., §§ 8-5, and Batten's *Stannaries Act*. FRANCIS M. BURDICK.

Stannic Acid: a-hydrate, SnO(OH)₂, obtained from stannous oxide. See TIN (*Compounds of Tin*).

Stanovoi' Range [Russ. *Stanovoi Khrebet*, i. e. back-bone]: name given by Pallas to the mountains at the source of the Olekma, but since expanded to embrace the whole Siberian watershed between the Arctic and Pacific drainage systems. It is very imperfectly known, but appears to extend N. E. from near Urga, in North Central Mongolia, to the Chukchu Peninsula, a distance of 2,700 miles. It consists of parallel ranges of mountains with elevated plateaus, which are often very marshy, is more rugged on its eastern than on the western slopes, and is through much of its extent clothed with forests and rich in minerals. A principal range on the western side is the Yablonnoi Khrebet, which borders the plateau of Vitim. The highest point is Mt. Sokhondo (lat. about 50° N., lon. 110° E.), about 9,250 feet. MARK W. HARRINGTON.

Stanstead: the *chef-lieu* of Stanstead County, Quebec, Canada, and the terminus of a branch of the Boston and Maine Railway line, which runs through the Masawippi valley (see map of Quebec, ref. 6-C). It is close to the boundary-line of the U. S., which separates it from North Derby or Derby Line, Vt. It includes Stanstead Plain and Rock Island; in the former there is a Wesleyan College and several churches; in the latter are several factories. It is on the edge of a rich farming and grazing country. Pop. 4,200. J. M. H.

Stanton: city; capital of Montcalm co., Mich.; on the Detroit, Lans., and N. Railroad; 15 miles N. E. of Greenville, 62 miles N. W. of Lansing (for location, see map of Michigan, ref. 6-I). It is in an agricultural region, and contains a public high school, flour-mills, planing-mills, foundry, machine-shops, a private bank, and two weekly newspapers. Pop. (1880) 1,760; (1890) 1,352.

Stanton, EDWIN McMASTERS: lawyer and Secretary of War; b. at Steubenville, O., Dec. 19, 1814; admitted to the bar in 1836; reporter of the Supreme Court of Ohio 1842-45, reporting vols. xi.-xiii. of *Ohio Reports*. In 1845 he successfully and with distinction defended in the criminal court at Washington Caleb J. McNulty, clerk of the House of Representatives, tried for embezzlement. He first acquired national reputation as a lawyer in the important case of *The State of Pennsylvania vs. The Wheeling Bridge Company*, involving the question whether control of bridges over navigable rivers of the West flowing between the several States is vested by the Constitution in Congress or the State Legislatures. It was decided that Pennsylvania's interest in the controversy gave her standing in that court, and that regulation of bridges over navigable rivers of the

West is tested in Congress, exclusive of State control. Successive arguments in the case by Stanton were so marked by legal learning, logic, and eloquence that at once and at a comparatively early age he took place in the front rank of national lawyers. In 1806 he removed to Washington to attend to his practice before the U. S. Supreme Court, and in 1808 went to California and remained nearly a year as counsel for the U. S. in certain landcases involving many millions of dollars. Besides carrying in a successful issue those cases to which his employment especially related, his services were invaluable in the collection, collation, and translation of Mexican archives. The archives collected through his efforts furnished conclusive evidence of an organized system of fabricating land-titles carried on for a long time in California. The value of lands claimed under forged grants was estimated at not less than \$150,000,000. Afterward, however, these archives furnished the means of discrediting valid from forged grants, and enabled a successful defense to be made to every fraudulent claim.

In Dec. 1860, when active preparations were being made for secession and the indications as to the political future of the republic were appalling, Cass, Secretary of State, suddenly resigned, and Black, Attorney-General, succeeded him. Stanton, then in Cincinnati arguing a case before the U. S. circuit court, was appointed Attorney-General. Acceptance of the office involved relinquishment of profitable professional business and assumption of great responsibility, with little prospect of personal distinction. He accepted the office, and in it his attitude was that of resolute maintenance of national honor and determined opposition to treason. Only a handful of U. S. troops was assembled at Washington, and the residents of the capital were mainly in sympathy with secession. To a greater extent probably than any of his associates in the cabinet, Stanton perceived the danger of an attempt to prevent Lincoln's inauguration, to seize and hold the capital and insignia of government for the seceding States, and thus to exhibit the latter to the world as a government *de facto*, succeeding to the power and authority of the U. S. On Mar. 4, 1861, Stanton retired with the outgoing administration and resumed his profession. After the civil war had existed several months, patriotic citizens and eminent capitalists, without Stanton's knowledge, urged President Lincoln to place him in charge of the War Department. On Jan. 30, 1862, he became Secretary of War. Excepting a brief meeting in 1857 in Cincinnati, in a lawsuit in which they were both of counsel, there had previously been no intercourse between Lincoln and Stanton; but after the latter entered the War Department their mutual friendship and confidence grew with every day. The characteristics of Stanton's administration were integrity, energy, determination, singleness of purpose, and capacity to comprehend the magnitude of the insurrection and the labor and cost in blood and treasure involved in suppressing it.

After Lincoln's assassination and Johnson's accession to the presidency, Stanton was connected with the latter's administration for three years. He supported many measures which were vetoed by the President and re-enacted by Congress, including those for the establishment of the Freedmen's Bureau, for protection of civil rights, for admission of Colorado as a State, for organization of governments in insurrectionary States, and for conferring suffrage without regard to color in the District of Columbia. These differences of opinion and the continued adherence of Stanton to the Republican party and the President's separation from and avowed hostility toward it, led the President on Aug. 5, 1867, to notify Stanton that public considerations of a high character constrained him to request the latter's resignation; to which Stanton answered that public considerations of a high character, which alone had induced him to remain at the head of the department, constrained him not to resign before the next meeting of Congress. On Aug. 12 the President notified him of his suspension from office. After Congress convened, the Senate refused by a vote of 83 to 6 its concurrence in the suspension. Having received official information of this from the Senate, Stanton, on the next day (Jan. 13, 1869), resumed his office. On Feb. 21, 1869, the President undertook to remove him and to appoint Lorenzo Thomas Secretary of War *ad interim*. The Senate, sitting on the same day officially informed by the President of this action, resolved that under the Constitution and laws the President had no power to remove the Secretary of War and designate another officer to perform the duties of that office, and officially communicated this

resolution to Stanton. The House of Representatives immediately decided to impeach the President. In consequence of this action of both houses of Congress and the general apprehension of revolutionary purposes on the part of the President, Stanton refused to relinquish control of his department. After the trial and acquittal of the President under articles of impeachment, Stanton relinquished his office. The Senate on May 28 again resolved that he had not been legally removed, and based its confirmation of his successor, Gen. Schofield, upon Stanton's voluntary retirement. Soon afterward both houses of Congress passed a vote of thanks to him for his great ability, purity, and fidelity.

With his health shattered by his labors in the War Department, he resumed his profession and argued several important cases. The last was *Whitely vs. Hoover*, an important patent case, which, in consequence of Stanton's feeble health, was heard by Judge Swayne in Stanton's own library two weeks before the latter's death. He never again left his chamber. On Dec. 20, 1869, he was nominated by President Grant as an associate justice of the U. S. Supreme Court, and was immediately confirmed by the Senate; but on Dec. 24 he died without having entered upon the duties of his new office.

Revised by C. K. ARNOLD.

Stanton, Elizabeth (Cady): reformer; b. at Johnstown, N. Y., Nov. 12, 1815; daughter of Judge Daniel Cady; educated at the Johnstown Academy, where she studied with a class of boys; was fitted for college at the age of fifteen, and pursued her studies at Mrs. Willard's Seminary at Troy; had her attention turned to the disabilities of sex by her own educational experience and a study of Blackstone, Story, and Kent; married, in 1840, Henry R. Stanton (reformer, author, and State Senator; d. 1887); accompanied him to the World's Anti-Slavery convention at London; there made the acquaintance of Lucretia Mott; resided in Boston until 1847, when they settled at Seneca Falls, N. Y.; with Lucretia Mott signed the call for the first woman's rights convention, which met at her place of residence July 19-20, 1848, on which occasion the first formal claim of suffrage for women was made; circulated petitions for the married woman's property bill, and had a hearing before a legislative committee 1844; addressed the New York Legislature in 1834 on the right of suffrage, in 1860 in advocacy of divorce for drunkenness, and in 1867 both the Legislature and the constitutional convention, maintaining that during the revision of the constitution the State was resolved into its original elements, and that all the citizens had therefore a right to vote for members of that convention. Since 1869 she has frequently addressed congressional committees and State constitutional conventions. She canvassed Kansas in 1867, and Michigan in 1874, when the question of woman suffrage was submitted in those States; was one of the editors of *The Revolution*. Most of the calls and resolutions for conventions, addresses to women, legislatures, and Congress, have been from her pen. She was president of the national woman's rights committee 1855-63, of the Woman's Loyal League 1863, and of the National Association until she withdrew in 1892; spent several years in France and England, and spoke many times in the great conventions in England and Scotland, and at parlor meetings in London; contributed articles to *The Westminster Review* and to journals and magazines in the U. S. She was president of the first International Council of Women held in Washington in 1893. With Miss Susan B. Anthony and Mrs. Matilda J. Gage she is the author of *The History of Woman Suffrage* (3 vols., New York, 1881-86).

Susan B. Anthony.

Stanton, Thomas, M. A.: journalist; son of Mrs. Elizabeth Cady Stanton; b. at Seneca Falls, N. Y., Feb. 10, 1831; educated at the College of the City of New York and at Cornell University; was Berlin correspondent of *The New York Tribune* 1850; settled in Paris to engage in journalism; member International Jury, Paris Exposition, 1889; resident commissioner in France, Columbian Exposition, 1893; Chevalier of the Legion of Honor; translator and editor of *Le Goff's Life of Thiers* (New York, 1870); author of *The Woman Question in Europe* (1884) and of contributions to periodicals.

Stanwix, John: soldier; b. in England about 1680; entered the British army 1700; served as an officer of grenadiers and marines; became Lieutenant-colonel 1745; equerry to Frederick, Prince of Wales, 1740; was governor of Carlisle and its representative in Parliament 1759; became deputy quartermaster-general of the forces 1754; was made colonel commanding the first battalion of the Sixtieth Regi-

ment (Royal Americans) Jan. 1, 1756; was in command of the southern district of the American colonies, with headquarters at Carlisle, Pa., 1757; was appointed brigadier-general Dec. 27, 1757; was relieved by Gen. Forbes early in 1758, and intrusted (1758) with the erection of the important fortress known as Fort Stanwix at the "Oneida carrying-place" (now Rome) on Mohawk river, at an expense of £60,000, as a defense against incursions from the French in Canada; returned to Pennsylvania; was appointed major-general June 19, 1759; repaired and fortified the old fort Du Quesne at Pittsburg, securing the good will of the Ohio Indians; resigned his commission in America to Gen. Monckton May 4, 1760, and returned to England; was appointed lieutenant-general Jan. 19, 1761; was made lieutenant-governor of the Isle of Wight and colonel of the Eighth Foot, and was elected member of Parliament for Appleby. He was lost at sea in Dec., 1765, while crossing the Irish Channel from Dublin to Holyhead in a packet.

Stan'yhurst, RICHARD: historian and theologian; b. in Dublin about 1545; educated at University College, Oxford; studied law; returned to Ireland; married, became a Roman Catholic, and went to the Continent. On the death of his wife he became a priest, and was appointed chaplain to Archduke Albert, governor of the Spanish Netherlands. D. at Brussels in 1618. He translated into English heroic verse *The First Four Bookes of Virgils Aeneis* (1588); furnished a *Description of Ireland* to Holinshead's *Chronicles*; wrote historical treatises (in Latin) on Ireland, and English and Latin theological works.

Staphyllin'idæ: the ROVE-BEETLES (q. v.).

Stapleton, THOMAS, D.D.: theologian, b. at Henfield, Sussex, England, in 1535; educated at Canterbury and Winchester schools and at New College, Oxford, where he was admitted perpetual fellow 1554; took orders in the Church; became a Roman Catholic; was appointed by Queen Mary prebendary of Chichester; retired on the accession of Elizabeth to Louvain, where he acquired publicity by his polemical writings against Calvin and Beza, Jewel, Horne, Whitaker, and other Protestant divines; became Regius Professor of Divinity at the University of Douay, where he had already become doctor of theology; returned to Louvain, where he was appointed divinity professor as successor to Baius. D. at Louvain, Oct. 12, 1599. His best-known works are *Principiorum fidei doctrinalium Demonstratio, Selectio principiorum fidei doctrinalium, Defensio auctoritatis ecclesiasticæ, De Justificatione, De magnitudine Ecclesiæ Romanæ, Propugnaculum fidei primitivæ Anglorum, Antidota Evangelica, Antidota Apostolica, Promptuarium Morale, Promptuarium Dogmaticum, Tres Thomæ*. Cardinal Duperron looked on him as the greatest of the polemical theologians, and Döllinger says that he was the greatest champion of the Church against the new doctrines. His works were published at Paris, 1620 (4 vols. fol.).

J. J. KEANE.

Star: See STARS.

Star-anise: See ANISE-SEED.

Star-apple Family: the *Sapotaceæ*, a small family (400 species) of gamopetalous, dicotyledonous shrubs and trees, mostly latex-bearing. The flowers are regular and hermaphrodite in the axils of the leaves, and have one or two series of stamens, and a superior two to five celled, few-ovuled ovary. They are mainly tropical and sub-tropical. In the Southern U. S. there are nine or ten species, five of which are small trees of the genus *Bumelia*. "Several species of this family are useful to man. The fruits of *Lucuma mammosa*, the marmalade of the West Indies, are a very agreeable food, as are those of *Achras sapota* (the sapodilla-plum) and various species of *Chrysophyllum* (star-apples), which are much sought after in the Antilles." Some species of *Bassia*, the butter-trees, yield a fatty substance by pressure of the seeds. Gutta-percha is obtained from *Isonandra gutta*, a large tree of the East Indies, by the evaporation of its milky juice. CHARLES E. BESSEY.

Starch [deriv. of *starch*, stiff < O. Eng. *stearc*, strong] ($C_6H_{10}O_5$ or $C_{12}H_{20}O_{11}$): a substance (also called *fecula*, *amidon*, and *amylum*) widely diffused in the vegetable kingdom, being found in almost every plant, at least at some period of its development. It is especially abundant in some families of plants, and often occurs in large quantities in the seeds, pith, stalks, bark, bulbs, tubers, roots, etc. There are two other substances found in plants which resemble starch in many respects—the inulin, which occurs

in the dahlia, elecampane, dandelion, chicory, mustard-seed, etc., and the lichen-starch which is found in Iceland moss, carrageen-moss, and several of the lichen and fucus tribes of plants. See INULIN and LICHENINE.

Preparation.—Starch is extracted from a great variety of plants, chiefly from wheat, Indian corn, rice, potatoes, the root of manioc or cassava, *Jatropha manihot* (tapioca), the root of several species of the *Maranta* (arrowroot), and the pith of a great variety of palms (sago). Wheat-flour contains from 50 to 80 per cent. of starch. The starch is extracted from the whole wheat by "softening" in cold water and pressing under millstones or rollers, or in bags under water, as long as milky water runs off from it. This liquid, when left to itself, deposits starch containing gluten; the latter, however, dissolves for the most part in the supernatant liquid, which gradually turns sour; and on decanting this acid liquid, repeatedly stirring up the starch with fresh water, and leaving it to settle, it is at length obtained pure, and may be dried in suitable desiccating chambers. Corn-starch is extensively manufactured in the U. S. by soaking corn in water containing caustic soda or hydrochloric acid to dissolve the gluten, grinding, washing on sieves, etc. The cheapness and excellence of this starch has put an end to the importation of starch from foreign countries, and large quantities are now exported. Rice-starch is largely manufactured in Great Britain, France, and Belgium. The rice is first soaked in a weak lye, then ground, and washed on a sieve. Potato-starch is largely manufactured in Europe and in the U. S. Horse-chestnut starch is made in France. A solution of sodic carbonate is used to remove the bitter principle. The yield is about 20 per cent. For ARROWROOT, SAGO, and TAPIOCA, see those articles.

Properties.—"Starch is a white shining powder, soft to the touch, grating between the fingers or the teeth, sometimes consisting of amorphous masses, but more frequently of granules recognizable by the microscope. . . . Starch, so long as it retains its natural state of aggregation, is insoluble in water, alcohol, and ether; but when placed in contact with hot water, the water penetrates between the different layers of which the granules are composed, swelling them up and forming a gelatinous mass known as *starch-paste*, and used for stiffening linen, etc."—*Watts's Dictionary*.

Applications of Starch.—Starch is used for stiffening cotton and linen cloth, paper, etc. Wiesner says corn-starch possesses the highest, and potato-starch the lowest stiffening qualities. It is used for food in the form of arrowroot, tapioca, sago, etc., for making paste, for powdering the hair, for the manufacture of dextrin, glucose (corn-sirup), etc. See FOOD.

Revised by IRA REMSEN.

Star Chamber: an English high court of justice prominent in the fifteenth, sixteenth, and seventeenth centuries, supposed to have derived its name from the fact that the room in which it was held at Westminster was decorated with gilt stars. The first historical instance of the use of the title is in the reign of Edward III., when the chancellor, treasurer, justices, and others are mentioned as exercising jurisdiction in the "star chamber." Its powers are thought to have been derived from the council which in 1453 was recognized as having jurisdiction over all cases not determinable by common law, but which declined in power during the Wars of the Roses. By the act of 1488 Henry VII. empowered a committee of the council, consisting of the chancellor, treasurer, keeper of the privy seal, chief justices (or, in their absence, two other justices), a bishop, and a temporal lord to act as a court of justice with jurisdiction over cases in which the operation of the law was wrongfully impeded. It had the right to punish without a jury the misdemeanors of sheriffs and juries, and in spite of its arbitrary nature was of use in quelling the turbulent spirit of the great nobles and bringing in a period of good order. In Henry VIII.'s reign its powers were reabsorbed by the council, but thenceforth the composition of the court was uncertain. Its jurisdiction, which was equally vague, comprised in practice almost every class of offenses, and it could inflict any penalty short of death. The peculiar uncertainty of its legal rules made it the defense of absolute power, and under the Stuarts its arbitrary decisions and cruel punishments brought down upon it the popular hatred. It was abolished by the Long Parliament in 1641.

F. M. COLBY.

Stare Decisis, stā'rē-dēē-sī'sis [Lat.]: a shortened form of the maxim, "*stare decisis, et non quæla movere*"—"to stand by decisions and not to disturb matters once settled."

Ordinarily, it applies only to decisions of the court in which the question is again mooted, or to those of its superior. At times, however, the rule is followed with regard to decisions of inferior courts and even to decisions of executive departments, which have been acquiesced in by the public and under which rights have been acquired. (*Schell vs. Pausch*, 128 U. S. 923.) The reasons for the rule and its limitations are considered in the article on **PRECEDENTS** (p. 61).

FRANCIS M. BURGESS.

Starfish: any animal belonging to the class of *Echinodermata*, order *Asteroides*; characterized by having the body more or less plainly star-shaped, and without sharp distinction between the five or more rays or arms and the central disk. The body-wall is hardened with calcareous plates and spines; the mouth is in the center of the lower surface of the disk, and the vent, when present, is above. Each arm bears on its lower surface two zigzag rows of tubular suckers (ambulacra), by means of which the animal moves about or anchors itself; while at the tip of each ray is an ocellus. The round spot noticeable on the upper surface is a siphon (madreporite) through which water is admitted to tubes connected with the ambulacra. The spines of the starfish are separate, and the eggs, which are usually committed to the waves, undergo in most forms strange metamorphoses in their development. Starfish lack all hard structures to the mouth, and they eat by protruding the stomach, inserting it into the mollus upon which they feed. They are extremely destructive to oysters. See Alexander Agassiz, *North American Starfishes* (1877); *Development*, Pilsch, *Quarterly Jour. Microsc. Sci.* (1892); *Fishes*, Bulletin Mus. Comp. Zool. (n. s.), 1887. J. S. KINGSLEY.

Stargazers: marine fishes of the family *Uranoscopus*. The best known species is *Uranoscopus scaber* of the Mediterranean; *Asteriscopus stimpsoni* and *Uranoscopus y-gracius* are found on the Atlantic coast of the U. S., but most of the species are East Indian. They are spiny fishes, having the eyes on top of the head, whence the name. The cyprinodont fishes of the genus *Amblopleg*, found in Guinea, are also called stargazers. See **ASARLES**.

Starke, JAMES: soldier; b. at Londonderry, N. H., Aug. 28, 1729; became a farmer, and in 1762 was taken prisoner by the St. Francis Indians, but after six weeks was ransomed, having in the meantime gained so much favor with his captives that he was subsequently adopted into their tribe. In 1769 he was appointed a lieutenant in Rogers's Rangers; took part in Abercrombie's campaign in 1758, and in Amherst's reduction of Crown Point and Ticonderoga in 1759; early in 1775 was chosen a member of the New Hampshire committee of safety; as colonel of the New Hampshire troops took part in the battle of Bunker Hill; accompanied Montgomery's expedition to Canada 1775-76; joined Washington at Newton, N. J., Dec. 1776, and took part in the battle of Trenton. Being aggrieved at the action of Congress in regard to promotions, he resigned his commission in Aug., 1777. Upon the advance of Burgoyne from Canada, the authorities of New Hampshire commissioned him to raise a force for the defense of the State, which was then held to include Vermont. He attacked the Hessian colonel Donon near Bennington Aug. 16, 1777, routed him, and later in the day defeated a force under Col. Breymann. For this he received from Congress a commission as brigadier-general; served under Gates in the Saratoga campaign; was with Gates in Rhode Island in 1778-79, and in 1780 joined Washington at Morristown; was a member of the court martial for the trial of Maj. André, and in 1781 was placed in command of the northern department. After the close of the war he retired to his farm. D. at Manchester, N. H., May 5, 1822. His *Biography* was written by Edward Everett for Sparks's *American Biography*, and his *Life and Official Correspondence*, edited by his grandson, was published in 1860 (Concord, N. H.).

Starke, THOMAS: jurist; b. at Blackburn, England, Apr. 12, 1792; graduated at Cambridge, where he was senior wrangler and Smith's prizeman 1803; was called to the bar at Lincoln's Inn May, 1810; became Downing Professor of Law 1823, and a judge of the county court at Clerkenwell 1847. His most important service in a public capacity was his labor in a commission appointed for the amendment of the law, and for digesting it into a code, for which his fullness of information especially fitted him. D. in London, Apr. 15, 1849. Besides *A Practical Treatise on the Law of Abuses, Liabilities, and, incidentally, of Misdemeanors* (1812), *A Treatise on Criminal Pleading* (2 vols., 1814), and

A Practical Treatise on the Law of Evidence and Digest of Precedents in Civil and Criminal Proceedings (3 vols., 1824), which (especially the last) are his most important works and have been repeatedly reprinted, he published *Reports of Cases Determined at New Trials, King's Bench, and Common Pleas* (1817-22), and numerous magazine articles.

Revised by F. NEVINS ANDERSON.

Starkville: town; capital of Oktibbeha co., Miss.; on the Ill. Cent. and the Mobile and Ohio railways; 20 miles S. W. of Aberdeen, 35 miles W. of Columbus (for location, see map of Mississippi, ref. 5-H). It is in a stock-raising and hay-making region, is the seat of the Mississippi Agricultural and Mechanical College, and contains the Starkville Female Institute, a savings-bank with capital of \$25,000, and two weekly newspapers. Pop. (1880) 1,800; (1890) 1,725.

Starling [M. Eng. *sterlyng*, dimia. of *stare* < O. Eng. *star* (> Eng. *stare*, *starling*; O. H. Germ. *stara* > Mod. Germ. *star*, *starling*; cf. Lat. *sternus*, *starling*]; the *Sternus vulgaris*, a common European bird of the family *Sternidae*. It is a great favorite, especially with the Germans, who often have it caged, and teach it to whistle tunes and even speak words very plainly. It makes a nest of twigs, straw, grass, and roots in holes of rocks and buildings and in hollow trees. The bird is 84 inches long, black, with violet and green reflections and buff spots.

Revised by F. A. LUGER.

Starnina, GUERARDI: painter; b. in Florence in 1524; a pupil of Antonio Veneziano. After painting the history of St. Nicholas and St. Anthony on the ceiling of the Gualtari chapel in Santa Croce, he was taken to Spain by some Spaniards who were enthusiastic admirers of his art. In that country he worked for the king and other patrons, and returned to Italy rich and covered with honor. Of his frescoes for the chapel of St. Jerome in the Carmelite church, executed soon after his return, nothing remains but the *Death of St. Jerome*. When Pisa was conquered by the Florentine republic Starnina was commissioned to paint on the facade of the Gualtari palace an effigy of St. Denis, it being on his day that the city surrendered. He was one of the most consummate draughtsmen of his time. Masolino da Panicale, Masaccio, and Antonio da Pisano were his pupils. D. about 1497. W. J. SWANMAN.

Star-of-Bethlehem: the *Ornithogalum umbellatum*, a common spring garden-flower of the family *Liliaceae*. The genus includes many bulbous-rooted plants of the Old World and of Southern Africa, several of which are cultivated. The above-mentioned species (the white star-of-Bethlehem) is a native of Europe, and is sparingly naturalized in the U. S.

Revised by L. H. BAILEY.

Star of India: Order of the: a British order of knighthood, provided to reward distinction in the Government service in India. It was instituted in 1861, and reorganized in 1866 and 1873. It consists of the sovereign, the viceroy of India, and three classes of members, viz.: 1, knights grand commanders (G. C. S. I.); 2, knights commanders (K. C. S. I.); and 3, companions (C. S. I.). The badge of the order is a light-blue ribbon with white stripes and the motto "Heaven's Light our Guide."

Staroverski: See **PHILIPPINI**.

Starr, MILES ALLEN, A. M., M. D., Ph. D.: neurologist; b. in Brooklyn, N. Y., May 16, 1854; educated at Princeton College (A. B. 1876, A. M. 1879, Ph. D. 1884), and at the College of Physicians and Surgeons, New York (M. D. 1880); studied at the Universities of Berlin, Heidelberg, Vienna, and Paris; was Professor of Nervous Diseases, New York Polyclinic, 1886-88, and has been Professor of Diseases of the Mind and Nervous System, College of Physicians and Surgeons, New York, since 1888; is attending and consulting physician to a number of hospitals; corresponding secretary of New York Academy of Medicine 1899 to 1905; president New York Neurological Society 1902-04. He delivered the Middleton Goldsmith lectures of the New York Pathological Society in 1887, his subject being *Multiple Neuritis*. Among his works are *Familial Forms of Nervous Diseases* (New York, 1899); *Lectures on Insanity* (1901); and *Brain Surgery* (New York, 1903).

S. T. ARMSTRONG.

Stars [M. Eng. *stare* < O. Eng. *steara*; O. H. Germ. *stern*, *sternus* (> Mod. Germ. *stern*; Goth. *stairus* < Teuton. *stern*); Lat. *stel* in (for **ste* *culis*) (Gr. *sternē*); by general, immense masses of matter, at a temperature so high as to be self-luminous, scattered through the celestial spaces, and of

the same general nature as the sun. From the standpoint of the nebular hypothesis, each mass is hot because it has never had time to cool since it was first formed from the condensation of the nebula. Like the sun, the stars are surrounded by atmospheres of vapor, cooler than themselves, and spectrum analysis shows that they are composed of chemical elements similar to those found upon the earth.

Number of Stars.—The number of stars which can be seen at one time by the average eye, on a clear evening, may be estimated as between 2,000 and 2,500. As only half the celestial sphere is above the horizon, and few stars can be seen near the horizon, owing to the vapors in the lower part of the atmosphere, the number in the whole celestial sphere is more than double that visible at any one time. The total number in the heavens which the ordinary eye can see may be roughly estimated at 5,000; but these are only a small proportion of the whole number, the great majority being invisible without telescopic aid. It was estimated by Struve that 20,000,000 were visible with Herschel's 20-foot telescope. The more powerful the telescope, the greater the number. No exact estimate has ever been made of the total number visible with the great refractor of the Lick Observatory, but it would probably exceed 50,000,000.

Magnitudes of the Stars.—A glance at the nocturnal sky shows that the stars are of widely different degrees of brightness. A system of estimating the apparent magnitudes or brightness of the stars, which has come down to us from ancient times, is still in use by astronomers. On this system, in its original form, the stars were divided into six different orders of brilliancy. About twenty of the brightest stars in the heavens were called of the first magnitude. Next in order came the brightest stars of the Great Bear and of Cassiopeia. These were called of the second magnitude. The successive magnitudes corresponded with the continually diminishing degree of light, until the sixth was reached, which included the faintest visible with the naked eye. The original division into magnitudes was not founded on any exact photometric scale, but merely on general impressions derived from estimates by means of the eye. In modern times greater exactness has been aimed at. The general system which astronomers have attempted to follow is that the amounts of light represented by increasing magnitudes shall decrease in geometrical progression. Supposing this system to be exactly followed, a star of the second magnitude would be one which emitted two-fifths as much light as one of the first; one of the third magnitude would be two-fifths as bright as one of the second, and so on. Computing this ratio down to the sixth magnitude, we see that it would represent but little more than one-hundredth part of the light of a star of the first magnitude. The same ratio is continued in the star invisible to the naked eye; a star of the eleventh magnitude means one emitting about 1 per cent. as much light as one of the sixth magnitude. This scale of increase, however, is not perfectly exact, owing to the difficulties of making precise photometric comparisons between stars of greatly different magnitudes. The general rule has been that the magnitudes have been determined merely by estimates, and thus the results given by some observers have been systematically different from those given by others. This is especially true in the case of telescopic stars. Even in the case of the stars visible to the naked eye the difference of light is probably greater than that given by the above rule, some magnitudes being, in a general average, three times as bright as those next below them. The most recent investigators have gone far, however, toward removing all these discrepancies by using a uniform light ratio of two and a half for a unit difference of magnitude.

On the ancient system every star was supposed to belong to one of the six orders of magnitude, and no distinction was made between those belonging to the same order; but, as a matter of fact, the stars range over every degree of brilliancy from the first to the sixth, and the classification into magnitudes is arbitrary. How exact soever we might make it, the brightest star of the fifth magnitude would be equal with the faintest star of the fourth, the brightest star of the fourth equal to the faintest star of the third, etc.; hence astronomers have striven to express the magnitudes more exactly by introducing subdivisions. At first each magnitude was divided into three subdivisions: a bright one, a medium, and a faint one. The two extreme subdivisions were designated by writing the number both of that magnitude and the one next to it. For example, the magnitude of an average third-magnitude star was represented by the number 3 simply. A star between the third

and fourth, but nearer to the third, was represented by the number 3.4. The next class in order would be the brightest stars of the fourth magnitude, which were represented by 4.3. Then the average fourth-magnitude stars were represented by 4 simply. Next, the fainter stars of this order, or those which approached the fifth magnitude, were called 4.5. Next came the brighter fifth-magnitude stars, which approached the fourth magnitude, and were called 5.4, etc. This system, though very recently in use, is too clumsy to meet the requirements of exactness in science, and it is now common to consider the magnitudes as regularly variable quantities, and represent them in the usual way by numbers and decimals. Accordingly, in modern photometry units and tenths are used. An average third-magnitude star is represented by 3.0; one fainter by a certain amount is called 3.1; next, 3.2, etc. The progression of 0.1 in each magnitude corresponds to an increase in light of nearly one-tenth; that is to say, a star of magnitude 2.9 is about one-tenth brighter than one of 3.0; one of 2.8 a tenth brighter than one of 2.9, etc. This rate of increase is such that a change of a whole magnitude will correspond to an increase of about two and a half times. Indeed, in the most recent photometries the decimals are carried to hundredths.

This system does not express the amount of light emitted by a star, but rather the negative of its logarithm. It is more convenient, however, than one which would attempt to express the exact amount of light. Photometric estimates are necessarily made by the eye, and do not admit of direct measures. Now a geometrical progression of this sort can be estimated better by the eye than one in which an attempt is made to measure the quantity of light.

The number of stars of each magnitude increases with their minuteness. Roughly speaking, there are three times as many of the second magnitude as of the first; three times as many of the third as of the second, and so on. In the case of the fainter stars, however, the progression is not so rapid. There are between two and three times as many stars of the sixth magnitude as of the fifth; probably about twice as many of the seventh as of the sixth, and so on. An idea of this order may be gained by saying that the absolute amount of light emitted by the entire number of all the stars of any given order of magnitudes is not extravagantly different from the third down to the fainter telescopic stars. For example, each star of the sixth magnitude emits about two-fifths as much light as one of the fifth; but as there are two and a half times as many stars, the greater number nearly compensates for their smaller brilliancy, so that the total amount of light emitted by all of the sixth magnitude is about the same as the total amount emitted by all of the fifth.

Constellations and Names.—In former ages the figures of men, animals, or natural objects were supposed to be delineated on the face of the nocturnal sky, so as to include all the principal stars, and the stars were designated by the particular limb or part of the animal in which they were found. The bright red star, Aldebaran, for example, in the constellation Taurus, formed the eye of the bull, and two other smaller stars were at the ends of his horns. So we have three stars forming the belt of Orion, and three others his sword. In ancient times special names were given to several of the brighter stars; thus Arcturus is alluded to in the book of Job. The Arabs introduced special names for 100 or 200 of the stars. Some of these names are still used, but the tendency in astronomical practice is to drop them and designate the stars according to the system of Bayer. This system, now in vogue for all the more conspicuous stars, was introduced by Bayer about the year 1600. It is analogous to that which is used in distinguishing persons by two names, the surname and the Christian name. All the stars of a constellation have the name of that constellation as a surname. The Christian names are the letters of the Greek alphabet, α , β , etc. These letters are used in each constellation in the same manner that persons of different families may have the same Christian name. The first letters of the alphabet are applied to the brighter stars, but their order as laid down by Bayer on his maps is not exactly that of brilliancy. Thus α Ursa Minoris is one of the two brightest stars in Ursa Minor; β Ursa Minoris is the other; γ Minoris is the third in the order of brilliancy, etc. So α Aquila is the brightest star in the constellation Aquila; β Aquila the next brightest, etc. When the Greek alphabet was exhausted, in the case of any one constellation, the Italic alphabet was used. In modern times several stars are represented by one of Bayer's letters and a number attached to it. Thus

two stars in Aquarius are represented by h_1 and h_2 respectively. Flamsteed, in making his great catalogue of stars, found that he had to include so many stars not lettered by Bayer that he adopted the plan of using numbers, instead of the Greek and Italic letters. These numbers were ar-

by Flamsteed's number. Stars which have neither letter nor number are distinguished simply by their magnitude, right ascension, and declination, or by their number in some well-known catalogue; but for uniformity the constellation to which they belong is frequently indicated.

Distribution of the Stars.—The distribution of the stars in space has been considered by Herschel and other astronomers, but, though some traces of arrangement have been discerned, no distinct law has yet been formulated. (See GALAXY.) In certain parts of the heavens the stars are heaped together in clusters. The telescope reveals wonderful groups, such as that in Hercules, which contains thousands of stars in a small space, spreading at the edge into curved sprays. A group near κ of the Southern Cross shows an aggregation of variously colored stars. In Fig. 1 the central portion of the group in Perseus is exhibited. Figs. 2 and 3, representing clusters in Canes Venatici and Aquarius, give an idea of groups composed of immense numbers of small stars arranged in a globular form.

ranged in the orders of right ascension; thus 1 Scorpii was the first star in Scorpius which passed the meridian, 2 Scorpii

FIG. 2.—Globular cluster in Canes Venatici.

the second, etc. The system commonly used now is to designate the star by Bayer's letter, when it has one, otherwise

FIG. 3.—Globular cluster in Aquarius.

Variable Stars.—It has long been known that certain stars vary in brilliancy from time to time. The two most remarkable ones, which have long been known, are α Ceti and β Persei, or Algol. During the greater part of the time the former of these stars is invisible to the naked eye; but at intervals of about eleven months it increases so as to become plainly visible, and after retaining a maximum brilliancy for some two weeks fades away again. Its maximum brilliancy, however, is very different at different appearances, ranging from the second all the way to the fifth. The law of variation is so irregular as not to admit of any exact statement; even the period of 331 days varies from time to time. Owing to the manner in which it blazes up, it was formerly called *Mira Ceti*. For an account of the variations in the light of Algol, and the discoveries to which they have given rise, see ALGOL.

In the southern hemisphere there is a star, η Argus, which for several centuries past has varied in the most singular manner. The first record of it was by Halley in 1677, when it was classed as of the fourth magnitude. In 1837 Sir John Herschel, while making observations at the Cape of Good Hope, was astonished by the appearance of a new star of the first magnitude, which on referring to a map he found to be η Argus. Its light was, however, nearly trebled, being then greater than that of Rigel. He states that the light continued to increase until the beginning of 1838, when it was brighter than most of the stars of the first magnitude. It then gradually faded away for two or three years, but in 1842 and 1843 blazed up brighter than ever, so as to be the brightest star in the heavens, except Sirius. Since that time it has been steadily diminishing; in 1868 it was no longer visible to the naked eye, and since that time has sunk to about the eighth magnitude.

Why some stars vary while others do not science has not been able to explain, except in a few cases. One of these is Algol, whose variations are due to a partial eclipse by a dark body revolving around it. There are a few other stars whose light slightly fades away at certain intervals, and whose variations are therefore presumed to be due to a similar cause. With most of the variable stars, however, the changes of light go on so continuously as to show that it is due to the constitution of the star itself. It has been suggested that such stars are brighter on one side than on the other, and show different faces as they revolve. This hypothesis is a purely speculative one, not only without proof, but without any great degree of probability. The theory which at present seems to rest upon the best foundation is that the variations are due to a process analogous to that of the formation of spots on the sun. The actual area of the sun covered by spots is so small that the variation of the light thus caused would evade photometric measurement; but it may easily be supposed that this spotted area upon a few of the stars so much exceeds that of the sun, both in variation and amount, as to be sensible to such measurement. The spots on the sun go through a regular period in eleven years. It may therefore be called a variable star, with a period of eleven years. It may therefore be said, with a considerable degree of probability, that variations in brilliancy among the stars are due to the regular formation of spots like those on the sun, at intervals which are sometimes fairly regular, and at other times very irregular, according to the constitution of the star itself.

Colored Stars.—A very slight examination will show to any observer of the heavens that the stars are of different colors. The great majority are what would be called white. A few, however, such as Sirius and Alpha Lyrae, have a slightly bluish tint. Many others, as Aldebaran, Arcturus, Antares, and Alpha Orionis, have a reddish tinge. These differences of color are probably due in part to differences in the temperature of the stars, and in the absorbing power of the atmospheres which surround them. It is familiarly known that the color of the light emitted by a piece of heated iron is at first red, and then it changes toward white as the iron gets hotter. This law is so well established in the case of terrestrial bodies that little doubt is felt that the red stars are not at so high temperature as those of other colors. Another curious fact in connection with this is that variability predominates among the red stars. It is thus rendered likely that the red stars are those in the most advanced stage of cooling, and most subject to the formation of spots. Probably if such a star were brought as near to us as the sun is we should find the spots frequently covering half the disk, or more, and changing from time to time in amount, as the spots on the sun change.

Stellar spectra can be distinguished into four categories or types. The first is that of the white or azure-tinted stars, like Sirius, Lyra, etc., β , γ , δ , ϵ , ζ , η of the Great Bear, etc. The spectra of these are almost continuous, except that they are furrowed by four strong black lines, which are absorption-lines of hydrogen. All four lines can be seen in the most brilliant, as Sirius, Lyra, etc.; in the feeblest only the H β , or the F of the sun, is ordinarily visible; but in general this is broad and dilated, and frequently diffused at the edges, especially in Sirius. This is an indication of a very high temperature, and of great density in the hydrogen atmosphere of the stars of this order. There are also seen traces of other lines, as of magnesium, sodium, and some of iron; but these are extremely feeble, and require for their observation an atmosphere of great purity. Many stars appear of uniform light, without lines, which studied with care are found to belong to this type.

The second type is that of the yellow stars. They have very fine lines, and their spectra are perfectly similar in character to that of the sun. Capella, Pollux, and many others feebly yellow have such a character. The fineness of the lines requires that in these researches the atmosphere should be very clear and quiet. Sodium, hydrogen, and iron are very conspicuous in them. Arcturus and Aldebaran, in their periods of lively yellow light, approach this type, and in the periods of red light the following. It is curious that α Ursæ Majoris is of this type, while all the others of that constellation belong to the first.

The third type is that which is exhibited by the orange and red stars. It is formed of lines and zones or nebulous bands. A specially striking example is α Orionis, the prototype of this class, to which belong also α Scorpionis, α Ceti, β Pegasi, α Herculis, and many other beautiful examples. This spectrum ought to be considered as really composed of two spectra superposed—one formed of broad zones of gradually deepening cloudiness, producing the effect of lights and shadows in a fluted column; the other formed of black absorption-lines of the metals. This, for the structure of the broad zones, has for type α Herculis, where the principal channelings are seven in number, but upon these channelings, in the periods of lively red color, the black lines can be perceived. In some variable red stars, in the period of feebleness, is seen a spectrum of a few lively bright lines, as, for example, in α Ceti. The black reversion-lines of hydrogen are feeble, and sometimes not present at all in these spectra, while the sodium, iron, and magnesium lines are very strong; hydrogen is truly there, but is difficult of detection, because the lines are not perfectly reversed.

The fourth type embraces some curious stars, for the most part red. They have only three bands, coinciding in limits with those of the third type, but having twice the breadth; and they are bright notwithstanding the minuteness of the stars. There are lucid lines in some of them, but in general these are feeble and few. They have the bright and well-defined side of their channelings turned toward the violet, while those of the third type turn it toward the red. They appear to give a spectrum similar to that of carbon as it is seen in the central part of the voltaic arch projected between two carbon points; except that, in the stars, the shading off is in the opposite direction—that is, the maximum light is turned toward the violet, while in the carbon arch it is turned toward the red. Many of these stars exhibit only a few luminous lines, and are without the channeled and cloudy spaces; all such are of a deep red, and among them are found the most beautiful spectra.

TABLE B.—THE MORE REMARKABLE STARS OF THE FOURTH TYPE.

Right ascension.	Declination.	Magnitude.
4h. 36.2m.	+67° 54'	6. Fine.
4 42.8	+25 16	8
4 58.1	+0 59	6
6 26.9	+38 33	6.5. Fine.
7 11.5	-11 45	7.5
9 44.6	-22 22	6.5
10 5.8	-34 35	7
10 20.7	-12 39	6. Fine.
10 44.8	-30 30	6.5
12 38.5	+46 13	6. Very fine.
13 19.3	-11 59	7.5
13 47.3	-41 2	7
19 26.5	+76 17	6.5
20 8.6	-21 45	6
21 25.8	+50 58	9
21 38.6	+37 13	8.5
23 39.2	+2 42	6. Fine.

New Stars.—The view has sometimes been entertained that new stars show themselves in the heavens from time to time and that old ones disappear; but neither of these propositions is correct. There is no well-established case of a known star disappearing from the heavens. The supposed cases were those when an observer had made some mistake in recording the position of a star, so that future observers on looking at the place found it vacant. The direct proof that no really new star ever appears is not so easy. As a matter of fact, stars apparently new do appear in the heavens from time to time. The most extraordinary on record was that of 1752, which was described by Tycho Brahe. For nearly a month it was so bright as to be discernible in full daylight. It then faded away, and at the end of another year gradually became invisible. The position of the star was determined by Tycho as well as his instruments would permit, and there is now found to be a telescopic star near the place. Kepler records a similar star, which appeared in 1604, in the constellation Ophiuchus. In October of that year it was of the first magnitude, and remained visible during 1605. It faded away early in 1606.

The question whether such stars were new might have been considered an open one until the appearance of γ Cygni in May, 1860. It was first seen on the 11th of that month, when it had attained the second magnitude. On the question whether the star was visible before that day the testimony is conflicting. The most important circumstances connected with this star is that it was found to have been already recorded in Argelander's catalogue, being a telescopic star of the ninth magnitude. A few days after it blazed forth in the way just described it began to fade again, and has since diminished to its former state. In 1892 a new star appeared in the constellation Auriga, but it did not rise above the fifth magnitude, and would therefore have passed unnoticed but for the watchful eyes constantly directed at the heavens. No certain explanation can be given of these phenomena. In the case of γ Cygni spectroscopic observation seemed to show that the increase of light was due to glowing hydrogen. The suggestion has been made that the outburst was caused by a collision, perhaps by a planet falling into the star. The explanation is purely hypothetical.

Proper Motions of the Stars.—To the unaided vision the stars seem to preserve the same relative position in the heavens from year to year and from century to century. The earliest maps of the constellations show the same arrangement of the stars as the latest ones, but the refined measurements of modern astronomy show a slow motion in the taking place in at least all the brighter stars. This motion, however, does not follow any exact law that has yet been discovered, except in the extent that there is a preponderance of motions in a certain direction in the heavens which may be described as from the constellation Hercules in the northern hemisphere toward that of β Centauri in the southern. The common and natural explanation of this is that the sun has a proper motion toward the constellation Hercules. The preponderance of motions on which this view rests is, however, only the result of a general average; the actual motions of the individual stars take place in all directions. Clusters of stars frequently have a common motion among themselves. This is especially true of the Pleiades, which are moving southward at the rate of about six seconds in a century. The proper motions of the stars all take place in straight lines, so far as observations have yet shown. If any deviations occur, many centuries will be required to show them. For shooting stars, see METEORS.

Stellar Astronomy.—For a very complete general outline of stellar astronomy, reference may be made to the book of Miss Agnes M. Clerke, *The System of the Stars*. The best accounts of the methods of measuring the magnitudes of the stars, and the results of such work, are found in the *Annals of the Harvard Observatory*, especially vols. xiv. and xlv., and in the *Publications of the Potsdam Observatory*, vol. ix., 1894. For details concerning the spectra of the stars, see Schuster, *Spectroscopic Analysis*, translated by E. B. Frost (Boston, 1894). A catalogue of the variable stars, by Chandler, is found in *Ward's Astronomical Journal*, vol. xlii. Among star maps are Proctor's and Collam's, published in England, and Heale's, in Germany. S. NEWCOMB.

Starstone: a variety of sapphire, the *asterion* of Pliny and the *asturion*, found in Ceylon. It presents, when cut in *cabochon*, or in a hemispherical form, and viewed in a direction perpendicular to the axis, a peculiar reflection of light in the form of a star.

Starvation, or Inanition (*starvation* is deriv. of *stare* < M. Eng. *sterven*, die > O. Eng. *starfon* > O. H. Germ. *starben* > Mod. Germ. *sterben*, die; cf. *Ich. starb*, I died, *Ich. lebe*, I am alive. *Inanition* is from Lat. *inani*, the emptiness, deriv. of *stare* re, to empty, deriv. of *inani*, empty); the condition of tissue-waste, exhausted vitality, and death resulting from prolonged privation of food. A slower starvation occurs when food is scanty and unwholesome, or is persistently deficient in one or more of the several constituents essential to the mixed diet of man. Animals have been fed experimentally on single classes of food—one upon albuminoid matter, another partaking of only farinaceous substances, a third only of the hydrocarbons or fats. Such exclusive diet, of whatever kind, proved disastrous; emaciation, enfeeblement, and death by starvation ensued. The phenomena of starvation, complete and partial, have often been studied and recorded, by the shipwrecked, by persons immured in mines, soldiers deprived of supplies, Arctic explorers, as also in the case of the insane and others practicing voluntary starvation. Prolonged abstinence necessitates bodily waste; hence the reported cases of prolonged subsistence without food, usually women apparently in a state of trance or catalepsy, are not to be accredited; carefully investigated, they invariably prove to be artful deceptions by hysterical or demented persons. Rigid exclusion of food and drink causes death, on an average, in from five to eight days. Water, freely supplied, with exclusion of solid food, may prolong life two or three weeks, exceptionally longer. Water constitutes over half the weight and bulk of the body; it is the solvent for all nutritive matter entering the body, and all excreted products which are to be excreted. Even solid food, so called, is in part water. If desiccated food alone be supplied, with no drink, death will result in a few days. Starvation at the outset produces urgent hunger; this may gradually lessen, be replaced by faintness, loss of appetite, and even loathing of food. The strength fails, the body wastes, the mind becomes unbalanced; in some cases there is delirium, and stupor; in others marked nervous excitement and delirium—phenomena excited by non-excreted effete matter accumulated in the blood. The starving person is liable to intercurrent disease, and the community suffering privation is often visited by epidemics of contagious and infectious diseases, which assume an unusually malignant and fatal type, consequent upon the nervous depression and vitiated blood of the persons attacked. Starving persons, when rescued, should not be supplied too suddenly or freely with food; the overworked digestive apparatus can retain and assimilate but small quantities at a time, an excess exciting irritation and dangerous and fatal diarrhoea. Certain diseased conditions may cause starvation; such are stricture and cancer of the oesophagus and upper orifice of the stomach, gastric ulcer, atrophy of the gastric and intestinal glands, and tubercle of the intestine.

Revised by W. PARKER.

Stassfurt: town and railway junction; in province of Saxony, Prussia; on the Bode; 50 miles S. S. W. of Magdeburg (see map of German Empire, ref. 4-P). It is noted for the immense layer of rock-salt in its vicinity, which was discovered in 1827 at a depth of 826 feet and with a thickness of about 1,000 feet. A shaft was finally opened in 1852 and steam-engines used to operate the mine. The total production in 1887 was 301,965 tons of rock-salt and 1,294,081 tons of other salts. An extensive chemical industry has been built up. Pop. (1890) 19,104.

State [M. Eng. *stat*, from O. Fr. *estat* < Fr. *stat*: Ital. *stato* < Lat. *stare*, a standing, position, condition, status, rank, public condition, the commonwealth]; in its present sense, a body politic; a self-governing community organized under permanent law which has for its aim justice and the security of all. It is the best term for denoting communities on their political side whatever their form of government be. The term *nation* implies common origin and language, and as Cicero spoke of the *Greek nation*, although the Greeks never formed a state, nor even a confederation, embracing all who spoke the Greek tongue; and, on the other hand, the kingdom of the Netherlands, such as it was before the disruption in 1830, consisted of inhabitants speaking three languages—Dutch, Flemish, and French—with various earlier institutions and political connections. This was in no sense a nation, but was a state. So Austria at present is not a nation, but is a state where three nationalities at least—a German, a Hungarian, and a Slavonic, to say nothing of Polish and Roumanian and other subjects—are bound together under the same political institutions.

The political senses which the word state and others from the same source took on were more than one. Thus the estates of the later feudal kingdoms were the three or four groups holding the property and represented in the assemblies called the assemblies of the estates. These were the clergy, nobles, burghers, and, in a few countries, the peasants. In the Dutch republic much later each province held a meeting of its estates, and the general meeting of the provinces was called the States-General, where all were represented. The abstract sense of an organized body politic also came into the word. When the North American colonies called themselves free and independent states this sense was adopted, and this sense remained in the term *United States*, which was attached to the new federal republic for want of a better. The reasoning from this term and from sovereignty as to what the rights of the States and of the Union are under the Constitution, instead of discovering from their attributions and powers what they are, has been a source of much confusion and error. Political science, however, is not responsible for this confusion. It knows of independent and of dependent states, of states formed out of states and of simple states, of states under the most varied and dissimilar forms. From the word state, then, we can argue nothing positively of the attributes of that which is so called. The most that can be said is that a state entirely independent and self-governing in order to carry out the ends of its existence ought to have such and such powers. See also SOVEREIGNTY and INTERNATIONAL LAW.

Revised by T. S. WOOLSEY.

State, Department of: the name of an executive department in the U. S. Government, having charge of the relations of that Government with foreign powers. Its head is the Secretary of State, who ranks as the first of the cabinet officers, and is aided in the administration of his office by an assistant secretary, and second and third assistant secretaries. The Secretary not only is charged, under the direction of the President, with all negotiations relating to foreign affairs, but is the medium of correspondence between the President and the executive of the several States, is custodian of the great seal of the U. S., and publishes the laws and resolutions of Congress, proclamations admitting new States into the Union, and amendments to the constitutions. He is further required to issue annual reports to Congress containing information received from members of the consular and diplomatic service.

Staten Island [named by the Dutch in honor of the States- (Dutch *Staten*) General]: largest island in New York harbor; forming Richmond co., N. Y., with county-seat at Richmond (for location, see map of New York, ref. 8-A). It has an extreme length of about 13 miles, extreme width of 8 miles, and area of 58½ sq. miles, and is bounded on the N. by the Kill von Kull, E. by New York harbor, New York Bay, and the Narrows, S. S. E. by Raritan Bay and the lower bay of New York, and W. by Staten Island Sound. It is connected with New York by steam-ferry to St. George, with Perth Amboy, N. J., by ferry from Tottenville, and with Elizabeth, N. J., by a railway bridge across the Arthur Kill. The island is very hilly, has lines of railway extending from St. George to Tottenville and from South Beach to Erastina, and contains the towns of Castleton, Middletown, Northfield, Southfield, and Westfield, in which are the villages of New Brighton, Edgewater, Linoleumville, Port Richmond, and Tottenville. A mile S. E. of Clifton is Fort Wadsworth with a long line of water-batteries, on the north shore is the Sailors' Snug Harbor, and between St. George and Tompkinsville is a U. S. lighthouse station. The island contains many churches, public and private schools, libraries, newspapers, and manufacturing establishments, has excellent drives, and is a place of residence of many New York business men. Pop. (1880) 38,991; (1890) 51,693 (Castleton, 16,423; Middletown, 10,557; Northfield, 9,811; Southfield, 6,644; Westfield, 8,258).

State Rights: See SOVEREIGNTY.

State's Evidence, or (in Great Britain) **King's or Queen's Evidence:** a phrase popularly used to describe the evidence of an accomplice, generally given under an arrangement made with the officer representing the state (in Great Britain the crown) that the witness so testifying shall not himself be prosecuted for the crime of which he confesses himself to be guilty while he is disclosing the guilt of the party on trial. It is often necessary, in order that the ends of justice may not be defeated, that one of several criminals, whether indicted jointly with the others or indicted sepa-

ately, or perhaps not indicted at all, should be procured or suffered by the prosecution to become a witness for the state and to testify on the trial of his fellows, although his evidence may show himself to be guilty of the same offense or of some other offense. When this is done there is generally a tacit understanding or an express agreement with the prosecuting officer that the person whose disclosures are thus used on behalf of the public shall not be brought to trial and conviction. When and with whom such an arrangement shall be made rests on the sound discretion of the officer who represents the people, or, if suit has already been instituted, of the court, and largely depends upon the exigencies of each particular case. The evidence given under such circumstances is of course very suspicious, and it has even been said that as a matter of law no conviction can be had upon the uncorroborated testimony of an accomplice. The better doctrine, however, is, that this is a rule not of the law, but of practice and of expediency. A jury has the power to convict upon such evidence, and their verdict could not be set aside as illegal. The judge should always instruct the jury that the testimony of an accomplice is to be most carefully scrutinized, and that, unless confirmed in material points by other and reliable evidence, a conviction upon it is inexpedient—that the corroboration should extend not merely to the circumstances of the crime itself, but also to the participation therein by the accused who is on trial. Still, such instructions are rather in the nature of advice than of direction or command, and they may therefore be disregarded.

Revised by F. STURGES ALLEN.

States-General: an assembly composed of representatives of the nation. In France it consisted of representatives of the three orders of the kingdom—the nobility, the clergy, and the third estate, or the *bourgeoisie*. Its origin seems to date back to the time of Charlemagne. The first convocation of which history gives an elaborate and authentic report is that of Blois, 1302, by which Philippe le Bel tried to give a greater weight to the course he had adopted in his quarrel with Pope Boniface VIII. The most memorable convocation was that of 1789, which ushered in the Revolution. (See FRANCE, HISTORY OF.) In Holland the name States-General is applied to the legislative body of the kingdom, there distinguishing that assembly from the merely provincial states. The Dutch States-General is composed of two chambers—the upper, elected by the provincial states, and the lower, chosen by the citizens.

States of the Church: See PAPAL STATES.

Statesville: city; capital of Iredell co., N. C.; on the Southern Railway; 25 miles W. by N. of Salisbury, 45 miles N. of Charlotte (for location, see map of North Carolina, ref. 8-E). It is in a stock-raising, a corundum-mining, and a cotton, tobacco, and grain growing region, and contains a U. S. Government building, 7 churches, academy for boys, several public and private schools, manufactories of cotton and tobacco, a national bank with capital of \$50,000, and 2 weekly newspapers. Pop. (1880) 1,062; (1890) 2,318; (1895) estimated, 3,500.

EDITOR OF "LANDMARK."

Statice: a genus of plants to which the MARSH ROSEMARY (*g. v.*) belongs.

Statics [plur. of *static*, from Gr. *στατικός* (sc. *ῥέζον*, art), the art of weighing, liter., fem. of *στατικός*, causing to stand, skilled in weighing, deriv. of *ἰσθάναι*, cause to stand]: that branch of mechanics which treats of the properties and relations of forces in equilibrium. By equilibrium is meant that the forces are in perfect balance, so that the body upon which they act is in a state of rest. According to the classification presented in some text-books on the subject, and, in fact, usually employed by engineers, the word statics is used in opposition to dynamics, the former being the science of equilibrium or rest, the latter of motion, and both together constituting mechanics. Other books regard statics as a subdivision of dynamics. See DYNAMICS.

In statics, forces are measured by the pressures that they will produce, and for convenience the unit of pressure is a certain effect of the force of gravitation as indicated by a spring-balance (not by a steelyard or scales) acted upon at some assigned place by a definite quantity of matter. Thus the unit may be the pressure called an ounce, a pound, or a kilogramme, as may be agreed upon beforehand. In the discussions of statics it is convenient to represent forces by lines, the lengths of the lines being proportional to the intensities of the forces, their directions parallel to the direc-

sums of the forces, and their ends denoting the points of application of the forces; reasoning upon the properties of the lines then leads to the properties and relations of the forces themselves.

The resultant of two or more forces is a single force which produces the same effect as the several forces acting together. The components of a single force are forces whose united action produces the same effect as the single one. The process of combining forces into a resultant is called composition and that of separating a single force into components is called resolution. These processes are effected by means of the principle of the parallelogram of forces, which is thus stated: If two forces P and Q

acting upon the material point a are represented in intensity and direction by the lines ab and ad , their resultant R will be represented in intensity and direction by the diagonal ac of the parallelogram $abed$ constructed upon the two given sides. Since the relations between the forces P , Q , and R are the same as between the corresponding lines in the parallelogram, the two following equations result:

$$R^2 = P^2 + Q^2 + 2PQ \cos \delta, \text{ and } \cos \phi = \frac{R^2 + Q^2 - P^2}{2RQ}.$$

The first determines the intensity of R when P , Q , and the angle δ are given, and the second determines the direction of R , or the angle ϕ which it makes with the given force Q . These two equations contain five quantities, and hence, if three of them are given, the other two may be found. The two forces P and Q , acting at a given angle δ , may thus be decomposed into their resultant, and the angle force R may be resolved into any two components whose directions are given. If the resultant R act as represented in the figure from a toward c , it will replace the two forces P and Q ; if it be taken as acting from c toward a it will hold them in equilibrium.

Another fundamental law of the greatest importance is the principle of moments. (See MOMENT.) This teaches that if several forces acting upon a body be in equilibrium there will be no tendency to rotation in any direction, while that of the parallelogram of forces teaches that there will be no tendency to a motion of translation in any direction. Text-books on statics, after having established and illustrated these fundamental principles, proceed to the consideration of parallel forces and to the determination of centers of gravity and moments of inertia of bodies, after which the equilibrium of forces acting through the cord, lever, pulley, inclined plane, and screw, of which all machines are compounded, is discussed, both in its simplest theoretical conception, and as modified by the forces of friction and cohesion. The laws of the equilibrium of gases and of liquids (hydrostatics), with their applications to the barometer, pump, and hydrostatic press, are then developed and illustrated. The treatment of these questions in the elementary text-books exhibits, however, only the first principles, and forms merely the introduction to the science, whose complete development in its several departments must be sought for in special and technical treatises. Among these, where experiment lends its aid to theory by determining the necessary constants for the full discussion and application of the laws of friction, elasticity, and tension, may be mentioned the theory of the equilibrium of arches and bridges, the theory of the flexure of elastic bodies, the theory of the strength of materials subject to forces of tension, compression, shearing, or torsion, the theory of the tension of fluids, and the statics of molecules.

The forces which come under consideration in statical investigations are all the forces of nature which can be measured by pressures. As to their origin, they may be forces of gravitation, of molecular attraction and repulsion, of friction, or of muscular strength. If the equilibrium of a system of forces is disturbed, motion ensues, and statics passes into kinetics. The very disturbance of equilibrium, however, calls into action the resistance of inertia, and by the consideration of this resistance as a force the laws of statics become applicable, even though the body be not at rest. For by the principle of d'Alembert (which is nothing more than a particular case of Newton's third law of motion) the resistance of the inertia of a body at any instant of its motion is equal and opposite to the resultant of all the exterior forces acting upon it. Hence, regarding inertia as a force,

all the forces acting upon a moving body at any instant are in equilibrium, and the principles of statics suffice for their discussion. It thus appears that statics is but a special case of kinetics, and that the law of d'Alembert furnishes the means of passing from one to the other.

HISTORY AND LITERATURE.—The first recorded principle of statics is that of the equilibrium of weights on a lever, which is a special case of the principle of moments. This was discovered by Archimedes (B. C. 287-212), as also its application in the determination of the centers of gravity of plane figures; in his writings also appear the first investigations concerning the equilibrium of bodies floating or immersed in liquids. For 1800 years after his time there was no further advance. The next step was made by Stevinus (1548-1633), who represented the intensity and direction of forces by straight lines, deduced the principle of the resolution of forces in rectangular directions, and investigated the equilibrium of a body resting upon an inclined plane. Next followed the principle of the parallelogram of forces, which, partially implied by the methods of Stevinus, was only completely established by the labors of Galileo (1564-1642), Varignon (1654-1722), and Newton (1642-1727). To Varignon is also due the development of the simpler properties of the force and equilibrium polygons. About the same time the statics of fluids began to receive attention, the first true explanation of their equilibrium being due to Torricelli (1608-47), the inventor of the barometer. The application of these principles has since those days occupied the attention of a host of writers, and the science has grown to a vast extent. The new branch of graphic statics may be said to have been entirely developed since 1866, when Culmann's work appeared. For detailed information concerning the early history of the subject, see the section on mechanics in Whewell's *History of the Inductive Sciences* (London, 1847; New York, 1859). SEE COMPOSITION OF FORCES, DYNAMICS, FORCE, GRAPHIC STATICS, HYDROSTATICS, MECHANICS, MOMENT, AND STRESSES. MANSFIELD MERRIMAN.

Stations of the Cross: a series of figures or pictures, usually fourteen in number, representing the various stages of the *Via Dolorum*, or our Lord's Passion on the way to Calvary. They are generally found in every Roman Catholic church. In Roman Catholic countries they are often erected by the wayside, in cemeteries, on prominent sites, etc. J. J. K.

Statistics [plur. of *statistic*, liter., pertaining to a statistic or to matters of state]: in its simplest meaning, a description of any class of facts expressed by means of figures. The credit of having founded a science of statistics is usually given to Prof. Achenwall (1712-72), of the University of Göttingen. According to him the total of *Staatsverhältnisse* (the remarkable things pertaining to the state) makes up the constitution of a state in its broadest sense, and "an account of such constitutions of one or more states is statistics." In the development of statistics since Achenwall there seems to have been two stages, or, as Maurice Block prefers to express it, a twofold tendency. The one confines itself to descriptive statistics, that is to say, to a picture of society or of the state, or of any phase of human activity, drawn in figures, and in this manner reduced to measurements. The chief merit of this phase of statistics lies in the fact that it permits a study of conditions by means of comparison. The other tendency is the development of statistics goes a step further than description, and by submitting any class of facts at different times to systematic observation reduces change itself to numerical measurement, and in this way seeks to prove relationships and to discover laws of growth.

Historical Sketch.—(a) *Statistics as a Branch of Government Service.*—The collection of facts pertaining to a state was undertaken long before scientific statistics were thought of. The book of Numbers is in fact a statistical report. There is record of statistical work in China in 2300 B. C. In Greece and Rome also there was considerable activity in systematic collections of data pertaining to national life. In 594 B. C. a census was taken in Greece for the purpose of levying taxes which divided the people into four classes according to wealth. Athens took a census of population in 399 B. C. The constitution of Servius Tullius, 550 B. C., distinguished six property classes. These are all instances of work which in modern times would be called statistical. Also there is evidence that in the Middle Ages there was national enumeration of population or of property. The work, however, was suggested by some practical necessity.

as, for example, the *Domesday Book* of William I., 1088 A. D., or the *Land Register* of Waldemar II., 1231 A. D. In the fifteenth century evidently there was an unusual interest in systematic investigations into the conditions of the various countries of Europe. A second revival of interest in statistical work took place in the latter part of the eighteenth century, due to the new measures, the new hopes, and the new ideas which came in with the French Revolution. In France the need of definite information was formally recognized, and a commission established to collect data for reforms in administration and finance. This finally led to the establishment of statistical bureaus in France, as also in all other countries which felt the influence of modern political life. The need of statistical investigation is one which increases as the spirit of popular government becomes more intense, or the means of realizing popular government more perfect.

(b) *Statistics as a Branch of Knowledge.*—When statistics was first recognized as an independent study, the claims made for it were very broad and comprehensive. The course of lectures in which Achenwall founded this branch of investigation placed before itself this purpose, "To gain political wisdom by means of a knowledge of the various states." His plan contemplated a comparative study of all modern states under seven distinct heads: Literature, geography, physiography and fertility, the number and character of inhabitants, the rights of the several classes, the organization of the state, and a consideration of the needs of the state. The work of Achenwall exerted a great influence throughout Europe. The name of Süssmilch (1707-67) must also be mentioned, since his work was the first which conclusively proved the existence of a rigid law in the matter of births and deaths. Annuities and life-insurance, which presupposed such a law, existed indeed in the Middle Ages, but they were not regarded as a business which could be conducted on a scientific basis. The view taken by Süssmilch was carried further by the well-known Belgian writer, Quetelet (1796-1874), whose work entitled *Sur l'homme et le développement de ses facultés ou essai de physique sociale* declares that the constant averages in moral statistics are a proof that the actions of mankind are regulated by laws. The field of statistics as it was first defined was curtailed by the rise of independent sciences in the latter part of the eighteenth century. The development of political economy at the hands of Adam Smith took from statistics one phase of its investigation. The development of public and administrative law and of practical life-insurance deprived it of other lines of investigation. Thus the scope of statistics as originally held has been very materially narrowed.

Is there a Science of Statistics?—The phrase "science of statistics" has been loosely used to convey a number of indefinite ideas. Its claim to be a science usually rests on the observation of uniformity in those domains of human activity which are commonly regarded as subject to the control of the individual. For example, one would suppose that suicides, being wholly under the direction of the individual will, would show no rule of recurrence, but a study of the statistics of suicides shows that nothing is more constant in its recurrence than the cause for which, the time in which, and the manner by which suicides are committed. The same is true in any domain of human activity, so much so indeed that by the use of statistics one is able to predict with a very great degree of assurance what is likely to happen. This fact, however, does not seem to make good the claim that statistics may be regarded as an independent science, but indicates rather the possibility of scientific treatment of all social and moral questions. From this point of view statistics comes to be a method of investigation. It is not an independent science, but a branch of the science of logic. Were the existence of a science of statistics admitted, it would necessarily be a science that would include investigations into every department of political, social, and industrial life, since all of these may be studied by the statistical method. Accepting then statistics as a science of method, it may be regarded as consisting in a systematic observation and classification of facts.

Methods of Comparison in Statistics.—The chief use of statistical investigation, in addition to the discovery of laws of constant recurrence, is the discovery of laws of change. It is the peculiar office of statistics to discern the direction of progress and to measure both the actual and the relative strength of the forces which impel it, and this it does by providing the means of accurate comparison between conditions of society and phases of human activity at various

times. This, however, is no light task. The difficulty in carrying it through arises from the fact that the mass of data necessary for accurate description is likely to be so great that the mind can not grasp it. The student who avails himself of statistics as a means of reasoning is, on this account, obliged to reduce the mass of information presented to him in the form of tables of figures to some simple equivalent for the purpose of comparison, or, if the data comprises incongruous factors, they must be reduced to some common denominator. There are several methods by which this may be accomplished, and the trustworthiness of the conclusions arrived at depends in very large measure upon the intelligence with which these methods are followed. Three of these methods may be noted: First, statistics may make use of percentages as a basis of comparison either for the purpose of measuring the relative importance of similar factors, which, taken in the aggregate, comprise a total, or for the purpose of measuring the progress or regress of specific lines of facts during a definite period of time. The chief error to which the use of percentages as a basis of comparison is liable arises from the failure to observe the basal numbers upon which percentages are computed. For example, an increase of 10 miles in railway mileage in a district which had but 10 miles to start with would show a higher percentage of increase than an increase of 1,000 miles in a district which had 10,000 miles of line at the outset. One who reasons by means of percentages must hold constantly in mind that he is dealing with ratios and not with absolute facts. A second method of bringing large masses of facts into usable shape is by means of "index figures." All investigations must of course begin at some definite period of time, and all the facts subjected to observation are arbitrarily reduced to some common basis. The subsequent changes for each line of facts are then set down in their relation to this assumed basis, and the divergence which in this manner is brought to light shows clearly the relative movements. For the purpose of illustration let it be assumed that one desires to investigate the changes in the prices of various commodities. The price of all articles considered will be set down, let us say, as 100; subsequent variations from what may be termed the original price are noted with relation to this figure, and the divergence of quotations from the assumed index figure shows the changes in price of any particular commodity as compared with other commodities. The general movement also in the price of commodities as compared with the index figure indicates the trend of general prices. Thus the index figure serves for the statistician a purpose similar to that which the "bench mark" serves for the civil engineer. Third, the most common basis of comparison is by means of averages. The idea of an average is to obtain a typical unit. A typical unit may be accepted as the representative of the mass of facts from which it is deduced, and as such can be used as a basis of comparison. There is great danger, however, in reasoning upon a basis of averages. This is not because the theory of averages is incorrect, but is due to the difficulty of obtaining an average which is really typical in character. Two rules must be observed in arriving at a true average. In the first place, a sufficiently large number of individual facts must be collected to nullify the influence of any unusual or abnormal cases. In the second place, individual facts should be allowed to influence the average in proportion to their relative importance. For example, wheat is relatively of more vital importance to the people than silks, and any investigation which holds in view the effect of changes in prices upon the wellbeing of a community must lay greater stress on variations in the price of wheat than in that of silks. Again, it will not do in determining the average of wages to rely upon the daily rate of wages reported as paid, but the number of days in the year for which the workmen receive the stated wages must also be taken into account. As in the case of percentages, it is necessary that averages should be used in an intelligent manner, and with a clear appreciation of what they mean and how they are obtained.

Use of Statistics.—The most familiar use made of statistics is to portray existing social conditions and to measure the strength of existing social forces. A statistical inquiry has been aptly termed an instantaneous photograph expressed in figures. They are of immense importance to the statesman in gaining a knowledge of the exact condition of the country, and if several statistical investigations, taken at different times, be subjected to comparative scrutiny and studied in the light of current history, the knowledge thus

valued should guarantee society against pernicious legislation. This is the original idea of statistics, and it is perhaps at present the most significant. The economist and the student of philosophy also derive great assistance from statistical investigations in that they throw light upon the character of nations and the character of individuals, without which no trustworthy conclusions may be arrived at. At present, however, there is another and a more practical use which statistics are in some degree coming to serve. The tendency toward combination of industries and concentration of capital is very marked. The trust and various forms of combinations among corporations seem to have become a permanent form of industrial organization. This tendency has brought society face to face with the monopoly problem, and the question frequently presents itself, How will society be able to control this great aggregation of capital and at the same time maintain the conditions of individual liberty? Without attempting a discussion of this question, it is suggested that the increasingly organic character of society is recognized the more complete will be the reliance placed upon the principle of publicity as a principle of control. Wherever the principle of publicity is realized, however, these statistics must become of relatively more and more importance. The final use of statistics, then, as here suggested, is that they may serve as the medium for realizing the conservative influence which lies in the principle of publicity. The revival of interest in statistics since 1870 can only be explained by a recognition of their great importance from the point of view of administrative control.

Branches of Statistical Inquiry.—There is no limit, so far as theory is concerned, to the possible development of statistical investigation, nor is there any universally accepted classification. The classification here submitted is the one adopted by Haushofer, professor in the School of Technology at Munich, and gives four heads: Population statistics, industrial statistics, statistics of social and political life, and moral statistics. Under population statistics are included all extensive class of facts. Thus in addition to the actual count there is included a classification of population by territorial groups for the purpose of ascertaining the density of population. Changes in population are also included, thus bringing into under all questions of birth-rate and death-rate (see *VITAL STATISTICS*) and immigration. The facts pertaining to the physical life of the people are also included under population statistics, as, for example, expectation of life at various ages (see *LIFE-MATHS*), classification on a basis of age, and other like facts. Under industrial statistics are included all facts pertaining to the production, the exchange, the distribution, and the consumption of wealth, as also to the means or instruments by which the industrial process is carried on. Statistics of wages, capital, railways, money, prices, and the like are all included under the head of industrial statistics. The statistics of social and political life include that large range of facts descriptive of the manner in which people live and of the governments under which they live. Under the head of moral statistics are included all facts which indicate the character and habits of the people. Here are to be found the statistics of education, of religion, of crime, of marriage, of the dependent classes, and others of like character.

Official Statistics in the U. S.—It is not possible to give a complete list of the bureaus of investigation for which the State and Federal governments have made provision in the U. S., but a few of the more important may be mentioned. In the Federal Constitution it is provided that a census shall be taken once in ten years, and many of the States also require that a State census shall be taken at certain intervals. In 1870 the scope of the Federal census was greatly extended until at present it may be regarded as a statistical bureau in the widest sense of that term. (See *CENSUS*.) The Agricultural Department has a bureau of statistics which aims to collect all facts of interest to the growers and consumers of farm products. The Treasury Department, in addition to financial statistics, maintains a bureau of statistics which makes regular reports on the imports and exports of the U. S. The comptroller of the currency makes annual reports upon the condition of banking, and the director of the mint upon coinage and the production of the precious metals. The commissioner of education publishes a yearly report on education in the U. S., showing the number of schools, colleges, and universities in the republic, the number of pupils attending each grade of school, the number of teachers, their compensation, and other similar facts. There is also a department of labor established by Congress

for the purpose of collecting statistics of especial interest to the working classes. The interstate commerce commission also provides for an annual publication of the statistics of railways. In addition to these provisions for the collection and compilation of statistics, Congress frequently authorizes special investigations into special topics. The public documents of the Federal Government are rich in statistical material, while many of the States maintain efficient bureaus for the collection of facts of local interest.

LITERATURE.—The following are some of the important statistical works: *Lehr- und Handbuch der Statistik*, by Dr. Max Haushofer; *Traité Théorique et Pratique de Statistique*, by Maurice Block; *The History, Theory, and Techniques of Statistics*, by August Mehm, translation into English by Roland Falkner; *Die Moralstatistik*, by Alois von Oettingen; *Journal of the London Statistical Society*; publications of the American Statistical Association; *Bulletin de l'Institut International de Statistique*.
HENRY U. ALLAN.

Statins, CUCULIN. See CUCULIN STATIN.

Statius, PUBLIUS PAVINUS, author, is about 45 a. d. in Naples; seems to have acquired early and rapidly a great fame by his victories in the Alban poetical contests, and then to have lost it again as rapidly after his defeat in the quinquennial contest instituted by Domitian, but very little is known of his personal life. He lived at one time in Rome and enjoyed the favor of Domitian, but died about 96 a. d., in retirement at Naples. Juvenal is the only contemporary author who mentions him. For the story that Domitian stabbed him in a fit of anger there is no foundation. Of his works are still extant *Silvæ*, *Libri V.*, a collection of miscellaneous poems; *Thebaidos Libri XII.*, translated into English, the first book by Pope, the first five books by Thomas Stephens (1648), the whole poem by W. L. Lewis (1767); *Achilleidos Libri II.*, unfinished, translated into English by Howard (1656); best editions by Anser and Lonsie (4 vols., Paris, 1825-30); *Thebaidos Libri I.-VI.*, by G. Müller (Leipzig, 1870); *Silvæ*, by Böhrens (Leipzig, 1870); and *Achilleis und Thebais*, by Kohlmann (Leipzig, 1879-80).

Revised by M. WAGNER.

Statoblast: one of the peculiar thick-walled buds occurring in fresh-water sponges and polyzoans, which serve to carry the species over periods of drought or of freezing weather.

Statuary: See SCULPTURE.

Status: a term of the Roman law, borrowed thence by the jurisprudence of continental Europe, denoting the legal condition of a person, or the sum of his capacities and incapacities to hold legal rights or to be subjected to legal duties. The word does not belong to the technical nomenclature of the American and English law, although it is used by some modern text-writers in the same general sense in which it was employed by the Roman jurists. In the Roman law there were three grades of status or legal condition, the lower and more general of which might exist without the others, while the higher and more special always presupposed the lesser. The first and most general was that of liberty (*status libertatis*), by virtue of which a person was either a freeman (*liber*) or a slave (*servus*). The second was that of citizenship (*status civitatis*), by virtue of which a person was either a citizen (*civis*) or a stranger (*peregrinus*). The highest was that of the family (*status familiaris*), by virtue of which a person might be the head of a household (*paterfamilias*) and his own master (*sei juris*), or under the control of another (*alieni juris*), as a son, daughter, wife, ward, and the like. An individual might be a freeman without being a citizen or the head of a household, but he could not be the head of a household without being at the same time a freeman and a citizen. It was possible that a person might lose a higher status, and yet remain in a lower condition; he might cease to be *sei juris*, and still be a citizen; he might forfeit his citizenship, and yet remain free; finally, in the earlier periods of Roman history at least, he might sink from freedom into slavery. Although there is not in U. S. law the technical term *status*, it is plain that to a certain extent the facts denoted by it are present. It is true that at birth a person becomes clothed with the great mass of rights conferred by the law of the U. S., but he may be subjected to certain special capacities or incapacities depending upon the existence of particular circumstances. Among these incapacities are those resulting from infancy, lunacy, marriage in case of the wife, conviction or imprisonment for

crime, public pauperism, and the like. Among the special capacities the most important are those pertaining to citizenship and to the electoral franchise. In the U. S. the differences of legal condition or status belonging to class, rank, profession, or trade have no existence, for every person—at least every sane person—is clothed with the same capacity in respect to these subjects. See **LIBERTY, CITIZEN, and MARRIAGE**. Revised by F. M. BURDICK.

Statute of Frauds: See FRAUDS, STATUTE OF.

Statutes [viâ O. Fr. from Late Lat. *statutum*, liter., something established, neut. perf. partic. of *statuere*, *statutum*, set up, establish, deriv. of *status*, condition, status]: laws in a written form enacted by the supreme legislative authority of a nation or commonwealth, as contradistinguished from laws established by judicial decision. In its generic sense the term includes all legislative as opposed to judicial creations of the law, whatever be the nature and organization of the body—persons or person—which exercises the creative function.

Their Sources.—The sources from which statutes have emanated or may emanate, according to the varying political constitutions of different states, are the general or partial assemblies of the citizens, the emperors, kings, or other single heads of despotic governments, and the representative assemblies, either hereditary or elective. The *leges* and *plebiscita* of the Roman citizens during the republic were produced by the first class of legislators; the "constitutions" of the Roman emperors by the second; while the parliaments of Great Britain and of many other European nations, the U. S. Congress, and the State Legislatures are the modern forms of the third. The extent of the powers held by these bodies is determined by the organic law of each country. The British Parliament is said to be omnipotent; which simply means that the restrictions under which it ordinarily acts are self-imposed. In the U. S. the most remarkable feature of the political organization is the express, positive, and extensive limitation of the legislative function contained in all the written constitutions, which are themselves fundamental statutes adopted by the people in their sovereign capacity. With every new revision of the State constitutions this limitation in reference to the forms and modes of legislation, as well as its subject-matter, is made more far-reaching, minute, and prohibitory.

Their Kinds.—Statutes are variously classified, according to their external form and according to their subject-matter and effects. See **LAW and JURISPRUDENCE**.

Their Parts.—Statutes in Great Britain and the U. S. may, and sometimes do, comprise the following distinct parts: the title, the beginning or enacting clause, the preamble, and the purview. The *title* is a brief preliminary description, e. g. "An act for the amendment of the law." It has become of great importance in the law of the U. S., since most of the State constitutions prescribe in substance that every statute shall contain but one subject, and that this shall be properly expressed in the title. By the *commencement* is meant the formal enacting clause—namely, "Be it enacted by the Senate and House of Representatives of the U. S. of America, in Congress assembled," and "Be it enacted by the queen's most excellent majesty, by and with the advice and consent of the Lords spiritual and temporal and Commons in this present Parliament assembled, and by the authority of the same." The *preamble* is a preface setting forth the reasons and motives for the act. Once very common, it is now generally omitted. The *purview* is the main body, the effective portion of the statute, which contains a statement of the legislative will, and declares its object and purpose. Among the special clauses or subdivisions which may be found in it are the interpretation clause, the saving clause, the repealing clause, the provisos, the exceptions, and the schedules, the objects of which are sufficiently indicated by their names. In codes, whether complete or partial, a more orderly and scientific arrangement of parts is always made, and a division, according to some general plan, into books, titles, chapters, sections, and the like is universal.

When Operative.—The time when statutes take effect is fixed in most of the States of the U. S. either by a constitutional provision or by a general law. In some they become operative at the expiration of a specified number of days after the close of the session, in others at a specified period after the day of their passage; but the Legislature may in the body of a statute prescribe a different time, as, for example, that it shall take effect immediately. The common

law made an act operative from the first day of the session at which it was passed, but this absurd doctrine was abolished in the thirty-third year of George III., and all laws were declared to be binding from the time when they received the royal assent. The repeal of a statute may be either express or by implication. It is express when effected by a clause inserted for that specific purpose in a subsequent act; it is by implication when the provisions of a later enactment are wholly and irreconcilably inconsistent with those contained in an earlier one. Repeal by implication is not favored. If the two statutes concerning the same subject-matter can possibly be harmonized, both will stand; if the contradiction is absolute, the prior one gives way. For a treatment of other topics connected with the general theory of statutes, see **INTERPRETATION, CONSTITUTION, CODE, LAW, and LAW-MAKING, METHODS OF**.

Statutes of Limitation: See LIMITATION OF ACTIONS.

Stäudlin, stoid-leen', KARL FRIEDRICH: author; b. at Stuttgart, July 25, 1761; studied theology at Tübingen 1779-84; traveled in Switzerland, France, and England, and was appointed in 1790 Professor of Theology at Göttingen, where he died July 5, 1826. His numerous writings relate mostly to Church history, such as *Universalgeschichte der christlichen Kirche* (Göttingen, 1806; 5th ed. 1833); *Kirchliche Geographie und Statistik* (2 vols., 1804); *Allgemeine Kirchengeschichte von Grossbritannien* (2 vols., 1819); or to the history of special theological disciplines, such as *Geschichte der Sittenlehre Jesu* (4 vols., 1799-1822); *Geschichte der christlichen Moral seit dem Wiederaufleben der Wissenschaften* (1808); *Geschichte der Moralphilosophie* (1822), etc. His first work, strongly impregnated by the reigning rationalism, was *Geschichte und Geist des Skepticismus* (2 vols., 1794). His autobiography was published by J. T. Hemsen (1826).

Revised by S. M. JACKSON.

Staunton: village; Macoupin co., Ill.; on the Chi., Peoria, and St. L. and the Wabash railways; 14 miles S. S. W. of Litchfield, 36 miles N. E. of St. Louis (for location, see map of Illinois, ref. 8-D). It is in an agricultural and coal-mining region, and contains a private bank and a weekly newspaper. Pop. (1880) 1,358; (1890) 2,209.

Staunton: city (incorporated in 1749); capital of Augusta, co., Va.; on the Balt. and Ohio and the Ches. and Ohio railways; 39 miles W. by N. of Charlottesville, 60 miles N. of Lynchburg (for location, see map of Virginia, ref. 5-F). It is in an agricultural region; has important manufacturing; is the seat of the State Deaf, Dumb, and Blind Institution and of the Western Lunatic Asylum; and is noted for its educational institutions, which include a military academy, 4 seminaries for young ladies, and 2 business colleges. There are 2 national banks with combined capital of \$300,000, a savings-bank, and a daily, a monthly, and 8 weekly newspapers. Pop. (1880) 6,664; (1890) 6,975.

EDITOR OF "NEWS."

Staunton, Sir GEORGE LEONARD: traveler and diplomatist; b. at Cargin, Galway, Ireland, Apr. 19, 1737; educated at Dublin and at Montpellier, France, where he graduated in medicine; returned to England 1760; wrote for London periodicals, acquiring the friendship of Dr. Johnson and other eminent men of letters; settled in 1762 as a physician in the island of Grenada in the West Indies, where he held several official positions, including that of attorney-general, for which he had qualified himself by legal study, and acquired a considerable fortune, which he invested in landed estates; formed in 1774 an intimate friendship with Lord Macartney, the new governor of the island, with whom he was sent prisoner to France on the capture of Grenada in 1779, and whom he accompanied as secretary during his governorship of Madras (1781-84) and his celebrated embassy to China (1792), of which he published in 1797 an interesting narrative. D. in London, Jan. 14, 1801. He was made a baronet 1784 in reward for his success in negotiating a treaty with Tippoo Sahib.—His son, Sir GEORGE THOMAS, b. at Milford, England, May 26, 1781, accompanied his father to China in 1792; learned the Chinese language; held important posts in China in the service of the East India Company; returned to England 1817, and was a member of Parliament, with short intervals, from 1818 to 1852. D. Aug. 10, 1859. He wrote a *Memoir* of his father (1823), an autobiography (1856), and published various works on China.

Staunton, HOWARD: Shakspearean scholar and chess-player; b. in England in 1810; educated at Oxford; settled

in London, was the champion chess-player of his day; edited for many years *The Chess-players' Chronicle* and the chess column of *The Illustrated London News*; published several manuals of the game, including the *Handbook* (1844), *The Companion* (1849), *The Chess Tournament* (1851), and *Chess Praxis* (1869). He published an edition of *Shakespeare's Plays and Poems* in vols., 1857-60, and library ed., 4 vols., 1869, preceded by a *Life*, a photolithographic facsimile of the celebrated "first folio" of 1623 (1866); *Memoirs of Shakespeare, his Will, Indentures of Conveyance, etc.*, photographed (Apr., 1864); also published *The Great Schools of England* (1865; 2d ed., 1869). He was extremely familiar with Elizabethan dramatic literature, and sometimes acted, chiefly in Shakespearean dramas. D. in London, June 25, 1874. Revised by H. A. Berns.

Staunton, William, D. D.: clergyman; b. at Chester, England, Apr. 20, 1803; removed to the U. S. in 1819; was ordained deacon in the Protestant Episcopal Church June 9, 1833, and priest Sept. 7, 1834; rector of churches at Roxbury, Mass., Morristown, N. J., Brooklyn, N. Y., and Potsdam, N. Y. He was the author of *A Dictionary of the Church* (New York, 1840, 1844), republished, much enlarged, as *An Ecclesiastical Dictionary* (New York, 1861); *The Book of Church, Songs, and Prayers for the Family Altar* (1860); *The Book of Common Prayer* (1866); *Voluntaries for the Organ*; and a prize *Te Deum*. D. in New York, Sept. 23, 1889.

Staunton River: a stream of Southern Virginia; rising in the Alleghany Mountains in Montgomery County, flowing N. and S. E. through a pass in the Blue Mountains, and emptying into the Dan at Clarksville, Mecklenburg County, to form the Roanoke. In the first 20 miles of its course it descends 1,000 feet; its entire length is about 900 miles.

Staupitz, now *plis*, *Jomax*; vnc: *medesastie*; descended from a noble family in Meissen, but his parentage and birth-date are unknown; entered the Augustinian order; became prior of its convent in Tübingen 1497, where he took D. D. 1498. Turning entirely from the barren method of the schoolmen, he found in the writings of Augustine and the medieval mystics his spiritual models; took a very active part in the foundation of the University of Wittenberg 1502, and was appointed its first Professor of Theology; became, as vicar-general of the Augustinian order in Germany (1503), acquainted with the young Luther, for whom he conceived a warm friendship, and on whom he exercised considerable influence; procured his appointment as professor in Wittenberg 1508, approved fully of his theses against the sale of indulgences, and gave him, during the first stage of his contest with the Roman Catholic Church, his valuable and effective support. Subsequently, when the controversy became too violent, and an open breach with the Church took place, he retired from Wittenberg 1512, but continued to be vicar-general until 1520. He then went to Salzburg as court-preacher to the archbishop and became abbot of a Benedictine monastery 1522. D. there of apoplexy, Dec. 28, 1534. His friendship for Luther remained unaltered to his death: all the Reformer's writings were found in his library, and his own works, *De Amore Dei* and *De Fide Christiana*, show the spiritual sympathy he felt for the Reformation. Roman Catholic writers have explained the support he gave Luther as an act of jealousy because the sale of indulgences was given to the Dominican, and not to the Augustinian order. A new edition of his works was begun by J. K. P. Knauke (vol. i., *Deutsche Schriften*, Götting, 1867). For his *Biography*, see works by T. Kuhn (Götting, 1870) and L. Keller (Leipzig, 1888).

Revised by S. M. Jargsoy.

Stavang'er: an old town of Norway; at the head of Boksfjorden; about 100 miles S. of Bergen (see map of Norway and Sweden, ref. H-A). It has a cathedral dating from the eleventh century and two harbors. It exports timber and salt herrings. Pop. (1901) 23,030.

Stave, or Staff: in music, the lines and spaces on which the notes are placed. See *NOTATION*.

Stavropol: government of Russia, bordering on the Caspian Sea; area, 23,297 sq. miles. It is mostly low and flat, dotted all over with shallow lakes and covered with extensive swamps. In the southwestern part agriculture is the principal occupation; wheat, millet, wine, and mulberry are cultivated. In the northeastern part the inhabitants are nomads, and immense herds of cattle, horses, and sheep are reared. Pop. (1890) 672,358.

Stavropol: capital of the government of Stavropol, Russia; a fortified town with a trade in cattle, horses, sheep, skins, wool, furs, and honey (see map of Russia, ref. H-A). Its sulphur springs are much frequented. Pop. 35,012.

Stchedrin, *stshed-roon*: pseudonym of MIKHAIL KHRISTIANOVICH SAKHAROV, a satirical writer born in the government of Tver, Russia, Jan. 15, 1826. He entered the Government service in St. Petersburg in 1844, but was removed two years later to Viatka for his two first published stories. Pardoned in 1858, he continued his official career till 1865, after which he devoted himself exclusively to literature. He ranks with the greatest Russian authors of his day, and with the chief satirical ones of all time. In his numerous tales and sketches he touched on every class of society, bringing out with masterly skill their characteristics, at times with brilliant wit, at others with deep pathos, alternately soothing, sad, and amusing, full of originality as well as of the most acute observation. Unfortunately, his works demand an intimate acquaintance with Russian affairs, and, owing to the necessity of escaping the jealousy of the owners, often have to convey their meaning by allusions almost impossible for a foreigner to grasp. Of the many volumes of his works, among the best known are the *Satire a Paris* (satires in prose) and *Nepriyemlye Razgovory* (unpleasant talks, both in 1863); *Dnevnik Prosvetitel'stva* (Diary of a Prosvetitel), *Tashkent'sky* (The People of Tashkent), *Ryuganovskoye Rusko* (Well-known Speeches, 1876), etc. Two or three of his stories have been translated into English; more into French and German. D. in St. Petersburg, May 10, 1890. A. C. C.

Stead, William Thomas: journalist; b. at Middleton, Northumberland, England, July 5, 1849; son of a Congregational minister; became editor of *The Northern Echo*, a halfpenny daily, 1871; assistant editor to John Morley on *The Pall Mall Gazette* Sept., 1880; editor of that paper 1883-90; founded *The Review of Reviews* Jan., 1890. As the editor of *The Pall Mall Gazette* he introduced the system of interviewing and illustrations into the daily newspapers of Great Britain. In July, 1895, he published *The Maiden Tribute of Modern Babylon*. For some of his acts in procuring the evidence on which his statements were based he was imprisoned for three months. The Criminal Law Amendment Act of 1885 was passed in consequence of his exposure. In 1890 he established *Boothland*, a periodical devoted to Spiritualism. He has also published *No Reduction, No Rest, a Plea for the Plan of Campaign*, *Truth about Russia: The Pope and the New Era*, and *If Christ came to Chicago*. C. H. THORNB.

Steam (M. Eng. *stew* < O. Eng. *stōm*, vapor, smoke; Dutch, *stoom*; Fris. *stoams*, steam); aqueous vapor. This substance is of great interest to students of physics and likewise, on account of its application in nearly all thermal engines, to the engineer.

The physical properties of steam, which, like those of other vapors, are less simple than those of a perfect gas, have been exhaustively studied. Some of these properties will be briefly described.

Fluctuations of Boiling-point, Maximum Tension.—Water is converted into steam, at all temperatures, by evaporation. Even below the freezing-point the solid aqueous materials known as ice and snow evaporate slowly unless surrounded by an atmosphere saturated with aqueous vapor.

The process by which steam is obtained for practical purposes, however, is distillation, which begins whenever, at any temperature, the tension of the forming vapor within the mass of the liquid becomes equal to the pressure exerted upon it by the liquid itself and by the superimposed atmosphere above the surface of the latter. Boiling depends then upon a property of steam which enables it to exert pressure, an expansive power which is a function of the temperature. This property, for which the term *tension*, or sometimes *vapor-tension*, is used, has been determined with the utmost exactitude by Regnault. His results are given in Table I., in which the vapor-tension is expressed by means of the height (in centimeters) of the column of pure mercury which the steam is capable of sustaining. This is the quantity given in the second column. It is also expressed in terms of the pressure in grammes which the steam exerts upon a square centimeter of surface (third column of the table).

If the data given in the first two columns of Table I. are plotted with temperatures as abscissas and tensions as ordinates, the result will be a graphical representation of the results obtained by Regnault. This method of presentation

TABLE I.—TENSION OF STEAM AT VARIOUS TEMPERATURES.

offers many advantages over a table, but in order to make it of service in a case like the above it must be plotted to a

FIG. 1.

curve for a vapor is also the boiling-point curve of the liquid for the same vapor. Thus in Fig. 2 abscissas give tempera-

FIG. 2.

very large scale. Fig. 1 shows the general form of the curve between +40° and +230° upon a scale too small to be of service for actual readings.

For many practical purposes one needs to use only a small portion of the entire range of temperatures. If, for example, the change in boiling-point under ordinary barometric fluctuations is desired, the extreme range of ordinates to be considered is from 70 cm. to 80 cm. Fig. 2 is such a boiling-point curve. It follows from the definition of ebullition given in an earlier paragraph that the boiling-point corresponding to a given pressure is simply the temperature at which steam acquires a tension equivalent to the pressure in question. Since tensions, like atmospheric pressures, are measured in centimeters of mercury, the tension-

Closely related to the property of steam just described, and equally important, are its variations of volume when subjected to changes of temperature and pressure. A perfect gas possesses a coefficient of expansion (by constant pressure) of 0.00367, a coefficient constant for the range of pressures and tem-

peratures within which the gas obeys Charles's law. Steam, according to Hirn (*Théorie mécanique de la Chaleur*), possesses a coefficient considerably larger than the above at ordinary temperatures and gradually approaches it as the temperature rises. See Table II.

TABLE II.—COEFFICIENT OF EXPANSION OF STEAM AT CONSTANT PRESSURES.

Range of temperature.	Mean coefficient.
0° to 119°	0.004187
0° to 141°	0.004089
0° to 162°	0.004071
0° to 200°	0.003935
0° to 247°	0.003799

The behavior of a gas or vapor when subjected to simultaneous changes of pressure and temperature can be expressed by means of a surface, the three Cartesian co-ordinates of which are volume (v), pressure (p), and temperature (t). For a perfect gas this surface is hyperbolic, its intersection with any plane parallel to the axes v and p being a rectangular hyperbola (Fig. 3). This hyperbola is an isothermal curve for the gas. The intersection of the surface with planes parallel to the axes v and t forms a series of straight lines, showing the relation between t and v for constant p . The characteristics of vapors, as distinguished from true gases, as has been pointed out in the article PNEUMATICS ($q. v.$), are too great compressibility to satisfy Mariotte's law and too great a change of volume when heated or cooled to satisfy the law of Charles. The result of these peculiarities is to alter the form of surface which exhibits the relation between p , v , and t in such a manner as to cause the isothermal curves to deviate from the hyperbolic form, while at the same time the intersections with planes parallel to the plane t v are no longer straight lines. The existence of such a divergence in the case of steam appears at once from inspection of Table II. The curve marked Vapor in Fig. 3 shows the character of the divergence of the isothermal curve from the hyperbolic form.

FIG. 3.

The conditions under which steam is made and used compel the consideration of its behavior under conditions different from those of an isolated mass of vapor, which loses nothing by condensation and gains nothing from the evaporation of contiguous liquid. Ordinarily we have steam in the presence of unvaporized water, from which it receives or to which it gives up portions of its substance at every change of condition. Steam thus situated is said to be saturated. It is much easier to study the properties of saturated than of unsaturated steam, and its behavior when in that condition is of prime importance.

Energy required for the Production of Steam.—In the conversion of a gramme of water at 0° C. into steam at any given temperature there is a double process: (1) the heating of the liquid up to the boiling-point, and (2) ebullition of the liquid. If the given temperature lies above the boiling-point for the pressure at which the experiment is to be performed—if, that is to say, we are to produce superheated instead of saturated steam—a third process must be added: (3) the heating of the vapor resulting from ebullition from the boiling-point to the required temperature.

To compute the expenditure of energy in these three processes the specific heat of water throughout the range of temperature, from 0° to the boiling-point, the heat of vaporization at the latter temperature, and the specific heat of steam must be known.

The specific heat of water, although taken as a reference unit in calorimetry, was found by Regnault to vary slightly from its value at low temperatures when the investigation was extended over a considerable range. This variation, the existence of which has been abundantly verified by subsequent observers, is of the nature of a very slight increase in the specific heat. Regnault expressed the change by means of the empirical formula,

$$c = 1 + 0.00004t + 0.0000009t^2,$$

in which c is the specific heat and t the temperature. Table III. gives the results of Regnault's determination.

The heat of vaporization of water is likewise a function of the temperature, diminishing as the temperature rises.

TABLE III.—SPECIFIC HEAT OF WATER (AFTER REGNAULT)

and finally disappearing altogether at the "critical temperature" of the liquid.

The heat of vaporization of water between 0° C. and 300° C., and the total heat in lower values necessary to convert a gramme of water at 0° into steam at the required temperature, are given in Table IV. The quantity designated as *total heat* is calculated by means of the equation

$$T = \int_0^t c_p dt + r,$$

where T is the total heat, c_p the specific heat of water, t the range of temperatures through which it is necessary to raise the water to bring it to the boiling-point, and r is the heat of vaporization at the boiling-temperature.

TABLE IV.—HEAT OF VAPORIZATION AND "TOTAL HEAT" OF STEAM.*

Temperature of vaporization, °C.	Heat of vaporization, r , kcal/kg.	Total heat, T , kcal/kg.	Temperature of vaporization, °F.	Heat of vaporization, r , Btu/lb.	Total heat, T , Btu/lb.

* From Zeuner's *Grundriss der mechanischen Wärmetheorie*.

The relations of heat of vaporization and total heat to one another and to the temperature are shown graphically in Fig. 4, in which abscissas are temperatures. The curve marked r represents the heat of vaporization, and that marked T the total heat.

The specific heat of steam is a subject the experimental investigation of which presents great difficulty. The data thus far obtained show, as might be expected, wide divergence. Thus Regnault found the mean specific heat between 100° and 217° C. to be 0.49351, while Gray (*Philosophical Magazine*, 5, xii, 1882) obtained for the lower range of temperatures, 100° - - - 125°, the value 0.3787.

Fortunately a precise knowledge of the specific heat is not of prime importance in most practical cases, since the total amount of heat-energy expended in superheating steam is insignificant when compared with that necessary

in its production. The study of the properties of a vapor like steam are rendered difficult on account of the presence of finely divided water in the unvaporized form of spray, by the admixture of air, and likewise by the fact that any complete investigation involves the use of temperatures difficult to measure with precision, and of pressures hard to deal with experimentally. The engineer, for his part, is embarrassed by the fact that he must use steam sometimes wet and sometimes superheated, and under circumstances such that it is often impossible to know its precise condition. See Regnault, *Qualques Expériences sur la Théorie mécanique de la Chaleur*; Clausius, *Theory of Heat*; Preston on *Heat*; also the chapters on heat, and especially thermodynamics, in the various larger text-books of physics. For the applications of steam in theory and practice, see Rankine's classical work on the steam-engine; Ewing, *Steam and other Heat Engines*; the treatise by Thurston on the same subject, and Carpenter's *Manual of Steam Engineering*. See also LAQUIDS (*Properties of Liquids*), GAS, FLUID, ENCOMPRESS, and STEAM-ENGINE.

E. L. NICHOLS.

Steam-boiler: an apparatus for generating steam by the application of heat. It may be described in general terms as a closed metallic vessel, kept partly filled with water, with arrangements for imparting heat to the water by means of the combustion of fuel. The steam generated is confined in the vessel above the water until it is required for use, when it is drawn off through pipes. This metallic vessel, with its compartments and openings, takes the name of a "boiler" in the shops where it is manufactured; but in many classes or forms of boilers the steam-generating apparatus

additional heating-surface without increased diameter is known as the French or Elephant boiler, shown in Figs. 2

FIG. 1.—Plain cylinder boiler set in brickwork.

and 3. This type has been much used in iron-works practice, where it is desired that a large volume of water serve to

FIGS. 2 and 3.—French boiler. A, ash-pit; F, furnace; W, water-space; S, steam-space; D, steam-dome.

store the heat given off from metallurgical furnaces when there may be considerable variation in the intensity of combustion from time to time.

The next types of externally fired boilers are those containing, in the space devoted to water, flues or tubes through which the hot gases pass on their way to the chimney. The difference between a flue and a tube is that of size merely, a tube larger than 8 inches in diameter being designated as a flue. The flue boiler is shown in Figs. 4 and 5, and the

FIGS. 4 and 5.—Cylinder-flue boiler.

tubular boiler in Fig. 6. The flue boiler is preferred where the fuel has a long flame from the presence of combustible gas, since the fine subdivision of the products of partial combustion in the tubes tends to extinguish the flame before the union with oxygen is complete. On the other hand, where the fuel is anthracite, or where the combustion can be completed before the gases enter the tubes, the extended

FIG. 6.—Cylinder tubular boiler set in brickwork.

heating-surface of the multitubular boiler gives it the preference, provided the quality of the water is consistent with a design of boiler which has parts to which access is so difficult as in the small spaces about the tubes.

The fourth type of externally fired boiler is what is known

as the sectional boiler. It consists essentially of a system of tubes or small units so arranged that a continuous circulation of the water is maintained through the tubes from the mechanical action arising from some portions of the

FIG. 7.—The sectional boiler.

tubes being maintained at a higher temperature than others, the heated and lighter water ascending and the cooler and heavier water descending. The large shell is dispensed with, and the heat applied directly by both radiation and contact to the exterior surfaces of the tubes. The steam-space is usually a large drum or a system of drums with which the various sections of tubes are connected, and there are various devices in practical use for connecting and arranging the tubes, so that they shall form a compact arrangement with all the necessary conditions for applying heat, for accessibility, and for securing circulation and disengagement of steam from the water. Fig. 7 shows a side elevation of one of the early pioneers among boilers of this type in the U. S., but many other forms, and the modern type of the form illustrated, are improvements in many respects upon the original type. The origination of this system is generally ascribed to Jacob Perkins, who in 1831 obtained a patent in England for improvements in generating steam, in which he insisted on the advantages to be gained by causing the water to circulate rapidly over the heating-surfaces exposed to the direct action of the fire. In 1839 Perkins obtained a patent for a more complete apparatus involving this idea, under the title "apparatus for transmitting heat by circulating water." Steam-generators constructed with special reference to this idea had already been tried, however, by John Fitch, John Stevens, and others, 1787-1804; later they were abandoned, owing to practical difficulties in their construction and keeping them in repair.

From the sectional type have been derived the water-tube or coil boilers, in which the heating-surface is made up of a great surface of tubes of small diameter in curved or spiral sections within which the water to be evaporated circulates at high velocity either naturally or by means of a forced circulation. The compactness of such boilers and their availability for high pressures have made them popular for small high-speed marine vessels.

Of the *internally fired* boilers, one representative is the locomotive boiler, in which a rectangular fire-box is surrounded by the water to be evaporated on all sides except the bottom. From the front side of this fire-box the tubes carry the hot gases through the water in the barrel of the boiler to discharge them into the smoke-box at the extreme front.

The flatness of the upper side of the fire-box or crown sheet necessitates an elaborate system of bracing or staying for that exposed surface. The sides or water-legs are prevented from bulging by being tied together by stay-bolts. Fig. 8 shows a typical construction of a locomotive-engine boiler without the extension smoke-box, which is designed to catch and hold the cinders and sparks which the intensely rapid draught of the locomotive-engine boiler carries out of the fire-box in great quantities. Many so-called portable boilers are of the locomotive type.

A modification of the locomotive boiler, much used for portable and stationary engines, is known as the *upright*

FIG. 9.—Locomotive-engine boiler.

boiler, an illustration of which is given in Fig. 9. The simplicity of construction, convenience of access, and small

FIG. 10.—Upright boiler.

space occupied by these boilers, together with their evaporative qualities and strength, render them peculiarly adaptable for some conditions of use.

A form of this boiler which demands special interest and attention is found in the *fire-engine boiler* represented in Fig. 10. This is essentially an upright boiler of the locomotive type, but its peculiarity consists in the great number of tubes and the great extent of heating-surface, compared with the cubic dimensions and the water-space. The tubes are comparatively thin (usually made of brass or copper), thus not only permitting the introduction of a larger number in a given space, but also lessening the

time for the first development of steam. The dimensions of the boiler represented in Fig. 10 are as follows: Total height, 6 ft. 4 in.; outside diameter, 31½ inches; number of brass tubes, 301; diameter of tubes, 1½ inches; length of tubes, 10 inches; distance from center to center of tubes, 1½ inches; heating-surface, 157 sq. feet.

For marine practice, where a boiler thoroughly self-contained is a necessity, the internally fired type has received great development. In the days of early and lighter pressures it was usual to give the boiler a shape which would adapt it to fill the cramped quarters assigned to it in the hull.

Fig. 11 represents varieties of a class of boilers which are known as *return-flue boilers*. They were at one time in very general use in steamboats and steamships in the U. S., and are still employed in some extent for lower pressures. They are characterized by having internal furnaces and internal flues, with no external furnaces or brickwork. The shell in these boilers is made sufficiently large to receive within it the direct flues from the furnace, from front to rear, and also the return flues, the arrangements being as exhibited in the plate. As these boilers have large diameters, it is necessary to strengthen the various parts by stays, as shown in Fig. 12. Around the furnaces the plates are stayed and kept in position by sockets and bolts; the sockets acting as struts and the bolts as stays.

Fig. 12 represents a modification of the return-tubular boiler suited to marine purposes. Such a boiler contains several furnaces, and two or more boilers are usually set together on opposite sides of the hold of the vessel, in such a manner as to have a common chimney. Figs. 13-16 show the more prevalent type of boilers for the recent high pres-

sure requirements of both naval and merchant service. They have received the general name of *Scotch boilers*, while the

FIG. 11.—Return-flue boiler.

type shown in Fig. 12 is usually known as the *Martin boiler*. The cylindrical furnaces shown in Figs. 13-14 are flues

FIG. 12.

corrugated crosswise, so as to secure by this means a greater resistance to the tendency to collapse, which is always pres-

FIG. 13.

FIG. 14.

ent in flues of such large diameter. Where the flue is not corrugated it can be stiffened by means of rings of proper

FIGS. 15 AND 16.—English marine tubular boilers, with cylindrical shells.

dimensions, to which the more flexible furnaces can be attached.

A type of internally fired boiler which has received considerable development in Great Britain is called the *Cornish boiler* (Fig. 17-18); it has the ordinary form of large in-

FIGS. 17 AND 18.—The Cornish boiler.

ternal flue enclosing the fire. The double Cornish boiler has two such flues. The gases pass back through the flue, return to the front at the sides of the boiler, and turn again

to the back underneath. This secures abundant contact between the heating-surface and the gases.

What is commonly known as a Galloway boiler is usually a Cornish boiler across whose flue or flues conical water-tubes are inserted, so that the gases shall impinge against surfaces within which the water is circulating. The Field tubes, often applied to the upright or fire-engine boiler and to other internally fired types, consist of tubes closed at the outer end, and each containing concentrically within it a smaller tube. The heavier water descends in the inner tube, while the lighter hot water and steam ascend in the annular space between the inner and outer tube, thus causing a rapid circulation and a rapid transfer of heat.

Constituent Parts of a Boiler.—There are many appurtenances or parts of a boiler which are common to all the types. Such details, which are represented wholly or in part in nearly all boilers under the same names, are: (1) The *shell*, or external envelope. (2) The *furnace*, the chamber in which combustion takes place. (3) The *flue* or flues, the passages for the heated gases to the chimney. (4) The *bridge*, or rear wall of the furnace, which forms, with the shell of the boiler above it, the boundary of the *draught-area*. (5) The *ash-pit*, the bottom part of the furnace-chamber, which serves as a receptacle for the ashes and cinders, and also as an entrance for air underneath the grate. (6) The *grate*, which is composed of *grate-bars* or *fire-bars*, forming the bottom of the furnace on which the fuel is laid. (7) The *furnace door*. (8) The *ash-pit door*. (9) The *combustion-chamber*. This is an enlargement of the main flue in the rear of the bridge, formed by dropping the bottom of this flue. This part of the main flue is often called the combustion-chamber, under the assumption that the combustion of the volatile portions of the fuel is not completed in the furnace, and that an enlargement of this flue into a sort of chamber favors a more thorough mixing of the air and the volatile or combustible gases, and thus produces complete combustion. This is especially true where air is admitted by a special arrangement behind the bridge or through holes in the furnace door. When bituminous coal, or fuel containing a large quantity of volatile matter, is used, some such arrangement for burning the volatile matters should be made. (10) The *smoke-box* or smoke-connection is more important in the internally fired than in the other classes of boilers. (11) The *steam-dome* is a vertical chamber set upon the upper surface of the shell, and communicating with it freely through holes in the shell or through a single large aperture. Its object is to furnish a chamber in which the steam may be removed as far as possible from the liquid water, and brought to a quiescent state, so that any particles of water which are carried up with it may be separated by precipitation. In some boilers, especially those for marine purposes, this dome takes the form of an annular space, which is traversed by the smoke-stack or chimney, and is then called the *steam-chimney*. (12) *Water-room* and *steam-room*. The interior of the shell of the boiler is divided by the surface of the water into two spaces, called the water-room and steam-room, or water-space and steam-space; all the space occupied by water below the water-level being water-space, and the space or spaces above the water-level, including the steam-dome, being steam-room. The water-room of a plain cylinder boiler occupies about three-fourths of the whole space, and generally in other boilers about three-fourths of the internal capacity of the shell when the water is at its mean level. (13) *Man-holes*, *hand-holes*. It is important in the management of boilers to examine all accessible parts frequently, and accessibility to every part is a fundamental principle of construction, not only for cleaning, but for facilitating repairs. *Man-holes* are apertures left in the shell, and closed by strong plates which can be removed at will, the opening being large enough to admit a man. *Hand-holes* are smaller openings, generally near the bottom, which enable cleaning to be done by means of tools. (14) *Heating-surface*. In all boilers portions of the metal plates which form the shell, flues, or tubes, are exposed on one side to the heat of the furnace, or the heat of the gases in their course to the chimney, and on the other side to the contact of the water or steam, the transfer of heat being from the furnace and flues to the water through these portions of the structure. A heating-surface in a steam-generator may therefore be defined to be any surface which acts as a medium for the transfer of heat from the furnace or gases to the water or steam within the boiler. The efficiency of such a surface depends on the conducting power and on the difference between the

temperatures of the furnace or gases and the water, and the thorough and rapid circulation of the fluids and gases in contact with the surfaces.

Several appurtenances give efficiency and safety to the boiler, viz.: (15) The *feed-apparatus*, composed of a pump, an injector, or other device, with the necessary pipes for supplying water to the boiler. The injector, often called Giffard's injector, from Giffard, who first reduced it to a practical form, is a jet pump in which a jet of steam is changed by rapid condensation to a water jet. The latter, being much smaller and retaining the same velocity, concentrates its pressure on a much smaller area, and by the conversion of its energy into work is enabled to force other water into the boiler. (16) The *safety-valve*, a valve opening outward, and so adjusted and arranged that it will be opened by the internal pressure of the steam when that pressure exceeds a given amount per square inch. (17) The *steam-gauge*, an instrument which exhibits at all times to the eye of the engineman or stoker the pressure of the steam in the boiler. (18) *Water-gauges* and *gaug-cocks*, which are intended to show at any instant the level of the water within the boiler. (19) The *low-water detector*, an instrument attached to many boilers for the purpose of giving an alarm if the water falls below a given point.

Chimneys.—The chimney, in all cases in which the draught is produced by a simple chimney-draught, performs the functions of a machine, and its dimensions (its height and cross-section), taken in connection with the area of the grate and the surface of contact of the fuel exposed to the action of the air, are the principal elements on which not only complete or perfect combustion depends, but also the quantity of fuel burned in a given time. In boilers provided with any other means of draught, such as the steam-jet or the blower, the dimensions of the chimney are not so important. In almost all stationary and in many marine boilers the draught is produced solely by a chimney, which forms an indispensable and important part of the apparatus. The determination of the proper proportions between the heating-surface and the grate-surface depends on the initial temperature of the gases; and as the initial temperature varies with the rate of combustion or the height of the chimney, the height of the chimney indirectly enters into the consideration of this proportion. As is well known, the draught of a chimney is caused by a difference of pressure at the base of the chimney acting in an upward direction, due to the difference between the weight of the heated gases in the chimney and that of a column of the external air of equal height and cross-section.

Heating-surfaces.—The quantity of heat transmitted by any surface depends on the extent of the surface and the difference of temperature between the source of heat and the absorbent; or, in the case of steam-generators, the difference in temperature of the incandescent fuel or heated gases and the water in the boiler. The extent or amount of heating-surface is fixed with reference to the initial temperatures of the furnace and gases; or, since these temperatures are proportional to the rate of combustion, the extent of heating-surface will depend on the rate of combustion to be employed. The extent of heating-surface must evidently also be in proportion to the absolute quantity of fuel burned in a given time; or, what is the same thing, it must have a direct relation to the grate-surface.

Inasmuch as it is impossible to vary the heating-surface at will, after a steam-generator is constructed, it is customary to fix the extent of this surface according to average conditions of use, taking into account average rates of combustion. The following proportions represent as near as can be ascertained the usual rules of practice. The grate-surface being 1, the heating-surfaces are for—

Plain cylinder boilers.....	10 to 15, average 12
Cornish boilers.....	30 to 40, " 35
French cylinder boilers.....	25 to 40, " 33
Cylinder-flue boilers.....	17 to 25, " 21
Cylinder-tubular boilers (chimney-draught).....	25 to 30, " 28
Traction-engine boilers.....	" 32
Marine tubular and flue boilers—French, English, and American practice.....	" 35
Locomotive boilers.....	40 to 100, " 75

The rates of combustion per hour and per square foot of grate, in ordinary practice, are, according to Rankine—

Slowest rate in Cornish boilers.....	4 lb. per hour.
Ordinary rate.....	10 " "
Ordinary rate in factory boilers.....	12 to 16 lb. per hour.
Ordinary rate in marine boilers.....	16 to 24 " "
Locomotive boilers.....	40 to 120 " "

The amount of heating-surface required to evaporate 1 cubic foot of water per hour at 212° is for—

Plain cylindrical boiler.....	8.7 sq. feet.
Horizontal multitubular boiler (water-tube boiler).....	2.5 "
Marine tubular boiler.....	14.5 "
Cylinder fire (water-tube).....	11.7 "

For these the rate of combustion is such that the total heating-surface are sufficient to evaporate 3 lb. of water for 1 lb. of coal.

The following conclusions are deduced from Babcock's experiments. The boilers of various steamships on which experiments were made, with the results, are indicated by the names of the vessels:

Jones Hall.....	Marine tubular.....	19.6	12.0	11.5
St. Vincent.....	".....	18.9	10.5	12.5
Vesley Vess.....	".....	18.0	11.2	12.10
Princess Alice.....	".....	16.2	11.5	8.5
Waverley.....	water-tube.....	20.0	12.4	12.0
Union Pacific.....	fire-tube.....	15.5	11.2	8.0
Yankee.....	marine tubular.....	15.0	12.4	8.5
Shannon.....	marine tubular.....	12.0	11.1	11.5
Average.....				10.6

First column, heating-surface required per one indicated H. P.; second column, number of pounds of water evaporated per hour per pound of combustible; third column, combustible in pounds burned per hour per square foot of grate.

The practice of the Navy Department has been to allow 2 lb. of anthracite coal per hour to evaporate 1 cubic foot of water at 212°, under a pressure of 30 lb. per square inch, which requires two-thirds square foot of grate and 16½ sq. feet of heating-surface.

The quantity of water evaporated per pound of coal for the plain cylinder boiler, the cylinder-fire boiler, and the cylinder-tubular boiler, in the order given, is, under the most favorable circumstances, 7, 8, and 9 lb. of water for each pound of coal burned. The boiler of the railway locomotive is the only one in which the rates of combustion are frequently and greatly varied while in use; and in these boilers it is necessary to provide for very high rates of combustion by giving an extreme amount of heating-surface. The locomotive boiler, with ordinary rates of combustion, corresponds, in evaporative efficiency, to the ordinary marine tubular boiler.

Causes which affect the Efficiency of Evaporation.—These are, 1, those which influence the rate of combustion; and, 2, those which influence the rate of transfer of heat. Among the causes which influence the rate of combustion may be mentioned the temperature of the external air, the temperature of the chimney-pass, the presence of moisture in the air, the management of the fire, the quality of the fuel, and defective combustion. The principal causes which affect the transfer of heat are the rate of combustion, which determines the initial temperatures in the boiler; the temperature of the water in the boiler; the accumulations of incrustations and dust in the tubes; and generally all those circumstances which impair the qualities of the heating-surfaces. The management of the fire and the quality of coal are most important influences on the rate of combustion and economy of fuel.

Supply of Feed-water.—The supply of water to a boiler is of course indispensable to its performance. It is usually accomplished by an independent apparatus, a pump or an injector being employed. The capacity of the feeding apparatus should be such as to supply sufficient water not only for the highest rate of evaporation likely to be attained, but to supply all losses from priming, leakage, blowing off, etc. Care should be taken that the feed-water does not impinge on the plates or flues, as the sudden cooling at one point is liable to fracture the plates. Such fractures can not always be discovered when the boilers are inspected, and are always a source of danger. For land-engines a capacity of two and a half times the net feed-water required by the engine is the rule given by Rankine. Proper arrangements for regulating the supply to the boiler are required. Where steam is used for heating, the condensed steam is returned to the boiler by the action of gravity, the water being supplied from time to time by the attendant.

Feed-water heaters or economizers are devices by which the heat which would otherwise be wasted as rejected from the boiler setting or the engine is utilized to raise the temperature of the feed-water before it enters the boiler. They are therefore known as flue-heaters, when so placed as to avail of waste heat in the chimney flues, and exhaust-steam-heaters when the waste steam from the engine performs this same office. Where the feed-water contains mineral matter

which can be precipitated in the heater, an obvious advantage is secured by keeping this objectionable material out of the generator. Open heaters are those in which the exhaust steam comes into direct contact with the feed-water. In closed heaters either the steam passes through a coil of pipes on the other side of which is the water, or the water is in pipes surrounded by steam.

Boiler-explosions.—The disaster which is known as a boiler-explosion consists of two distinct steps, although one usually succeeds the other instantaneously. (1) There occurs a rupture of the shell or envelope caused by a pressure within the shell greater than it was able to withstand. (2) Through the orifice thus made there is a release of pressure, and the hot water remaining in the boiler forms steam-gas at this reduced pressure with a velocity which is comparable to the rapid formation of gas when a flame is touched to an explosive compound. It can be shown that when the water is under pressure there is stored a force in foot-pounds sufficient if released all at once to produce the phenomena of a most disastrous explosion, so that the study of an explosion is usually mainly concerned with determining the conditions which caused the relative overstrain and the initial rupture. This state of affairs may result because the boiler was too weak for its working pressure by reason of deterioration, old age, defective design, or bad adjustment of the working pressure to its strength. It may also occur because some sudden strain or unequal contraction produced a local superposition of strain which the metal at such weakened place was unable to resist.

Such excessive strains can also follow when, by the sudden opening of a large steam-valve permitting the escape of steam into a cold pipe, there is such a drop of pressure as to cause an shuddering almost concussive in its character, so that the reaction of the weight of water results in such superposition of strains as to cause the first rupture. This explains the frequency of rupture at the moment when steam is turned on and the work-day is about to begin. In the second place, it is surprising in how short a time the pressure within a boiler will increase if there is a constant rate of ordinary evaporation and no outlet for the steam.

The rate of increase of pressure may be found theoretically by means of a formula given by Prof. Zeuner in his work on the *Mechanical Theory of Heat*. Let T be the time, in minutes, which must elapse from the instant that all efflux of steam is prevented in a boiler to the instant when a dangerous or bursting pressure must follow; let W represent the weight of water in the boiler; t , the temperature of the water at a dangerous pressure; t_0 the temperature at the working pressure; Q the quantity of heat, in British units, transferred to the water per minute—then the equation

$$T = \frac{W(t - t_0)}{Q}$$

is approximately correct. This formula shows that the time will be proportional directly to the amount of water in the boiler, to the difference of temperatures t and t_0 , and inversely proportional to the quantity Q . The fluctuations of pressure will be less rapid in boilers which contain large quantities of water and have at the same time a low rate of evaporation. Such conditions are found especially in marine boilers, while the reverse is true for boilers containing small quantities of water and having rapid rates of evaporation, such as locomotive and fire-engine boilers. The fluctuations will also evidently be more rapid at high pressures than at low pressures, since at high pressures a greater change of pressure occurs with an equal difference of temperatures.

Safety-valves.—It is supposed that the gradual increase of pressure above discussed can never take place if the safety-valve is in good working order and if it have proper proportions. Engineers do not, in practice, place their trust in the safety-valve alone, and it is principally to their watchfulness and attention that the public is indebted for safety.

The theoretical area of orifice O for the efflux of a given quantity of steam from a boiler into the atmosphere, supposing this orifice to be a circular area, may be determined by first ascertaining the theoretical velocity of efflux, and multiplying this by a coefficient ascertained by experiments. The experiments made by R. D. Napier on the efflux of steam at different pressures and with different orifices have not only furnished the means of determining the coefficients of efflux, but for determining formulas for the area required for the discharge of a given weight of steam per second. An approximate formula given by Rankine is as follows: When the pressure in the boiler is equal to or greater

than five-thirds the external pressure, then $W = \frac{p_s}{70}$ where W is the number of pounds of steam discharged per square inch of area per second, and p_s is the boiler-pressure in pounds per square inch. Letting W_o represent the pounds of steam per second discharged through the orifice of area O , then $W_o = \frac{p_s}{70} \times O$, and therefore $O = \frac{70 W_o}{p_s}$.

An English empirical rule is that the safety-valve area shall have half a square inch for each square foot of fire-grate, or .025 of a square inch for each square foot of heating-surface. Another, quoted by Rankine, is as follows: Let A be the area of the piston, V its velocity in feet per minute, P the excess of pressure in the boiler above that of the atmosphere in pounds per square inch; then the area will be $\frac{A}{800P}$, nearly. Still another quoted by the same author is: " a = area in square inches = from $\frac{1}{16}$ th to $\frac{1}{8}$ th of the number of pounds of coal burned per hour, or $\frac{1}{8}$ th the area in square inches = $\frac{1}{16}$ th to $\frac{1}{8}$ th of the water evaporated per hour."

In all cases it is not only a matter of observation, but a theoretical law, that as soon as efflux begins there is a considerable diminution of pressure underneath the valve; and numerous devices have been proposed by which the opening of the valve shall not be influenced by the pressure in the orifice, but by the action of the pressure at a point remote from the orifice. Such valves are called pop-valves.

There are supposed to be, in some circumstances, sudden evolutions of steam in such quantities that no relief is possible through safety-valves. In regard to such cases, it can easily be shown that by reason of the high specific heat of water, as compared with iron, it is very difficult for any large quantity of steam to be made even from overheated plates, so that the disasters perhaps rightly attributed to low water are the result, not of excessive internal pressure, but of the strain from contraction when such overheated plates are suddenly cooled by contact with water.

The term "horse-power" of boilers is often used as a measure of the work which a steam-generator can do. Such use is liable to misunderstanding, inasmuch as it implies a rate of work, and a boiler ordinarily does no work, but merely supplies to a machine the means for doing it. The term has, however, acquired a conventional significance among engineers. It has been agreed that the commercial horse-power of a boiler shall be an evaporation of 30 lb. of water per hour from a feed-water temperature of 100° F. into steam at 70 lb. gauge-pressure. This is equivalent to 34½ lb. of water evaporated from a feed-water temperature of 212° F. into steam at the same temperature, which corresponds to 33,305 thermal units per hour. A boiler rated upon the above standard of evaporative capacity should be capable of developing that power with easy firing, moderate draught, and ordinary fuel, while exhibiting good economy; and should be capable of being driven to develop at least one-third more than its rated power to meet emergencies when maximum economy is not the most important object to be attained.

F. R. HUTTON.

Steam-engine: a device or apparatus for converting into work-units the energy of heat, using the expansive force of the vapor of water as a medium. The steam-engine consists therefore necessarily of two parts—the engine proper, in which the expansive force is expended, and the generator, or boiler, in which the energy of a burning fuel is transferred to the water. (See STEAM-BOILER.) Essentially the same mechanism as is required by the steam-engine can be used with ammonia, ether, bisulphide of carbon, etc., as a vehicle for the heat. Water has the great advantage of being cheap, everywhere accessible, without odor, and with a vapor which is not combustible. It has further the great advantage that by reason of its low specific heat a given volume of the vapor of water will carry more heat than the same volume of any other medium at the same pressure.

The earliest notice of the use of steam as a motive power is in the *Pneumatica* of HERO (q. v.). After many trivial machines by various inventors, the first really useful steam-engine was made by Edward Somerset, second Marquis of Worcester, and described in his *Century of Inventions* (1663). It was designed to raise water. Thomas Savery improved this, and received a patent in 1698; his engine was the first to come into extensive use. Both these engines applied the expansive force of steam directly to the column of water; Savery's then condensed the steam, and by means of valves made use also of the atmospheric pressure. The invention of the piston is due to Denis Papin (1647–1712), but the first practical cylinder-and-piston steam-engine was made by Newcomen (see NEWCOMEN, THOMAS). JAMES WATT (q. v.) improved this engine by providing a separate vessel to serve as condenser and by making the engine double-acting. The first automatic valve-gear (1713) was the device of a boy named Humphrey Potter; this was improved in 1718 by Henry Beighton. For the invention and description of locomotive engines, see RAILWAYS and LOCOMOTIVE.

The unit for measuring the performance of steam-engines is the "horse-power," which was determined first by James Watt. The horse-power consists of 33,000 foot-pounds moved in one minute, and is a standard unit wherever the English foot and pound prevail. The horse-power in countries which employ the metric system is slightly less (32,549 foot-pounds). The performance of steam-engines is measured either on the revolving shaft of the engine by a measuring apparatus or dynamometer, or it is determined by the effort of the expansive force of the steam, measured in pounds of pressure exerted upon a known area in the cylinder of the engine, which product when multiplied by feet of distance, through which that pressure is exerted, will give a final product in foot-pounds, and measure the performance. That is: If P = the mean effective pressure per square inch of area in the organ receiving the expansive force of the steam, and A = the area, in square inches, of a disk, or piston, fitting steam-tight in a cylinder, then $P \times A$ = a total number of pounds. Furthermore, if L = the length of the traverse of the above movable piston expressed in feet, then $P \times A \times L$ will denote the foot-pounds in one traverse of the piston in the cylinder. If the piston makes a number, N , of traverses in a minute, the product $PALN$ will give the foot-pounds of performance per minute; N will usually be equal to twice the number of revolutions per minute. Finally, the horse-power of a steam-engine will be $PALN \div 33,000$.

It will appear from the above that two great types of engine can be designed of equal capacity in horse-power. The product LN is called piston-speed of an engine, and with a constant value for this product the length of the stroke may be long, and the number of strokes per minute small, or a greater number of strokes per minute may be made with a short length for each stroke. It is further clear that by making the product LN large we can correspondingly diminish the factor A , and by making N large both the diameter and length of the engine will be diminished. When both high rotative speed and high piston-speed are combined the engine becomes compact, is easily regulated, and is light. Such an engine, however, is not ordinarily so economical in the use of steam as a more moderate application of these principles permits, by reason of the large clearance volumes in the cylinder, and by the necessity of a copious lubrication.

The usual engine-cylinder has a circular piston traversing a cylinder whose length varies from the diameter of the piston up to twice its diameter. Steam is admitted alternately on each side of this circular disk or piston, and causes it to move first in one direction and then in the other. This most common form of a cylinder is shown in Fig. 1, which represents a longitudinal section of a cylinder, with its piston and piston-rod. Fig. 2 represents a section of the cylinder of the Corliss engine. It shows a differ-

FIG. 1.

FIG. 2.

ent arrangement of openings for the entrance and exhaust of steam. Fig. 2 represents the piston with its packing-

flange. These flange serve to prevent the escape of steam past the piston. The motion which has done its work of driving the piston in one direction is permitted to escape from the cylinder, and is called exhaust steam. The motion of the piston is carried outside by a piston-rod through

Fig. 2—Horizontal stationary engine.

a device in the head of the cylinder so constructed as to permit the rod to slide in and out steam-tight. This apparatus is called a stuffing-box, and is arranged so that a fibrous and elastic material is forced against the rod by being compressed by a gland in an annular cavity. The end of the piston-rod which protrudes from the stuffing-box is guided by a cross-head which compels it to move in the axis of the cylinder by sliding between guides. In certain engines this oscillating movement of the cross-head is secured by a linkage without the use of guides. Such linkage is called a parallel motion. The cross-head carries a pin called the cross-head pin on which vibrates the connecting-rod, by which the motion of the cross-head in a straight line is converted into the continuous rotation of the crank, by whose means the main shaft of the engine is caused to rotate continuously in one direction by the alternating traverse or reciprocation of the piston in the cylinder. The type above described is much the most widely extended, and is considered the most efficient and economical.

Fig. 3 exhibits the mechanism of such a stationary steam-engine, by which the reciprocating rectilinear motion of the piston and piston-rod is converted into continuous rotary motion. In this illustration C represents the cylinder, C' the cross-head moving in guides, C'' the crank, C''' the connecting-rod, F the fly or band-wheel, S the steam-pipe. Fig. 4 represents generally the corresponding features of the Corliss engine.

Fig. 4—The Corliss steam-engine.

Attempts have been made to apply the expansive effort of the steam directly to produce rotation of the crank so as to get rid of the reciprocating motion and the weight of mechanism required for conversion of reciprocating into rotary motion. While the rotary engines offer considerable advantages from their compactness, the direct application of

Fig. 5.

power, the ease with which they are reversed, etc., they are not usually an economical type in consumption of steam by reason of leakage and the difficulty of using steam expansively.

Figs. 5 and 6 are sketches illustrating the rotary forms of engine as invented by Watt and Bramah respectively. In these engines the cylinders are truly cylindrical, but the pistons

revolve about the axes of the cylinders. Of many hundreds of devices of rotary engines these are the principal types. If the connecting-rod of a reciprocating engine be thrown out from its mechanism and the free end of the piston-rod attached to the crank, then the piston-rod must have an angular motion to provide for the play of the crank, and this compels the cylinder to have a motion of oscillation. The engine is then called an oscillating engine, the cylinder being mounted upon transoms on which it oscillates, the transoms being hinged so that steam may enter through one of them and be discharged to the other. While some large engines have been built of this design, the difficulties from leakage when wear has begun are objectionable to this type. The trunk-engine is a mechanism in which the connecting-rod is attached directly to the piston which slides in the cylinder in a straight line. To enable the angular motion of the connecting-

Fig. 6.

rod to pass out of the cylinder steam-tight, it is arranged to swing within a hollow cylinder or trunk whose diameter permits this angular motion without striking the sides and which passes out of the cylinder through a stuffing-box. As this arrangement makes the piston offer only an angular area to the steam on the trunk side, the trunk is often duplicated on the side opposite the crank to equalize the effort on the two strokes. Many illustrations of these trunk-engines are presented by the compact designs of monitors and other small naval vessels. A third type of engine results when the connecting-rod from the cross-head is brought backward at the side of the cylinder or part way to it to a crank at its back head or between the cylinder and cross-head. This type of engine is called a back-crank engine.

Engines may be grouped, according to the direction of the axis of the cylinder, as horizontal, upright, and inclined. The horizontal engine is much the most common because of the easy accessibility of all its parts, the ease with which its foundation can be made, and because all its parts lie close to the foundation. The vertical or upright engine has the advantage of having the piston bear equally over the entire bore of the cylinder without a tendency for the weight of the piston to wear the cylinder out of round. On the other hand, the weight of the reciprocating parts would make the effort on the up and down strokes unequal unless care be taken by special arrangements to neutralize this inequality. The upright engine appears in two forms: with the cylinder above the shaft, known as the inverted vertical, and with the cylinder below the shaft, which may be called the direct vertical. The inverted vertical is much the most usual because the revolving parts are close to the foundation, and the parts which are remote from it are those which have no motion. This is the prevalent type for the marine engine of screw-vessels where the revolving shaft must necessarily be close to the keel (Fig. 10). The direct vertical engine is not much used in the U. S.

In beam-engines a vibrating beam is introduced between the reciprocating piston and the revolving shaft. As distinguished from these, other engines are called direct-acting. In its most usual form the beam-engine is arranged to have a vertical cylinder from the top of which the piston-rod protrudes. The cross-head is connected by the short connecting-rod to one end of the oscillating beam, which is supported usually at its middle point upon a massive bearing. At the other end of the beam a long connecting-rod passes to the crank-pin, so that the alternating motion of the piston is converted by this means into the rotary motion of the shaft. By reason of the fact that in early engines of the beam type the long connecting-rod from the outer end of the beam was attached to the pump-rod of a mine or pit, this long rod in beam-engines is often called the pitman. Fig. 7 shows the mechanism of the American beam-engine as designed for large steamships and river-boats. In this sketch C represents the cylinder, C' the condenser, B the working- (or "walking") beam, C'' the connecting-rod, C''' the crank, A the air-pump, V valve-gearing. The beam-engine as used for pumping gives great convenience of attachment for the rods of the pumping-barrels, and its flexibility in a vertical plane has made it a very favored design for side-wheel vessels, particularly where the condition of shallow water prevented the attainment of vertical stiffness.

in the hull. Triangular beams have been used to enable a horizontal steam-cylinder to operate vertical pumps at a considerable distance below the level of the engine-room. The beam-engine also is convenient where more than one

FIG. 7.

cylinder is to be used to produce motion upon one crank-pin. The *side-lever engine* is one in which the beam is placed below or at the side of the cylinder so as to bring the center of gravity low down in the hull of a side-wheel steamer and below a protective deck.

All reciprocating steam-engines may be classified according to the way in which the steam is employed in their cylinders. The steam may be permitted to flow from the boiler into the cylinder throughout the full length of the stroke of the piston. It must then escape as exhaust from the cylinder at the full pressure at which it entered and carrying with it all the heat which corresponds to that pressure. Such an engine is said to take steam at full stroke and to work without expansion in the cylinder or without cut-off. A second class of engine allows the steam to flow from the boiler into the cylinder at full boiler pressure for but a part of the stroke only. The admission of steam is then cut off by the proper valve mechanism, and the steam inclosed in the cylinder expands in the increase in volume as the piston moves under its action toward the end of its stroke. This increase in volume is accompanied by a fall in pressure and a reduction in temperature, so that upon exhaust a less weight of steam and a less number of units of heat are rejected from the cylinder than in the first case. Such an engine is called an *expansive-working engine* or a *cut-off engine*. The degree of expansion is the reciprocal of the point of cut-off expressed in terms of the length of the piston-stroke.

Again, the steam may be rejected from the cylinder at the pressure of the atmosphere, escaping as the vapor of water at 212° F., or slightly over. Such an engine is called a *non-condensing-engine*, because although the steam rejected passes back to water in the atmosphere at large, it is not condensed to water in connection with the engine itself. In the other type the steam is exhausted from the cylinder into a vessel, where it comes immediately into contact with a cool medium, and is thereby reduced back to warm water with the very great reduction of volume which follows such condensation, so that if the condensed water is continuously removed from the condenser a more or less complete vacuum can be maintained therein. Such an engine is called a *condensing-engine*, and has the advantage over the non-condensing-engine of a greater mean pressure in the cylinder for a given boiler-pressure and point of cut-off, from which results a smaller engine for a given power, or more power from an engine of given proportions. The heat in the steam is also utilized more completely, as the hot water which is caught in the condenser is pumped back again to the boiler at a higher temperature than the feed-water would otherwise have. An air-pump is used for draining the condensed water from the condenser. This, in many types of condensing-engine, is operated from the beam or cross-head of the main cylinder (Fig. 7). In recent practice it has been preferred to operate the air-pump independently with its own steam-cylinder. It can then be run at higher speed than the main

engine, the vacuum in the condenser can be created before the main engine is started, and the air-pump can be located where it may be found most convenient. The advantage of the attached air-pump is that the large engine-cylinder is usually more economical than the small detached one. By putting the condenser at a height over 32 feet in the air, with a pipe running down into a reservoir or well, in which it is at all times sealed, it will be apparent that gravity acting upon the water in the condenser and its descending pipe will compel the water to stand in the pipe at a height at which the barometric pressure of the atmosphere will just balance the column. In other words, a Torricellian vacuum prevails in the condenser. By causing the water to meet the exhaust steam at this height condensation is continuous, and all that is necessary is to provide by the principle of induced currents or otherwise for the removal of air which will enter the condenser by leakage and from the steam and water. Such condensers are called *gravity-condensers*. Two great types of condensers are used. In the first the steam meets the condensing water directly and cools it by contact; the cold water or injection enters the condenser in a jet by atmospheric pressure, which gives to this type of condenser

FIG. 8.

the name of *jet-condenser*. In the other type the steam is condensed by contact with a surface of brass tubes which are kept cold by the circulation through them of the condensing water (Fig. 8). The condensing water enters the tubes at one end, as shown by the arrows, and is discharged at the other, while the steam is admitted around the tubes. A mode of packing the ends of the tubes by ferrules of compressed pine wood is shown in Fig. 9. This device, the invention of Horatio Allen, and others like it have contributed to render the surface-condenser more perfect in its operations. In the jet-condenser a less quantity of water is required and the air-pump handles it all. The steam and condensing water are intimately mixed. In the surface-condenser arrangement the condensed steam is pure distilled water and does not become mixed with the condensing water, which can be impure and unsuitable for use in the boilers. The air-pump handles only the water condensed from the steam, and special pumps, called *circulating-pumps*, are required to circulate the cooling water around the tubes. In sea-going vessels surface-condensation is almost universal, the salt water from outside of the hull being circulated through the condenser and overboard, while the pure distilled water from the air-pumps is used over and over again in the boiler.

FIG. 9.

Another difference which can serve as a basis for classification of steam-engines is brought about by the way in which the alternating traverse of the piston is affected by the pressure of steam. If both strokes forward and back, or upward and downward, of the piston are produced by the pressure of steam upon its area, the engine is said to be *double-acting*. Where steam drives in one direction only the engine is called *single-acting*. By far the greatest number of engines are double-acting. What is called the *Cornish engine* is one of the best known of the single-acting engines. In this design, which is mainly used, and is at its best, for pumping, the steam enters the cylinder from the boiler, and by its direct pressure and after cut-off by its expansion the piston is driven in one direction. When this stroke is completed a valve is opened by which an equilibrium of pressure is established through a side pipe between the top and bottom of the cylinder around the piston. The piston then yields to the action of gravity and returns to its initial position without the use of fresh steam, so that one stroke forward and back is accomplished by a single admission of steam. The Cornish engine appears in two forms: In the first, the piston is connected to the massive

piston-rods of a mine-shaft, or to the heavy plungers of a water-work pumping-engine, by means of a beam, so that the working stroke which lifts the weight of the rods or plungers is the down-stroke of the piston, and the piston-rod passes out of the top of the cylinder. In the second type, which is known as the *Hull Cornish engine*, the piston-rod is attached directly to the rods or plungers, over which the cylinder is placed, so that the piston-rod goes down to the lower head, and the working stroke is the upward traverse of the piston. The Cornish engine has an fly-wheel, and the rapidity of its stroke is controlled by the flow of steam or of water through the valves. It is this peculiarity, which permits the use of a long column of moving water to be the controlling feature of the velocity of the piston, that made this type of pump a popular form in early days. The objections to the system are the great bulk of the cylinder with comparatively small power, the massive foundations required, and the danger from accident to the engine if the pump-barrel should fail to fill, whereby the engine would make an over-stroke, since there is no crank to regulate the length of the stroke. The Cornish engine is usually designed to have its steam-valve operated by a catamaran. The catamaran consists of a small cylinder fitted with a plunger. The pump-rod at their working stroke lift the plunger in the catamaran-cylinder, and the latter is filled with water. A weight upon the catamaran-plunger tends to make it descend, but the speed of its descent is controlled by a valve upon an outlet-pipe whose position, by impeding the outflow of water, controls the time in which the cylinder will empty. The descent of the plunger, when near the bottom, opens the admission-valve of the main engine, and thus causes a stroke to be made. The plunger of the catamaran-cylinder being moving independent of the main engine will cause the latter to make strokes intermitting with periods of rest. For relative types of engines two single-acting cylinders can be attached to the shaft with cranks at opposite phases, the two producing the same effect as a double-acting engine, with the gain that the pressure is always in one direction, and there should be no lost motion.

Another great principle of classification of engines is determined by the fact that the expansion of the steam in the cylinder may take place in a single cylinder, or be made continuous in two or more cylinders. This difference divides engines into simple, compound, and multiple expansion. In the simple engine the steam does its work upon one stroke of the engine, and then escapes as exhaust either into the atmosphere (non-condensing) or into a condenser, where it is released to water and causes a vacuum (condensing). A simple engine may have more than one cylinder, but if each cylinder takes steam direct from the boiler, and that steam is rejected at exhaust without doing additional work in another cylinder, such engine is not a compound engine. In the compound engine the steam enters a cylinder of a certain volume from the boiler and works in it as in a simple engine. The exhaust steam from this cylinder passes into a second cylinder of larger volume (usually three or four times that of the first), where it acts as a driving pressure, and from which it is exhausted when the stroke is completed. It will appear, therefore, that the driving steam for the second cylinder is a back-pressure on the exhaust side of the first cylinder, but as the areas are different the net effect is positive to produce motion of the larger cylinder. If the first cylinder has no cut-off, but takes steam full stroke from the boiler and without expansion, it is obvious that the final volume of the steam is as many times greater than its initial volume as the capacity of the larger cylinder is greater than the smaller, so that an expansive working of the steam is secured, although the first cylinder has a constant propelling effort from the beginning to the end. In a simple engine this expansive effect could be produced only by cutting off admission early in the stroke, whereby the propelling effort would have to be in excess at the beginning of the stroke in order that, at the end, when the pressure had fallen, there might still be sufficient propelling effort to overcome a constant resistance. The compound engine, moreover, by distributing the range of temperature between the initial and final pressures of the steam, when the number of expansions is considerable, in more than one cylinder, causes a diminished loss of heat, both by radiation and conduction of the walls of the cylinder with the steam. The transfer of heat by both these processes is greatest and most rapid when the difference of temperature is greatest. By keeping this difference of temperature low or having it distributed in two cylinders, the total loss is

less than it would have been in the larger cylinder if the latter had been used alone in a single engine. The principle of the compound engine was first proposed by Jonathan Houlden for the single-acting engine in 1781. It was reintroduced by Arthur Woolf for the double-acting engine in 1804. It was applied to some considerable extent, to beam-engines by McNaught about 1845, but really secured its modern development by the application of the principle to marine practice by John Elder, of Glasgow, in 1854.

When the expansion is made continuous, as in the compound engine, through three cylinders, the engine is called *triple expansion* (or *tri-compound*); when the expansion is continuous in four cylinders the engine is called a *quadruple expansion*, or the general name of multiple expansion is given to an engine having the expansion continuous in more than two cylinders. It is the continuity of expansion and not merely the number of cylinders which gives the engine its name. It is often inconvenient in engines of great power to construct a single large cylinder of volume sufficient to secure a sufficient increase of volume to attain the desired range of pressures and the ultimate low temperature. It is usual to call the cylinder which receives the steam directly from the boiler the high-pressure cylinder; the last one in the series, from which the exhaust steam escapes, is called the low-pressure cylinder; if the expansion is continuous in three cylinders the middle one between the high and low pressure cylinders is called the intermediate cylinder. If the steam passes through four cylinders continuously there will be two intermediate cylinders, called respectively the high-pressure intermediate and the low-pressure intermediate. In a multiple-cylinder engine, in which the steam expands from one cylinder into two others, and again such as the same pressure, such two cylinders of equal pressure are designated as the first and second intermediate, or the first and second low-pressure, as the case may be. When two pistons of unequal diameter working with steam of continuous expansion, are arranged upon the same piston-rod, the engine is called a *triple-engine*; when the small cylinder is vertically over the larger in an inverted vertical engine, the name *triple-engine* has been given to it. The cranks of a two-cylinder compound engine (sometimes called a bi-compound) can be arranged so as to be parallel to each other, so as to be 180 degrees apart, or so as to be 90 degrees apart. In the first two arrangements the steam can pass directly from one end of the smaller cylinder in the same or opposite end of the larger; in the third case, when the cranks are quartering, a receiver must be provided into which the steam from the high-pressure cylinder shall pass while the low-pressure piston at its dead point at the end of its cylinder offers no volume to receive the steam discharged from the preceding one. Such engines are therefore called *receiver-compound engines*, and when arranged, as they usually are in stationary practice, so that their two cranks are on opposite ends of the driving-shaft, compelling the steam to cross over a short passage between the cylinders, the engine is called a *cross-compound engine*. This receiver type and the cross-compound form offer the advantages possible from introducing into the receiver a device called a re-heater, reheating or regenerating the steam in its passage from one cylinder to the other. The advantages of economy and from securing ability to use high pressures for the entering steam have been the great reasons for the wide increase in the development of the multiple-expansion engine, both condensing and non-condensing.

A classification of the steam-engine finally, with respect to the uses to which its developed power is to be applied, would be almost an enumeration of all the foregoing types in their different forms. A rough classification might be first into engines for propulsion and engines for stationary uses. The engines for propulsion, on land are the locomotive and the traction engine, and on the water the type of marine engine of transatlantic and naval practice, and the type of beam-engine used more for coastwise traffic and in shallow waters where the paddle-wheel is the means of propulsion.

The locomotive and the traction engine consist of an internally fired boiler (see *STEAM-BOILER*) supported upon wheels, and carried by a frame in which the effect of the cylinders through the wheels gives the desired motion. The wheels receiving the effect of the steam are called driving-wheels, and are four, six, eight, or ten in number, dependent upon the desired traction or hauling power of the machine; this latter is, under ordinary circumstances, one-fourth of the weight borne on such driving-wheels, and the diameter of the cylinder and its stroke is usually proportioned so that
